1 L^AT_EX System Dependent Initializations

This file implements the semi-automatic determination of various system dependent parts of the initialization. The actual definitions may be placed in a file `texsys.cfg`. Thus for operating systems for which the tests here do not result in acceptable settings, a ‘hand written’ `texsys.cfg` may be produced.

The macros that must be defined are:

`\@currdir` `\@currdir{filename}{space}` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by `.` and/or `{space}`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `<dir>` is an entry in the input path, T_EX will try to load the expansion of `<dir>{filename}{space}`

So either `<dir>` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `<filename>`. This means that for UNIX-like syntax, each `<dir>` should end with a slash, `/`.

`\input@path` should expand to a list of such directories, each in a `{}` group.

`\filename@parse` After a call of the form: `\filename@parse{<filename>}`, the three macros `\filename@area`, `\filename@base` and `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `<filename>`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS and Macintosh syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS T_EX versions. Currently if the UNIX, VMS or Macintosh parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion` `\@TeXversion` is now set automatically by the initialization tests in this file. You should not need to set it in `texsys.cfg`, however the following documentation is left for information. L^AT_EX does not set this variable exactly, the automatic tests set it to:

2 for any version, v , $v < 3.0$

3 for any version, v , $3.0 \leq v \leq 3.14$

<undefined> otherwise.

However these values are accurate enough for L^AT_EX to take appropriate action for these old T_EXs.

If your T_EX is older than version 3.141, then you should define `\@TeXversion` (using `\def`) to be the version number. If you do not do this¹, L^AT_EX will not work around a bug in old T_EX versions, and so error messages will appear in a very strange format, with `^^J` appearing instead of line breaks:

```
LaTeX Error: \rubbish undefined.^^J^^JSee the LaTeX manual or LaTeX=
Companion
for explanation.^^JType H <return> for immediate help.
...

.3 \renewcommand{\rubbish}
      {}
```

However if you put `\def\@TeXversion{3.14}` in `texsys.cfg` the following format will be used:

```
LaTeX Error: \rubbish undefined.

ee the LaTeX manual or LaTeX Companion for explanation.
ype H <return> for immediate help.
.
...

.3 \renewcommand{\rubbish}
      {}
```

Note that this has an extra line ! . which does not appear in error messages that use the default settings with a current version of T_EX, but this should not cause any confusion we hope.

2 Initialization

As this file is read at a very early stage, some definitions that are normally considered to be part of the format must be made here.

2.1 INITEX

```
1 <*dircheck>
2 <*initex>
3 <initex>\ifnum\catcode'\{=1
4 <initex> \errmessage
5 <initex> {LaTeX must be made using an initex with no format preloaded}
6 <initex>\fi
7 \catcode'\{=1
```

¹Actually if your T_EX is really old, version 2, L^AT_EX can detect this, and sets `\@TeXversion` to 2 if it is not set in the `cfg` file.

```
8 \catcode'\}=2
```

If LuaTeX is in use the extensions and other new primitives have to be activated: this is done as early as possible. Older versions of LuaTeX do not hide the primitives: a version check is not needed as the version itself will be missing in the case where action is needed!

```
9 \ifx\directlua\undefined
10 \else
11 \ifx\luatexversion\undefined
```

Enable e-TeX/pdfTeX/Umath primitives with their natural names

```
12 \directlua{tex.enableprimitives("",%
13 tex.extraprimitives('etex', 'pdftex', 'umath'))}
```

In current formats enable primitives with unprefix names. the latexrelease guards allow the primitives to be defined with a \luatex prefix if older formats are specified.

```
14 \</initex>
15 \</dircheck>

3 texsys.cfg

As mentioned above, any site specific definitions required to describe the filename handling must be entered into a file `texsys.cfg`. If `texsys.cfg` can not be located by `\openin`, we write a default version out. The default version only contains comments, so we do not actually input the file in that case. The automatic tests later will, hopefully, correctly define the required macros.

The tricky code below checks to see if `texsys.cfg` exists. If it does not, all the text in this file between `START` and `END` is copied verbatim to a new file `texsys.cfg`. If `texsys.cfg` is found, then it is simply input. This is only done when this file is being used unstripped.

START

3.1 texsys.cfg

This file contains the site specific definitions of the four macros `\@currdir`, `\input@path`, `\filename@parse` and `\@TeXversion`.

As distributed it only contains comments, however this 'empty' file will work on many systems because of the automatic tests built into `ltdirchk.dtx`. You *are* allowed to edit this file to add definitions of these macros appropriate to your system.

The macros that must be defined are:

`\@currdir` `\@currdir{filename}<space>` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by `.` and/or `<space>`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `<dir>` is an entry in the input path, `TEX` will try to load the expansion of

`<dir><filename><space>`

So either `<dir>` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `<filename>`. This means that for UNIX-like syntax, each `<dir>` should end with a slash, `/`. One exception to this rule is that the input path should *always* contain the empty directory `{}` as this will allow ‘full pathnames’ to be used, and the ‘current directory’ to be searched.

`\input@path` should expand to a list of such directories, each in a `{}` group.

`\filename@parse` After a call of the form: `\filename@parse{<filename>}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `<filename>`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS `TEX` versions. Currently if the UNIX or VMS parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion` You should not need to set this macro in `texsys.cfg`. `LATEX` tests to set this automatically. See the comments in the opening section of `ltdirchk.dtx`.

The following sections give examples of definitions which might work on various systems. These are currently mainly untested as I only have access to a few systems, all of which do not need this file as the automatic tests work. All the code is commented out.

3.2 UNIX (web2c)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

130 `%\def\@currdir{./}`

131 `%\let\input@path\undefined`

3.3 UNIX (other)

Apparently some commercial UNIX implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`.

```
132 % \def\currdir{./}
133 % \def\input@path{%
134 %   {/usr/local/lib/tex/inputs/distrib/}%
135 %   {/usr/local/lib/tex/inputs/contrib/}%
136 %   {/usr/local/lib/tex/inputs/local/}%
137 % }
```

3.4 MSDOS (emtex)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
138 % \def\currdir{./}
139 % \let\input@path\undefined
```

3.5 MSDOS (other)

Some PC implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`. This assumes the implementation uses UNIX style `/` as the directory separator.

```
140 % \def\currdir{./}
141 % \def\input@path{%
142 %   {c:/tex/inputs/distrib/}%
143 %   {c:/tex/inputs/contrib/}%
144 %   {c:/tex/inputs/local/}%
145 % }
```

3.6 VMS (DECUS T_EX, PD VMS 3.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
146 % \def\currdir{[] }
147 % \let\input@path\undefined
```

3.7 VMS (???)

Some VMS implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following:

```
148 % \def\currdir{[] }
149 % \def\input@path{%
150 %   {tex_inputs:}%
151 %   {SOMEDISK:[SOME.TEXT.DIRECTORY]}%
152 % }
```

3.8 MACINTOSH (OzTeX 1.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
153 % \def\@currdir{:}
154 % \let\input@path\@undefined
```

3.9 MACINTOSH (other)

Some Macintosh implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever folders are used on your machine): note that the directory names should end with `:`, and they should contain *no* spaces.

```
155 % \def\@currdir{:}
156 % \def\input@path{%
157 %   {Hard-Disk:Applications:TeX:TeX-inputs:}%
158 %   {Hard-Disk:Applications:TeX:My-inputs:}%
159 % }
```

3.10 FAKE EXAMPLE

This example is for an operating system that has filenames of the form `<area>name`. For maximum compatibility with macro sets, you want `name.ext` to be mapped to `<ext>name`, and `<area>name.ext` to be mapped to `<area.ext>name`. `\input` does this mapping automatically, but `\openin` does not, and does not look in the same places as `\input`. `<>name` is the desired ‘current directory’ syntax.

the following code would possibly work:

```
160 % \def\@dir#1#2 {%
161 %   \@d@r{#1}#2..\@nil}
162 % \def\@d@r#1#2.#3.#4\@nil{%
163 %   <\ifx\@dir#1\@dir\else#1\ifx\@dir#3\@dir\else.\fi\fi#3>#2 }
164 %
165 % \def\@currdir{\@dir{}}
166 % \def\input@path{%
167 %   {\@dir{area.one}}}%
168 %   {\@dir{area.two}}}%
169 % }
```

END

```
170 \immediate\closeout15
```

If `texsys.cfg` did exist, then input it.

```
171 \else
172 \typeout{** Using the existing texsys.cfg}
173 \closein15
174 \input texsys.cfg
175 \fi
176 </docstrip>
```

If the stripped version of this file is being used (in `latex2e.ltx`) then `texsys.cfg` should be there, so just input it.

```
177 <dircheck>\input texsys.cfg
```

4 Setting \@currdir

`\@currdir` This is a local definition of `\IfFileExists`. It tries to relocate `texsys.aux`. If it succeeds, then the `\@currdir` syntax has been determined. If all the tests fail then `\@currdir` will be set to `\@empty`, and `ltxcheck` will warn of this when it checks the format.

```
178 \begingroup
179 \count@ \time
180 \divide \count@ 60
181 \count2 = - \count@
182 \multiply \count2 60
183 \advance \count2 \time
```

The current date and time stamp.

```
184 \edef \today {%
\today 185 \the \year / \two@digits {\the \month} / \two@digits {\the \day} : %
186 \two@digits {\the \count@} : \two@digits {\the \count2}}
```

Create a file `texsys.aux` (hopefully in the current directory), then try to locate it again.

```
187 \immediate \openout15 = texsys.aux
188 \immediate \write15 {\today ^^J}
189 \immediate \closeout15 %
```

`#1` is the file to try, `#2` is what to do on success, `#3` on failure. Note that this definition is overwritten later on again!

```
190 \def \IfFileExists#1#2#3{%
191 \openin \@inputcheck#1 %
192 \ifeof \@inputcheck
193 #3 \relax
194 \else
195 \read \@inputcheck to \reserved@a
196 \ifx \reserved@a \today
197 \typeout {#1 found} #2 \relax
198 \else
199 \typeout {BAD: old file \reserved@a (should be \today)} %
200 #3 \relax
201 \fi
202 \fi
203 \closein \@inputcheck}
204 \endlinechar = -1
```

If `\@currdir` has not been pre-defined in `texsys.cfg` then test for UNIX, VMS and Oz-TeX-Mac. syntax.

```
205 \ifx \@currdir \@undefined
206 \IfFileExists{./texsys.aux} {\gdef \@currdir{.}} %
207 {\IfFileExists{[]texsys.aux} {\gdef \@currdir{[]}} %
208 {\IfFileExists{:texsys.aux} {\gdef \@currdir{:}} {}}}
```

If it is still undefined at this point, all the above tests failed. Earlier versions interactively prompted for a definition at this point, but it seems impossible to reliably obtain information from users at this point in the installation. This version of the file produces

a format with no user-interaction. Later if the format is not suitable for the system, `texsys.cfg` may be edited and the format re-made.

```

209 \ifx\@currdir\undefined
210 \global\let\@currdir\empty
211 \typeout{^^J^^J%
212     !! No syntax for the current directory could be found^^J%
213 }%
214 \fi

```

Otherwise `\@currdir` was defined in `texsys.cfg`. In this case check that the syntax specified works on this system. (In case a complete \LaTeX system has been copied from one system to another.) If the test fails, give up. The installer should remove or correct the offending `texsys.cfg` and try again.

```

215 \else
216 \IfFileExists{\@currdir texsys.aux}{\}%
217 \edef\reserved@a{\errhelp{%
218     texsys.cfg specifies the current directory syntax to be^^J%
219     \meaning\@currdir^^J%
220     but this does not work on this system.^^J%
221     Remove texsys.cfg and restart.}}\reserved@a
222 \errmessage{Bad texsys.cfg file: \noexpand\@currdir}\@@end}

```

The version of `\@currdir` in `texsys.cfg` looks OK.

```

223 \fi

224 \immediate\closeout15 %
225 \endgroup

226 \typeout{^^J^^J%
227     \noexpand\@currdir set to:
228     \expandafter\strip@prefix\meaning\@currdir.^^J%
229 }

```

(End definition for \@currdir, \IfFileExists, and \today.)

Stop here if the file is being used unstripped.

```

230 <*docstrip>
231 \relax\endinput
232 </docstrip>

```

5 Setting `\input@path`

Earlier versions of this file attempted to automatically test whether `\input@path` was required, and interactively prompt for a path if necessary. This was not found to be very reliable. The first-time installer of $\text{\LaTeX} 2_{\epsilon}$ can not be expected to have enough information to supply the correct information to the prompts. Now the interaction is omitted. After the format is made the installer can attempt to run the test document `ltxcheck.tex` through $\text{\LaTeX} 2_{\epsilon}$. This will check, among other things, whether `texsys.cfg` will need to be edited and the format remade.

`\input@path` Now set up the `\input@path`.

`\input@path` should either be undefined, or a list of directories as described in the introduction.

```

233 \typeout{^^J%

```

```

234     Assuming \noexpand\openin and \noexpand\input^^J%
235     \ifx\input@path\@undefined
\input@path has not been pre-defined.
236         have the same search path.^^J%
237     \else
\input@path has been defined in texsys.cfg.
238         have different search paths.^^J%
239         LaTeX will use the path specified by \noexpand\input@path:^^J%
240     \fi
241 }

(End definition for \input@path.)

```

6 Filename Parsing

`\filename@parse` Split a filename into its components.

325 \fi

(End definition for \filename@parse.)

```

7 T_EX Versions

`\@TeXversion` T_EX versions older than 3.141 require `\@TeXversion` to be set. This can be determined automatically due to a trick suggested by Bernd Raichle. (Actually this will not always get the correct version number, eg T_EX3.14 would be detected as T_EX3, but L^AT_EX only needs to take account of T_EX's older than 3, or between 3 and 3.14.

```

326 \ifx\@TeXversion\undefined

333       \ifx\reserved@a\empty\else\gdef\@TeXversion{3}\fi}
334   \fi
335 \fi

(End definition for \@TeXversion.)

336 </dircheck>

```

8 ltxcheck.tex

After the format has been made, and `article.cls` moved with the other files to the ‘standard input directory’ as specified in `install.txt`, the format may be checked by running the file `ltxcheck.tex`.

File b

lplain.dtx

1 Plain T_EX

L^AT_EX includes almost all of the functionality of Knuth's original 'Basic Macros' That is, the plain T_EX format described in Appendix B of the T_EXBook. However, some of the user commands are not much use so, in order to save memory, we may remove them from the kernel into a package. Here is a list of the commands that may be removed (PROBABLY NOT COMPLETE).

```
\magstep      \magstephalf
\mathhexbox
\vglue        \vgl@
\hglue        \hgl@
```

This file is by now very small as most of it has been moved to more appropriate kernel files: it may disappear completely one day.

L^AT_EX font definitions are done using NFSS2 so none of PLAIN's font definitions are in L^AT_EX.

L^AT_EX has its own tabbing environment, so PLAIN's is disabled.

L^AT_EX uses its own output routine, so most of the plain one was removed.

```
1 (*2kernel)
2 \catcode'\{=1 % left brace is begin-group character
3 \catcode'\}=2 % right brace is end-group character
4 \catcode'\$=3 % dollar sign is math shift
5 \catcode'\&=4 % ampersand is alignment tab
6 \catcode'\#=6 % hash mark is macro parameter character
7 \catcode'\^=7 % circumflex and uparrow are for superscripts
8 \catcode'\_ =8 % underline and downarrow are for subscripts
9 \catcode'\^~I=10 % ascii tab is a blank space
10 \chardef\active=13 \catcode'\~=\active % tilde is active
11 \catcode'\^~L=\active \def^~L{\par}% ascii form-feed is \par
12 \message{catcodes,}
```

We had to define the \catcodes right away, before the message line, since \message uses the { and } characters. When INITEX (the T_EX initializer) starts up, it has defined the following \catcode values:

```
\catcode'\^~@=9 %  ascii null is ignored
\catcode'\^~M=5 %  ascii return is end-line
\catcode'\ =0 %    backslash is TeX escape character
\catcode'\%=14 %   percent sign is comment character
\catcode'\ =10 %   ascii space is blank space
\catcode'\^~?=15 %  ascii delete is invalid
\catcode'\A=11 ... \catcode'\Z=11 % uppercase letters
\catcode'\a=11 ... \catcode'\z=11 % lowercase letters
all others are type 12 (other)
```

Here is a list of the characters that have been specially catcoded:

```
13 \def\dospecials{\do\ \do\\\do\{\do\}\do\$ \do\&%
14 \do\# \do\^ \do\_ \do\% \do\~}
```

(not counting ascii null, tab, linefeed, formfeed, return, delete) Each symbol in the list is preceded by , which can be defined if you want to do something to every item in the list.

We make @ signs act like letters, temporarily, to avoid conflict between user names and internal control sequences of plain format.

```
15 \catcode'\@=11
```

To make the plain macros more efficient in time and space, several constant values are declared here as control sequences. If they were changed, anything could happen; so they are private symbols.

`\@ne` Small constants are defined using `\chardef`.

```
\tw@ 16 \chardef\@ne=1
\thr@@ 17 \chardef\tw@=2
\sixt@@n 18 \chardef\thr@@=3
\@cclv 19 \chardef\sixt@@n=16
20 \chardef\@cclv=255
```

(End definition for \@ne and others.)

`\@cclvi` Constants above 255 defined using `\mathchardef`.

```
\@m 21 \mathchardef\@cclvi=256
\@M 22 \mathchardef\@m=1000
\@MM 23 \mathchardef\@M=10000
24 \mathchardef\@MM=20000
```

(End definition for \@cclvi and others.)

Allocation of registers

Here are macros for the automatic allocation of `\count`, `\box`, `\dimen`, `\skip`, `\muskip`, and `\toks` registers, as well as `\read` and `\write` stream numbers, `\fam` codes, `\language` codes, and `\insert` numbers.

```
25 \message{registers,}
```

When a register is used only temporarily, it need not be allocated; grouping can be used, making the value previously in the register return after the close of the group. The main use of these macros is for registers that are defined by one macro and used by others, possibly at different nesting levels. All such registers should be defined through these macros; otherwise conflicts may occur, especially when two or more macro packages are being used at the same time.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

The following counters are reserved:

- 0 to 9 page numbering
- 10 count allocation
- 11 dimen allocation
- 12 skip allocation
- 13 muskip allocation
- 14 box allocation
- 15 toks allocation
- 16 read file allocation
- 17 write file allocation
- 18 math family allocation
- 19 language allocation
- 20 insert allocation
- 21 the most recently allocated number

22 constant -1

End of historical L^AT_EX 2.09 comments.

New counters are allocated starting with 23, 24, etc. Other registers are allocated starting with 10. This leaves 0 through 9 for the user to play with safely, except that counts 0 to 9 are considered to be the page and subpage numbers (since they are displayed during output). In this scheme, `\count 10` always contains the number of the highest-numbered counter that has been allocated, `\count 14` the highest-numbered box, etc. Inserts are given numbers 254, 253, etc., since they require a `\count`, `\dimen`, `\skip`, and `\box` all with the same number; `\count 20` contains the lowest-numbered insert that has been allocated. Of course, `\box255` is reserved for `\output`; `\count255`, `\dimen255`, and `\skip255` can be used freely.

It is recommended that macro designers always use `\global` assignments with respect to registers numbered

1, 3, 5, 7, 9,

and always non-`\global` assignments with respect to registers

0, 2, 4, 6, 8, 255.

This will prevent “save stack buildup” that might otherwise occur.

```
26 \count10=22 % allocates \count registers 23, 24, ...
27 \count11=9 % allocates \dimen registers 10, 11, ...
28 \count12=9 % allocates \skip registers 10, 11, ...
29 \count13=9 % allocates \muskip registers 10, 11, ...
30 \count14=9 % allocates \box registers 10, 11, ...
31 \count15=9 % allocates \toks registers 10, 11, ...
32 \count16=-1 % allocates input streams 0, 1, ...
33 \count17=-1 % allocates output streams 0, 1, ...
34 \count18=3 % allocates math families 4, 5, ...
35 \count19=0 % allocates \language codes 1, 2, ...
36 \count20=255 % allocates insertions 254, 253, ...
```

```
\insc@unt The insertion counter and most recent allocation.
\allocationnumber
37 \countdef\insc@unt=20
38 \countdef\allocationnumber=21
```

(End definition for \insc@unt and \allocationnumber.)

```
\m@ne The constant -1.
39 \countdef\m@ne=22 \m@ne=-1
```

(End definition for \m@ne.)

```
\wlog Write on log file (only)
40 \def\wlog{\immediate\write\m@ne}
```

(End definition for \wlog.)

```
\count@ Here are abbreviations for the names of scratch registers that don't need to be allocated.
\dimen@ 41 \countdef\count@=255
\dimen@i 42 \dimendef\dimen@=0
\dimen@ii 43 \dimendef\dimen@i=1 % global only
\skip@ 44 \dimendef\dimen@ii=2
\toks@ 45 \skipdef\skip@=0
46 \toksdef\toks@=0
```

(End definition for \count@ and others.)

```

\newcount Now, we define \newcount, \newbox, etc. so that you can say \newcount\foo and \foo
\newdimen will be defined (with \countdef) to be the next counter.
\newskip To find out which counter \foo is, you can look at \allocationnumber.
\newmuskip Since there's no \boxdef command, \chardef is used to define a \newbox,
\newbox \newinsert, \newfam, and so on.
\newtoks LATEX change: remove \outer from \newcount and \newdimen (FMi) This is nec-
\newread essary to use \newcount inside \if... later on. Also remove from \newskip, \newbox
\newwrite \newwrite and \newfam (DPC) to save later redefinition.
\newfam

      (End definition for \bgroup and \egroup.)

\obeylines In \obeylines, we say \let^^M=\par instead of \def^^M{\par} since this allows, for
\obeyspaces example, \let\par=\cr \obeylines \halign{...
          385 {\catcode'\^^M=\active % these lines must end with %
          386 \gdef\obeylines{\catcode'\^^M\active \let^^M\par}%
          387 \global\let^^M\par} % this is in case ^^M appears in a \write
          388 \def\obeyspaces{\catcode'\ \active}
          389 {\obeyspaces\global\let \space=}

      (End definition for \obeylines and \obeyspaces.)

```

`\loop` We use Kabelschacht's method of doing loops, see TUB 8#2 (1987). (unless that breaks something :-). It turned out to need an extra `\relax`: see pr/642 (`\loop` could do one iteration too much in certain cases).

```

390 \long\def \loop #1\repeat{%
391   \def\iterate{#1\relax % Extra \relax
392             \expandafter\iterate\fi
393             }%
394   \iterate
395   \let\iterate\relax
396 }

```

This setting of `\repeat` is needed to make `\loop...\if...\repeat` skippable within another `\if....`

```

397 \let\repeat=\fi

```

(End definition for \loop, \iterate, and \repeat.)

L^AT_EX defines `\smallskip`, etc. in `ltspace.dtx`.

`\nointerlineskip`
`\offinterlineskip`

```

398 \def\nointerlineskip{\prevdepth-\@m\p@}
399 \def\offinterlineskip{\baselineskip-\@m\p@
400   \lineskip\z@ \lineskiplimit\maxdimen}

```

(End definition for \nointerlineskip and \offinterlineskip.)

`\vglue`
`\hglue`

```

401 \def\vglue{\afterassignment\vgl@ \skip@=}
402 \def\vgl@{\par \dimen@ \prevdepth \hrule \@height\z@
403   \nobreak\vskip\skip@ \prevdepth\dimen@}
404 \def\hglue{\afterassignment\hgl@ \skip@=}
405 \def\hgl@{\leavevmode \count@ \spacefactor \vrule \@width\z@
406   \nobreak\hskip\skip@ \spacefactor\count@}

```

(End definition for \vglue and \hglue.)

L^AT_EX defines `~` in `ltdefs.dtx`.

`\slash` This generates a / acting a bit like - but still allows hyphenation in the word part preceding it (but not after).

```

407 \def\slash{/ \penalty\exhyphenpenalty}

```

(End definition for \slash.)

`\break`
`\nobreak`
`\allowbreak`

```

408 \def\break{\penalty-\@M}
409 \def\nobreak{\penalty \@M}
410 \def\allowbreak{\penalty \z@}

```

(End definition for \break, \nobreak, and \allowbreak.)

`\filbreak`
`\goodbreak`

```

411 \def\filbreak{\par\vfil\penalty-200\vfilneg}
412 \def\goodbreak{\par\penalty-500 }

```

(End definition for \filbreak and \goodbreak.)

`\eject` Define `\eject` as in plain T_EX but define `\supereject` only in the compatibility file.

```

413 \def\eject{\par\break}

(End definition for \eject.)

```

`\remove alastskip`

```

414 \def\remove alastskip{\ifdim\lastskip=\z@\else\vskip-\lastskip\fi}

(End definition for \remove alastskip.)

```

`\smallbreak`
`\medbreak`
`\bigbreak`

```

415 \def\smallbreak{\par\ifdim\lastskip<\smallskipamount
416   \remove alastskip\penalty-50\smallskip\fi}
417 \def\medbreak{\par\ifdim\lastskip<\medskipamount
418   \remove alastskip\penalty-100\medskip\fi}
419 \def\bigbreak{\par\ifdim\lastskip<\bigskipamount
420   \remove alastskip\penalty-200\bigskip\fi}

(End definition for \smallbreak, \medbreak, and \bigbreak.)

```

`\m@th`

```

421 \def\m@th{\mathsurround\z@}

(End definition for \m@th.)

```

`\underbar` Due to L^AT_EX's redefinition of `\underline` plain T_EX's `\underbar` can be done in a simpler fashion (but do we need it at all?).

```

422 \def\underbar#1{\underline{\sbox\tw@{#1}\dp\tw@=\z@\box\tw@}}

(End definition for \underbar.)

```

`\strutbox` L^AT_EX sets `\strutbox` in `\set@fontsize`.

```

423 \newbox\strutbox
424 \def\strut{\relax\ifmmode\copy\strutbox\else\unhcopy\strutbox\fi}

(End definition for \strutbox and \strut.)

```

`\hidewidth` For alignment entries that can stick out.

```

425 \def\hidewidth{\hskip\hideskip}

(End definition for \hidewidth.)

```

`\narrower`

```

426 \def\narrower{%
427   \advance\leftskip\parindent
428   \advance\rightskip\parindent}

(End definition for \narrower.)

```

L^AT_EX defines `\ae` and similar commands elsewhere.

```

429 \chardef\%= '\%
430 \chardef\&= '\&
431 \chardef\#= '\#

```

Most text commands are actually encoding specific and therefore defined later, so commented out or removed from this file.

`\leavevmode` begins a paragraph, if necessary

```

432 \def\leavevmode{\unhbox\voidb@x}

(End definition for \leavevmode.)

```

`\mathhexbox`

```

433 \def\mathhexbox#1#2#3{\mbox{$\m@th \mathchar"#1#2#3$}}

(End definition for \mathhexbox.)

```

`\ialign`

```

434 \def\ialign{\everycr{}\tabskip\z@skip\halign} % initialized \halign

(End definition for \ialign.)

```

`\oalign`

```

435 \def\oalign#1{\leavevmode\topof\baselineskip\z@skip \lineskip.25ex%
436 \ialign{##\crr#1\crr}}
437 \def\o@lign{\lineskiplimit\z@ \oalign}
438 \def\oalign{\lineskiplimit-\maxdimen \oalign}

(End definition for \oalign, \o@lign, and \oalign.)

```

`\sh@ft` The definition of this macro in plain.tex was improved in about 1997; but as a result its usage was changed and its new definition is not appropriate for L^AT_EX.

Since the version given here has been in use by L^AT_EX for many years it does not seem prudent to remove it now. As far as we can tell it has only been used to define `\b` and `\d` but this cannot be certain.

```

439 \def\sh@ft#1{\dimen@.00#1ex\multiply\dimen@\fontdimen1\font
440 \kern-.0156\dimen@} % compensate for slant in lowered accents

(End definition for \sh@ft.)

```

`\ltx@sh@ft` This is the L^AT_EX version of the second incarnation of the plain macro `\sh@ft`, which takes a dimension as its argument. It shifts a pseudo-accent horizontally by an amount proportional to the product of its argument and the slant-per-point (`fontdimen 1`).

```

441 \def\ltx@sh@ft #1{%
442 \dimen@ #1%
443 \kern \strip@pt
444 \fontdimen1\font \dimen@
445 } % kern by #1 times the current slant

(End definition for \ltx@sh@ft.)

```

L^AT_EX change: the text commands such as `\d`, `\b`, `\c`, `\copyright`, `\TeX` are now defined elsewhere.

L^AT_EX change: Make `\t` work in a moving argument. Now defined elsewhere.

`\hrulefill` L^AT_EX change: `\kern\z@` added to end of `\hrulefill` and `\dotfill` to make them work

`\dotfill` in ‘tabular’ and ‘array’ environments. (Change made 24 July 1987). L^AT_EX change: `\leavevmode` added at beginning of `\dotfill` and `\hrulefill` so that they work as expected in vertical mode.

```

446 \def\hrulefill{\leavevmode\leaders\hrule\hfill\kern\z@}

```

The box in `\dotfill` originally contained (in `plain.tex`):

```
\mkern 1.5mu .\mkern 1.5mu;
```

the width of `.44em` differs from this by `.04pt` which is probably an acceptable difference within leaders.

```
447 \def\dotfill{%
448   \leavevmode
449   \cleaders \hb@xt@ .44em{\hss.\hss}\hfill
450   \kern\z@}
```

(End definition for `\hrulefill` and `\dotfill`.)

INITEX sets `\sfcode x=1000` for all `x`, except that `\sfcode'X=999` for uppercase letters. The following changes are needed:

```
451 \sfcode'\=0 \sfcode'\'=0 \sfcode'\]=0
```

The `\nonfrenchspacing` macro will make further changes to `\sfcode` values.

Definitions related to output

`\magnification` doesn't work in L^AT_EX.

```
def\magnification{\afterassignment\m@g\count@}
def\m@g{\mag\count@
  \hsize6.5truein\vsize8.9truein\dimen\footins8truein}
```

`\showoverfull` The following commands are used in debugging:

```
452 \def\showoverfull{\tracingonline\@ne}
```

(End definition for `\showoverfull`.)

`\showoutput`
`\loggingoutput`

File c

ltvers.dtx

1 Version Identification

First we identify the date and version number of this release of L^AT_EX, and set `\everyjob` so that it is printed at the start of every L^AT_EX run.

`\fmtname` A `\patch@level` of 0 or higher denotes an official public release. A negative value indicates a candidate release that is not distributed.

`\fmtversion`

`\latexreleaseversion` If we put code updates into the kernel that are supposed to go into the next release we set the `\patch@level` to -1 and the `\fmtversion` / `\latexreleaseversion` to the dated of the next release (guessed, the real value is not so important and will get corrected when we make the release official).

`\patch@level`

If the `\patch@level` is already at -1 we do nothing here and use the `\fmtversion` date for any new `\IncludeInRelease` line when we add further code.

Finally, if we do make a public release we either just set the `\patch@level` to zero (if our initial guess was good) or we also change the date and then have to additionally change to that date on all the `\IncludeInRelease` statements that used the “guessed” date.

```

9 <*2ekernel>
10 \def\patch@level{-2}
```

For more fine grain control there is the possibility to name the current development branch. This is only used when the `\patch@level` is negative (i.e., a pre-release format) and is intended to help us internally when we locally install a format out of some development branch.

```
\development@branch@name 11 \edef\development@branch@name{develop \the\year-\the\month-\the\day}
```

(End definition for `\fmtname` and others.)

Check that the format being made is not too old. The error message complains about ‘more than 5 years’ but in fact the error is not triggered until 65 months.

This code is currently not activated as we don’t know if we already got to the last official 2e version (due to staff shortage or due to a successor (think positive:-)).

```

```

If we roll back and the first patch already match then applying that is actually reapplying what is already in the format, i.e., it is useless and possibly allocating new registers. However, it makes the logic simpler so this is the way it is for now. In theory we could always jump over the first patch because that is only really needed for rolling forward. So maybe one day ...

(End definition for \IncludeInRelease.)

File d

lualatex.dtx

1 Overview

LuaTeX adds a number of engine-specific functions to TeX. Several of these require set up that is best done in the kernel or need related support functions. This file provides *basic* support for LuaTeX at the L^AT_ΕX 2_ε kernel level plus as a loadable file which can be used with plain TeX and L^AT_ΕX.

This file contains code for both TeX (to be stored as part of the format) and Lua (to be loaded at the start of each job). In the Lua code, the kernel uses the namespace `luatexbase`.

The following `\count` registers are used here for register allocation:

```
\e@alloc@attribute@count Attributes (default 258)
\e@alloc@ccodetable@count Category code tables (default 259)
\e@alloc@luafunction@count Lua functions (default 260)
  \e@alloc@whatsit@count User whatsits (default 261)
  \e@alloc@bytecode@count Lua bytecodes (default 262)
  \e@alloc@luachunk@count Lua chunks (default 263)
```

(`\count 256` is used for `\newmarks` allocation and `\count 257` is used for `\newXeTeXintercharclass` with XeTeX, with code defined in `ltxfinal.dtx`). With any L^AT_ΕX 2_ε kernel from 2015 onward these registers are part of the block in the extended area reserved by the kernel (prior to 2015 the L^AT_ΕX 2_ε kernel did not provide any functionality for the extended allocation area).

2 Core TeX functionality

The commands defined here are defined for possible inclusion in a future L^AT_ΕX format, however also extracted to the file `lualatex.tex` which may be used with older L^AT_ΕX formats, and with plain TeX.

<code>\newattribute</code>	<code>\newattribute{<attribute>}</code> Defines a named <code>\attribute</code> , indexed from 1 (<i>i.e.</i> <code>\attribute0</code> is never defined). Attributes initially have the marker value <code>-7FFFFFFF</code> ('unset') set by the engine.
<code>\newcatcodetable</code>	<code>\newcatcodetable{<catcodetable>}</code> Defines a named <code>\catcodetable</code> , indexed from 1 (<code>\catcodetable0</code> is never assigned). A new catcode table will be populated with exactly those values assigned by IniTeX (as described in the LuaTeX manual).
<code>\newluafunction</code>	<code>\newluafunction{<function>}</code> Defines a named <code>\luafunction</code> , indexed from 1. (Lua indexes tables from 1 so <code>\luafunction0</code> is not available).
<code>\newwhatsit</code>	<code>\newwhatsit{<whatsit>}</code> Defines a custom <code>\whatsit</code> , indexed from 1.
<code>\newluabytecode</code>	<code>\newluabytecode{<bytecode>}</code>

	Allocates a number for Lua bytecode register, indexed from 1.
<code>\newluachunkname</code>	<code>newluachunkname{⟨chunkname⟩}</code> Allocates a number for Lua chunk register, indexed from 1. Also enters the name of the register (without backslash) into the <code>lua.name</code> table to be used in stack traces.
<code>\catcodetable@initex</code>	Predefined category code tables with the obvious assignments. Note that the <code>latex</code> and
<code>\catcodetable@string</code>	<code>atletter</code> tables set the full Unicode range to the codes predefined by the kernel.
<code>\catcodetable@latex</code>	<code>\setattribute{⟨attribute⟩}{⟨value⟩}</code>
<code>\catcodetable@atletter</code>	<code>\unsetattribute{⟨attribute⟩}</code>
<code>\setattribute</code>	Set and unset attributes in a manner analogous to <code>\setlength</code> . Note that attributes
<code>\unsetattribute</code>	take a marker value when unset so this operation is distinct from setting the value to zero.

3 Plain T_EX interface

The `luatex` interface may be used with plain T_EX using `\input{luatex}`. This inputs `luatex.tex` which inputs `etex.src` (or `etex.sty` if used with L^AT_EX) if it is not already input, and then defines some internal commands to allow the `luatex` interface to be defined.

The `luatexbase` package interface may also be used in plain T_EX, as before, by inputting the package `\input luatexbase.sty`. The new version of `luatexbase` is based on this `luatex` code but implements a compatibility layer providing the interface of the original package.

4 Lua functionality

4.1 Allocators in Lua

<code>new_attribute</code>	<code>luatexbase.new_attribute(⟨attribute⟩)</code> Returns an allocation number for the <code>⟨attribute⟩</code> , indexed from 1. The attribute will be initialised with the marker value <code>-"7FFFFFFF</code> ('unset'). The attribute allocation sequence is shared with the T _E X code but this function does <i>not</i> define a token using <code>\attributedef</code> . The attribute name is recorded in the <code>attributes</code> table. A metatable is provided so that the table syntax can be used consistently for attributes declared in T _E X or Lua.
<code>new_whatsit</code>	<code>luatexbase.new_whatsit(⟨whatsit⟩)</code> Returns an allocation number for the custom <code>⟨whatsit⟩</code> , indexed from 1.
<code>new_bytecode</code>	<code>luatexbase.new_bytecode(⟨bytecode⟩)</code> Returns an allocation number for a bytecode register, indexed from 1. The optional <code>⟨name⟩</code> argument is just used for logging.
<code>new_chunkname</code>	<code>luatexbase.new_chunkname(⟨chunkname⟩)</code> Returns an allocation number for a Lua chunk name for use with <code>\directlua</code> and <code>\latelua</code> , indexed from 1. The number is returned and also <code>⟨name⟩</code> argument is added to the <code>lua.name</code> array at that index.
<code>new_luafunction</code>	<code>luatexbase.new_luafunction(⟨functionname⟩)</code> Returns an allocation number for a lua function for use with <code>\luafunction</code> , <code>\lateluafunction</code> , and <code>\luaodef</code> , indexed from 1. The optional <code>⟨functionname⟩</code> argument is just used for logging.

These functions all require access to a named T_EX count register to manage their allocations. The standard names are those defined above for access from T_EX,

e.g. `\e@alloc@attribute@count`, but these can be adjusted by defining the variable `\type_count_name` before loading `ltnlualatex.lua`, for example

```
local attribute_count_name = "attributetracker"
require("ltnlualatex")
```

would use a \TeX `\count` (`\countdef`'d token) called `attributetracker` in place of `\e@alloc@attribute@count`.

4.2 Lua access to \TeX register numbers

`registernumber` `luatexbase.registernumber(<name>)`
 Sometimes (notably in the case of Lua attributes) it is necessary to access a register *by number* that has been allocated by \TeX . This package provides a function to look up the relevant number using Lua \TeX 's internal tables. After for example `\newattribute\myattrib`, `\myattrib` would be defined by (say) `\myattrib=\attribute15`. `luatexbase.registernumber("myattrib")` would then return the register number, 15 in this case. If the string passed as argument does not correspond to a token defined by `\attributedef`, `\countdef` or similar commands, the Lua value `false` is returned.

As an example, consider the input:

```
\newcommand\test[1]{%
\typeout{#1: \expandafter\meaning\csname#1\endcsname^^J
\space\space\space\space
\directlua{tex.write(luatexbase.registernumber("#1") or "bad input")}}%
}

\test{undefinedrubbish}

\test{space}

\test{hbox}

\test{@MM}

\test{@tempdima}
\test{@tempdimb}

\test{strutbox}

\test{sixt@@n}

\attributedef\myattr=12
\myattr=200
\test{myattr}
```

If the demonstration code is processed with Lua \TeX then the following would be produced in the log and terminal output.

```
undefinedrubbish: \relax
      bad input
```

```

space: macro:->
    bad input
hbox: \hbox
    bad input
@MM: \mathchar"4E20
    20000
@tempdima: \dimen14
    14
@tempdimb: \dimen15
    15
strutbox: \char"B
    11
sist@@n: \char"10
    16
myattr: \attribute12
    12

```

Notice how undefined commands, or commands unrelated to registers do not produce an error, just return `false` and so print `bad input` here. Note also that commands defined by `\newbox` work and return the number of the box register even though the actual command holding this number is a `\chardef` defined token (there is no `\boxdef`).

4.3 Module utilities

`provides_module` `luatexbase.provides_module(<info>)`

This function is used by modules to identify themselves; the `info` should be a table containing information about the module. The required field `name` must contain the name of the module. It is recommended to provide a field `date` in the usual L^AT_EX format `yyyy/mm/dd`. Optional fields `version` (a string) and `description` may be used if present. This information will be recorded in the log. Other fields are ignored.

`module_info` `luatexbase.module_info(<module>, <text>)`

`module_warning` `luatexbase.module_warning(<module>, <text>)`

`module_error` `luatexbase.module_error(<module>, <text>)`

These functions are similar to L^AT_EX's `\PackageError`, `\PackageWarning` and `\PackageInfo` in the way they format the output. No automatic line breaking is done, you may still use `\n` as usual for that, and the name of the package will be prepended to each output line.

Note that `luatexbase.module_error` raises an actual Lua error with `error()`, which currently means a call stack will be dumped. While this may not look pretty, at least it provides useful information for tracking the error down.

4.4 Callback management

`add_to_callback` `luatexbase.add_to_callback(<callback>, <function>, <description>)` Registers the *<function>* into the *<callback>* with a textual *<description>* of the function. Functions are inserted into the callback in the order loaded.

`remove_from_callback` `luatexbase.remove_from_callback(<callback>, <description>)` Removes the callback function with *<description>* from the *<callback>*. The removed function and its description are returned as the results of this function.

`in_callback` `luatexbase.in_callback(<callback>, <description>)` Checks if the *<description>* matches one of the functions added to the list for the *<callback>*, returning a boolean value.

<code>disable_callback</code>	<code>luatexbase.disable_callback(<callback>)</code> Sets the <code><callback></code> to <code>false</code> as described in the LuaTeX manual for the underlying <code>callback.register</code> built-in. Callbacks will only be set to false (and thus be skipped entirely) if there are no functions registered using the callback.
<code>callback_descriptions</code>	A list of the descriptions of functions registered to the specified callback is returned. <code>{}</code> is returned if there are no functions registered.
<code>create_callback</code>	<code>luatexbase.create_callback(<name>,metatype,<default>)</code> Defines a user defined callback. The last argument is a default function or <code>false</code> .
<code>call_callback</code>	<code>luatexbase.call_callback(<name>,...)</code> Calls a user defined callback with the supplied arguments.

5 Implementation

```

1 <*2ekernel | tex | latexrelease>
2 <2ekernel | latexrelease>\ifx\directlua\@undefined\else

```

5.1 Minimum LuaTeX version

LuaTeX has changed a lot over time. In the kernel support for ancient versions is not provided: trying to build a format with a very old binary therefore gives some information in the log and loading stops. The cut-off selected here relates to the tree-searching behaviour of `require()`: from version 0.60, LuaTeX will correctly find Lua files in the `texmf` tree without ‘help’.

```

3 <latexrelease>\IncludeInRelease{2015/10/01}
4 <latexrelease>                {\newluafunction}{LuaTeX}%
5 \ifnum\luatexversion<60 %
6   \wlog{*****}
7   \wlog{* LuaTeX version too old for ltuatex support *}
8   \wlog{*****}
9   \expandafter\endinput
10 \fi

```

Two simple L^AT_EX macros from `ltdfn.s.dtx` have to be defined here because `ltdfn.s.dtx` is not loaded yet when `ltluatex.dtx` is executed.

```

11 \long\def\@gobble#1{}
12 \long\def\@firstofone#1{#1}

```

5.2 Older L^AT_EX/Plain T_EX setup

```

13 <*tex>

```

Older L^AT_EX formats don’t have the primitives with ‘native’ names: sort that out. If they already exist this will still be safe.

```

14 \directlua{tex.enableprimitives("",tex.extraprimitives("luatex"))}
15 \ifx\@alloc\@undefined

```

In pre-2014 L^AT_EX, or plain T_EX, load `etex.{sty,src}`.

```

16 \ifx\documentclass\@undefined
17   \ifx\loccount\@undefined
18     \input{etex.src}%
19   \fi
20   \catcode'\@=11 %
21   \outer\expandafter\def\csname newfam\endcsname

```

```

22                                     {\alloc@8\fam\chardef\et@xmaxfam}
23 \else
24   \RequirePackage{etex}
25   \expandafter\def\csname newfam\endcsname
26                                     {\alloc@8\fam\chardef\et@xmaxfam}
27   \expandafter\let\expandafter\new@mathgroup\csname newfam\endcsname
28 \fi

```

5.2.1 Fixes to etex.src/etex.sty

These could and probably should be made directly in an update to `etex.src` which already has some LuaTeX-specific code, but does not define the correct range for LuaTeX. 2015-07-13 higher range in luatex.

```

29 \edef \et@xmaxregs {\ifx\directlua\@undefined 32768\else 65536\fi}

```

luatex/xetex also allow more math fam.

```

30 \edef \et@xmaxfam {\ifx\Umathcode\@undefined\sixt@@n\else\ccclvi\fi}
31 \count 270=\et@xmaxregs % locally allocates \count registers
32 \count 271=\et@xmaxregs % ditto for \dimen registers
33 \count 272=\et@xmaxregs % ditto for \skip registers
34 \count 273=\et@xmaxregs % ditto for \muskip registers
35 \count 274=\et@xmaxregs % ditto for \box registers
36 \count 275=\et@xmaxregs % ditto for \toks registers
37 \count 276=\et@xmaxregs % ditto for \marks classes

```

and 256 or 16 fam. (Done above due to plain/LaTeX differences in ltuatex.)

```

38 % \outer\def\newfam{\alloc@8\fam\chardef\et@xmaxfam}

```

End of proposed changes to `etex.src`

5.2.2 luatex specific settings

Switch to global cf `luatex.sty` to leave room for inserts not really needed for luatex but possibly most compatible with existing use.

```

39 \expandafter\let\csname newcount\expandafter\expandafter\endcsname
40   \csname globcount\endcsname
41 \expandafter\let\csname newdimen\expandafter\expandafter\endcsname
42   \csname globdimen\endcsname
43 \expandafter\let\csname newskip\expandafter\expandafter\endcsname
44   \csname globskip\endcsname
45 \expandafter\let\csname newbox\expandafter\expandafter\endcsname
46   \csname globbox\endcsname

```

Define `\e@alloc` as in latex (the existing macros in `etex.src` hard to extend to further register types as they assume specific 26x and 27x count range. For compatibility the existing register allocation is not changed.

```

47 \chardef\e@alloc@top=65535
48 \let\e@alloc\chardef\chardef
49 \def\e@alloc#1#2#3#4#5#6{%
50   \global\advance#3\@ne
51   \e@ch@ck{#3}{#4}{#5}#1%
52   \allocationnumber#3\relax
53   \global#2#6\allocationnumber
54   \wlog{\string#6=\string#1\the\allocationnumber}}%

```

```

55 \gdef\ech@ck#1#2#3#4{%
56   \ifnum#1<#2\else
57     \ifnum#1=#2\relax
58       #1\ccclvi
59       \ifx\count#4\advance#1 10 \fi
60     \fi
61     \ifnum#1<#3\relax
62     \else
63       \errmessage{No room for a new \string#4}%
64     \fi
65   \fi}%

```

Fix up allocations not to clash with etex.src.

```

66 \expandafter\csname newcount\endcsname\@alloc@attribute@count
67 \expandafter\csname newcount\endcsname\@alloc@ccodetable@count
68 \expandafter\csname newcount\endcsname\@alloc@luafunction@count
69 \expandafter\csname newcount\endcsname\@alloc@whatsit@count
70 \expandafter\csname newcount\endcsname\@alloc@bytecode@count
71 \expandafter\csname newcount\endcsname\@alloc@luachunk@count

```

End of conditional setup for plain T_EX / old L^AT_EX.

```

72 \fi
73 \</tex>

```

5.3 Attributes

\newattribute As is generally the case for the LuaT_EX registers we start here from 1. Notably, some code assumes that `\attribute0` is never used so this is important in this case.

```

74 \ifx\@alloc@attribute@count\@undefined
75   \countdef\@alloc@attribute@count=258
76   \@alloc@attribute@count=\z@
77 \fi
78 \def\newattribute#1{%
79   \@alloc\attribute\attributedef
80   \@alloc@attribute@count\m@ne\@alloc@top#1%
81 }

```

(End definition for `\newattribute`.)

\setattribute Handy utilities.
\unsetattribute

```

82 \def\setattribute#1#2{#1=\numexpr#2\relax}
83 \def\unsetattribute#1{#1=-"7FFFFFFF\relax}

```

(End definition for `\setattribute` and `\unsetattribute`.)

5.4 Category code tables

\newcatcodetable Category code tables are allocated with a limit half of that used by LuaT_EX for everything else. At the end of allocation there needs to be an initialization step. Table 0 is already taken (it's the global one for current use) so the allocation starts at 1.

```

84 \ifx\@alloc@ccodetable@count\@undefined
85   \countdef\@alloc@ccodetable@count=259
86   \@alloc@ccodetable@count=\z@
87 \fi

```

```

88 \def\newcatcodetable#1{%
89   \e@alloc\catcodetable\chardef
90   \e@alloc\ccodetable@count\m@ne{"8000}#1%
91   \initcatcodetable\allocationnumber
92 }

```

(End definition for \newcatcodetable.)

```

\catcodetable@initex Save a small set of standard tables. The Unicode data is read here in using a parser sim-
\catcodetable@string plified from that in load-unicode-data: only the nature of letters needs to be detected.
\catcodetable@latex
\catcodetable@atletter
93 \newcatcodetable\catcodetable@initex
94 \newcatcodetable\catcodetable@string
95 \begingroup
96   \def\setrangecatcode#1#2#3{%

(End definition for \catcodetable@initex and others.)

5.5 Named Lua functions

`\newluafunction` Much the same story for allocating LuaTeX functions except here they are just numbers so they are allocated in the same way as boxes. Lua indexes from 1 so once again slot 0 is skipped.

```

173 \ifx\e@alloc@luafunction@count\@undefined
174     \countdef\e@alloc@luafunction@count=260
175     \e@alloc@luafunction@count=\z@
176 \fi
177 \def\newluafunction{%
178     \e@alloc@luafunction\e@alloc@chardef
179     \e@alloc@luafunction@count\m@ne\e@alloc@top
180 }

```

(End definition for \newluafunction.)

5.6 Custom whatsits

`\newwhatsit` These are only settable from Lua but for consistency are definable here.

```
181 \ifx\e@alloc@whatsit@count\@undefined
182   \countdef\e@alloc@whatsit@count=261
183   \e@alloc@whatsit@count=\z@
184 \fi
185 \def\newwhatsit#1{%
186   \e@alloc@whatsit\e@alloc@chardef
187   \e@alloc@whatsit@count\m@ne\e@alloc@top#1%
188 }
```

(End definition for \newwhatsit.)

5.7 Lua bytecode registers

`\newluabytocode` These are only settable from Lua but for consistency are definable here.

```
189 \ifx\e@alloc@bytocode@count\@undefined
190   \countdef\e@alloc@bytocode@count=262
191   \e@alloc@bytocode@count=\z@
192 \fi
193 \def\newluabytocode#1{%
194   \e@alloc@luabytocode\e@alloc@chardef
195   \e@alloc@bytocode@count\m@ne\e@alloc@top#1%
196 }
```

(End definition for \newluabytocode.)

5.8 Lua chunk registers

`\newluachunkname` As for bytecode registers, but in addition we need to add a string to the `lua.name` table to use in stack tracing. We use the name of the command passed to the allocator, with no backslash.

```
197 \ifx\e@alloc@luachunk@count\@undefined
198   \countdef\e@alloc@luachunk@count=263
199   \e@alloc@luachunk@count=\z@
200 \fi
201 \def\newluachunkname#1{%
202   \e@alloc@luachunk\e@alloc@chardef
203   \e@alloc@luachunk@count\m@ne\e@alloc@top#1%
204   {\escapechar\m@ne
205    \directlua{lua.name[\the\allocationnumber]="\string#1"}}%
206 }
```

(End definition for \newluachunkname.)

5.9 Lua loader

Lua code loaded in the format often has to be loaded again at the beginning of every job, so we define a helper which allows us to avoid duplicated code:

```
207 \def\now@and@everyjob#1{%
208   \everyjob\expandafter{\the\everyjob
209     #1%
```

```

210 }%
211 #1%
212 }

```

Load the Lua code at the start of every job. For the conversion of T_EX into numbers at the Lua side we need some known registers: for convenience we use a set of systematic names, which means using a group around the Lua loader.

```

213 <2ekernel>\now@and@everyjob{%
214   \begingroup
215     \attributedef\attributezero=0 %
216     \chardef      \charzero      =0 %

```

Note name change required on older luatex, for hash table access.

```

217     \countdef      \CountZero    =0 %
218     \dimendef      \dimenzero    =0 %
219     \mathchardef    \mathcharzero=0 %
220     \muskipdef      \muskipzero   =0 %
221     \skipdef        \skipzero     =0 %
222     \toksdef        \tokszero     =0 %
223     \directlua{require("ltnatex")}
224   \endgroup
225 <2ekernel>}

```

5.10 Lua module preliminaries

```

279 <*lua>

```

Some set up for the Lua module which is needed for all of the Lua functionality added here.

luatexbase Set up the table for the returned functions. This is used to expose all of the public functions.

```

280 luatexbase      = luatexbase or { }
281 local luatexbase = luatexbase

```

(End definition for luatexbase.)

Some Lua best practice: use local versions of functions where possible.

```

282 local string_gsub      = string.gsub
283 local tex_count        = tex.count
284 local tex_setattribute = tex.setattribute
285 local tex_setcount     = tex.setcount
286 local texio_write_nl   = texio.write_nl

287 local luatexbase_warning
288 local luatexbase_error

```

5.11 Lua module utilities

5.11.1 Module tracking

modules To allow tracking of module usage, a structure is provided to store information and to return it.

```

289 local modules = modules or { }

```

(End definition for modules.)

`provides_module` Local function to write to the log.

```
290 local function luatexbase_log(text)
291     texio_write_nl("log", text)
292 end
```

Modelled on `\ProvidesPackage`, we store much the same information but with a little more structure.

```
293 local function provides_module(info)
294     if not (info and info.name) then
295         luatexbase_error("Missing module name for provides_module")
296     end
297     local function spaced(text)
298         return text and (" " .. text) or ""
299     end
300     luatexbase_log(
301         "Lua module: " .. info.name
302         .. spaced(info.date)
303         .. spaced(info.version)
304         .. spaced(info.description)
305     )
306     modules[info.name] = info
307 end
308 luatexbase.provides_module = provides_module
```

(End definition for provides_module.)

5.11.2 Module messages

There are various warnings and errors that need to be given. For warnings we can get exactly the same formatting as from \TeX . For errors we have to make some changes. Here we give the text of the error in the \LaTeX format then force an error from Lua to halt the run. Splitting the message text is done using `\n` which takes the place of `\MessageBreak`.

First an auxiliary for the formatting: this measures up the message leader so we always get the correct indent.

```
309 local function msg_format(mod, msg_type, text)
310     local leader = ""
311     local cont
312     local first_head
313     if mod == "LaTeX" then
314         cont = string_gsub(leader, ".", " ")
315         first_head = leader .. "LaTeX: "
316     else
317         first_head = leader .. "Module " .. msg_type
318         cont = "(" .. mod .. ")"
319         .. string_gsub(first_head, ".", " ")
320         first_head = leader .. "Module " .. mod .. " " .. msg_type .. ":"
321     end
322     if msg_type == "Error" then
323         first_head = "\n" .. first_head
324     end
325     if string.sub(text,-1) ~= "\n" then
```

```

326     text = text .. " "
327 end
328 return first_head .. " "
329 .. string_gsub(
330     text
331 .. "on input line "
332     .. tex.inputlineno, "\n", "\n" .. cont .. " "
333 )
334 .. "\n"
335 end

module_info Write messages.
module_warning
module_error
336 local function module_info(mod, text)
337     texio_write_nl("log", msg_format(mod, "Info", text))
338 end
339 luatexbase.module_info = module_info
340 local function module_warning(mod, text)
341     texio_write_nl("term and log", msg_format(mod, "Warning", text))
342 end
343 luatexbase.module_warning = module_warning
344 local function module_error(mod, text)
345     error(msg_format(mod, "Error", text))
346 end
347 luatexbase.module_error = module_error

(End definition for module_info, module_warning, and module_error.)

Dedicated versions for the rest of the code here.

348 function luatexbase_warning(text)
349     module_warning("luatexbase", text)
350 end
351 function luatexbase_error(text)
352     module_error("luatexbase", text)
353 end

```

5.12 Accessing register numbers from Lua

Collect up the data from the T_EX level into a Lua table: from version 0.80, LuaT_EX makes that easy.

```

354 local luaregisterbasetable = { }
355 local registermap = {
356     attributezero = "assign_attr"    ,
357     charzero      = "char_given"    ,
358     CountZero     = "assign_int"    ,
359     dimenzero     = "assign_dimen"  ,
360     mathcharzero  = "math_given"    ,
361     muskipzero    = "assign_mu_skip",
362     skipzero      = "assign_skip"   ,
363     tokszero      = "assign_toks"   ,
364 }
365 local createtoken
366 if tex.luatexversion > 81 then
367     createtoken = token.create
368 elseif tex.luatexversion > 79 then

```

```

369   createtoken = newtoken.create
370 end
371 local hashtokens = tex.hashtokens()
372 local luatexversion = tex.luatexversion
373 for i,j in pairs (registermap) do
374   if luatexversion < 80 then
375     luaregisterbasetable[hashtokens[i][1]] =
376       hashtokens[i][2]
377   else
378     luaregisterbasetable[j] = createtoken(i).mode
379   end
380 end

```

registernumber Working out the correct return value can be done in two ways. For older LuaTeX releases it has to be extracted from the `hashtokens`. On the other hand, newer LuaTeX's have `newtoken`, and whilst `.mode` isn't currently documented, Hans Hagen pointed to this approach so we should be OK.

```

381 local registernumber
382 if luatexversion < 80 then
383   function registernumber(name)
384     local nt = hashtokens[name]
385     if (nt and luaregisterbasetable[nt[1]]) then
386       return nt[2] - luaregisterbasetable[nt[1]]
387     else
388       return false
389     end
390   end
391 else
392   function registernumber(name)
393     local nt = createtoken(name)
394     if (luaregisterbasetable[nt.cmdname]) then
395       return nt.mode - luaregisterbasetable[nt.cmdname]
396     else
397       return false
398     end
399   end
400 end
401 luatexbase.registernumber = registernumber

```

(End definition for registernumber.)

5.13 Attribute allocation

new_attribute As attributes are used for Lua manipulations its useful to be able to assign from this end.

```

402 local attributes=setmetatable(
403   {},
404   {
405     __index = function(t,key)
406       return registernumber(key) or nil
407     end}
408 )
409 luatexbase.attributes = attributes

```

```

410 local attribute_count_name =
411         attribute_count_name or "e@alloc@attribute@count"
412 local function new_attribute(name)
413     tex_setcount("global", attribute_count_name,
414                 tex_count[attribute_count_name] + 1)
415     if tex_count[attribute_count_name] > 65534 then
416         luatexbase_error("No room for a new \\attribute")
417     end
418     attributes[name]= tex_count[attribute_count_name]
419     luatexbase_log("Lua-only attribute " .. name .. " = " ..
420                 tex_count[attribute_count_name])
421     return tex_count[attribute_count_name]
422 end
423 luatexbase.new_attribute = new_attribute

```

(End definition for new_attribute.)

5.14 Custom whatsit allocation

new_whatsit Much the same as for attribute allocation in Lua.

```

424 local whatsit_count_name = whatsit_count_name or "e@alloc@whatsit@count"
425 local function new_whatsit(name)
426     tex_setcount("global", whatsit_count_name,
427                 tex_count[whatsit_count_name] + 1)
428     if tex_count[whatsit_count_name] > 65534 then
429         luatexbase_error("No room for a new custom whatsit")
430     end
431     luatexbase_log("Custom whatsit " .. (name or "") .. " = " ..
432                 tex_count[whatsit_count_name])
433     return tex_count[whatsit_count_name]
434 end
435 luatexbase.new_whatsit = new_whatsit

```

(End definition for new_whatsit.)

5.15 Bytecode register allocation

new_bytecode Much the same as for attribute allocation in Lua. The optional $\langle name \rangle$ argument is used in the log if given.

```

436 local bytecode_count_name =
437         bytecode_count_name or "e@alloc@bytecode@count"
438 local function new_bytecode(name)
439     tex_setcount("global", bytecode_count_name,
440                 tex_count[bytecode_count_name] + 1)
441     if tex_count[bytecode_count_name] > 65534 then
442         luatexbase_error("No room for a new bytecode register")
443     end
444     luatexbase_log("Lua bytecode " .. (name or "") .. " = " ..
445                 tex_count[bytecode_count_name])
446     return tex_count[bytecode_count_name]
447 end
448 luatexbase.new_bytecode = new_bytecode

```

(End definition for new_bytecode.)

5.16 Lua chunk name allocation

`new_chunkname` As for bytecode registers but also store the name in the `lua.name` table.

```
449 local chunkname_count_name =
450     chunkname_count_name or "e@alloc@luachunk@count"
451 local function new_chunkname(name)
452     tex_setcount("global", chunkname_count_name,
453         tex_count[chunkname_count_name] + 1)
454     local chunkname_count = tex_count[chunkname_count_name]
455     chunkname_count = chunkname_count + 1
456     if chunkname_count > 65534 then
457         luatexbase_error("No room for a new chunkname")
458     end
459     lua.name[chunkname_count]=name
460     luatexbase_log("Lua chunkname " .. (name or "") .. " = " ..
461         chunkname_count .. "\n")
462     return chunkname_count
463 end
464 luatexbase.new_chunkname = new_chunkname
```

(End definition for new_chunkname.)

5.17 Lua function allocation

`new_luafunction` Much the same as for attribute allocation in Lua. The optional $\langle name \rangle$ argument is used in the log if given.

```
465 local luafunction_count_name =
466     luafunction_count_name or "e@alloc@luafunction@count"
467 local function new_luafunction(name)
468     tex_setcount("global", luafunction_count_name,
469         tex_count[luafunction_count_name] + 1)
470     if tex_count[luafunction_count_name] > 65534 then
471         luatexbase_error("No room for a new luafunction register")
472     end
473     luatexbase_log("Lua function " .. (name or "") .. " = " ..
474         tex_count[luafunction_count_name])
475     return tex_count[luafunction_count_name]
476 end
477 luatexbase.new_luafunction = new_luafunction
```

(End definition for new_luafunction.)

5.18 Lua callback management

The native mechanism for callbacks in LuaTeX allows only one per function. That is extremely restrictive and so a mechanism is needed to add and remove callbacks from the appropriate hooks.

5.18.1 Housekeeping

The main table: keys are callback names, and values are the associated lists of functions. More precisely, the entries in the list are tables holding the actual function as `func` and

the identifying description as `description`. Only callbacks with a non-empty list of functions have an entry in this list.

```
478 local callbacklist = callbacklist or { }
```

Numerical codes for callback types, and name-to-value association (the table keys are strings, the values are numbers).

```
479 local list, data, exclusive, simple, reverselist = 1, 2, 3, 4, 5
480 local types = {
481   list      = list,
482   data      = data,
483   exclusive = exclusive,
484   simple    = simple,
485   reverselist = reverselist,
486 }
```

Now, list all predefined callbacks with their current type, based on the LuaTeX manual version 1.01. A full list of the currently-available callbacks can be obtained using

```
\directlua{
  for i,_ in pairs(callback.list()) do
    texio.write_nl("- " .. i)
  end
}
\bye
```

in plain LuaTeX. (Some undocumented callbacks are omitted as they are to be removed.)

```
487 local callbacktypes = callbacktypes or {
```

Section 8.2: file discovery callbacks.

```
488   find_read_file      = exclusive,
489   find_write_file     = exclusive,

563 }
564 luatexbase.callbacktypes=callbacktypes
```

callback.register Save the original function for registering callbacks and prevent the original being used. The original is saved in a place that remains available so other more sophisticated code can override the approach taken by the kernel if desired.

```
565 local callback_register = callback_register or callback.register
566 function callback.register()
567   luatexbase_error("Attempt to use callback.register() directly\n")
568 end
```

(End definition for *callback.register*.)

5.18.2 Handlers

The handler function is registered into the callback when the first function is added to this callback's list. Then, when the callback is called, the handler takes care of running all functions in the list. When the last function is removed from the callback's list, the handler is unregistered.

More precisely, the functions below are used to generate a specialized function (closure) for a given callback, which is the actual handler.

The way the functions are combined together depends on the type of the callback. There are currently 4 types of callback, depending on the calling convention of the functions the callback can hold:

simple is for functions that don't return anything: they are called in order, all with the same argument;

data is for functions receiving a piece of data of any type except node list head (and possibly other arguments) and returning it (possibly modified): the functions are called in order, and each is passed the return value of the previous (and the other arguments untouched, if any). The return value is that of the last function;

list is a specialized variant of *data* for functions filtering node lists. Such functions may return either the head of a modified node list, or the boolean values **true** or **false**. The functions are chained the same way as for *data* except that for the following. If one function returns **false**, then **false** is immediately returned and the following functions are *not* called. If one function returns **true**, then the same head is passed to the next function. If all functions return **true**, then **true** is returned, otherwise the return value of the last function not returning **true** is used.

reverselist is a specialized variant of *list* which executes functions in inverse order.

exclusive is for functions with more complex signatures; functions in this type of callback are *not* combined: An error is raised if a second callback is registered..

Handler for data callbacks.

```
569 local function data_handler(name)
570   return function(data, ...)
571     for _,i in ipairs(callbacklist[name]) do
572       data = i.func(data,...)
573     end
574     return data
575   end
576 end
```

Default for user-defined data callbacks without explicit default.

```
577 local function data_handler_default(value)
578   return value
579 end
```

Handler for exclusive callbacks. We can assume `callbacklist[name]` is not empty: otherwise, the function wouldn't be registered in the callback any more.

```
580 local function exclusive_handler(name)
581   return function(...)
582     return callbacklist[name][1].func(...)
583   end
584 end
```

Handler for list callbacks.

```
585 local function list_handler(name)
586   return function(head, ...)
587     local ret
588     local alltrue = true
589     for _,i in ipairs(callbacklist[name]) do
590       ret = i.func(head, ...)
591       if ret == false then
592         luatexbase_warning(
593           "Function '" .. i.description .. "' returned false\n"
594           .. "in callback '" .. name .. "'")
595       end
596       return false
597     end
598     if ret ~= true then
599       alltrue = false
600       head = ret
601     end
602   end
603   return alltrue and true or head
604 end
605 end
```

Default for user-defined list and reverselist callbacks without explicit default.

```
606 local function list_handler_default()
607   return true
608 end
```

Handler for reverselist callbacks.

```
609 local function reverselist_handler(name)
610   return function(head, ...)
611     local ret
612     local alltrue = true
```

```

613     local callbacks = callbacklist[name]
614     for i = #callbacks, 1, -1 do
615         local cb = callbacks[i]
616         ret = cb.func(head, ...)
617         if ret == false then
618             luatexbase_warning(
619                 "Function '" .. cb.description .. "' returned false\n"
620                 .. "in callback '" .. name .. "'")
621         )
622         return false
623     end
624     if ret ~= true then
625         alltrue = false
626         head = ret
627     end
628 end
629 return alltrue and true or head
630 end
631 end

```

Handler for simple callbacks.

```

632 local function simple_handler(name)
633     return function(...)
634         for _,i in ipairs(callbacklist[name]) do
635             i.func(...)
636         end
637     end
638 end

```

Default for user-defined simple callbacks without explicit default.

```

639 local function simple_handler_default()
640 end

```

Keep a handlers table for indexed access and a table with the corresponding default functions.

```

641 local handlers = {
642     [data] = data_handler,
643     [exclusive] = exclusive_handler,
644     [list] = list_handler,
645     [reverselist] = reverselist_handler,
646     [simple] = simple_handler,
647 }
648 local defaults = {
649     [data] = data_handler_default,
650     [exclusive] = nil,
651     [list] = list_handler_default,
652     [reverselist] = list_handler_default,
653     [simple] = simple_handler_default,
654 }

```

5.18.3 Public functions for callback management

Defining user callbacks perhaps should be in package code, but impacts on `add_to_callback`. If a default function is not required, it may be declared as `false`. First we need a list of user callbacks.

```

655 local user_callbacks_defaults = {
656   pre_mlist_to_hlist_filter = list_handler_default,
657   mlist_to_hlist = node.mlist_to_hlist,
658   post_mlist_to_hlist_filter = list_handler_default,
659 }

```

`create_callback` The allocator itself.

```

660 local function create_callback(name, ctype, default)
661   local ctype_id = types[ctype]
662   if not name or name == ""
663   or not ctype_id
664   then
665     luatexbase_error("Unable to create callback:\n" ..
666                       "valid callback name and type required")
667   end
668   if callbacktypes[name] then
669     luatexbase_error("Unable to create callback '" .. name ..
670                       "':\ncallback is already defined")
671   end
672   default = default or defaults[ctype_id]
673   if not default then
674     luatexbase_error("Unable to create callback '" .. name ..
675                       "':\ndefault is required for '" .. ctype ..
676                       "': callbacks")
677   elseif type(default) ~= "function" then
678     luatexbase_error("Unable to create callback '" .. name ..
679                       "':\ndefault is not a function")
680   end
681   user_callbacks_defaults[name] = default
682   callbacktypes[name] = ctype_id
683 end
684 luatexbase.create_callback = create_callback

```

(End definition for create_callback.)

`call_callback` Call a user defined callback. First check arguments.

```

685 local function call_callback(name,...)
686   if not name or name == "" then
687     luatexbase_error("Unable to create callback:\n" ..
688                       "valid callback name required")
689   end
690   if user_callbacks_defaults[name] == nil then
691     luatexbase_error("Unable to call callback '" .. name
692                       .. "':\nunknown or empty")
693   end
694   local l = callbacklist[name]
695   local f
696   if not l then
697     f = user_callbacks_defaults[name]
698   else
699     f = handlers[callbacktypes[name]](name)
700   end
701   return f(...)
702 end
703 luatexbase.call_callback=call_callback

```

(End definition for call_callback.)

add_to_callback Add a function to a callback. First check arguments.

```
704 local function add_to_callback(name, func, description)
705   if not name or name == "" then
706     luatexbase_error("Unable to register callback:\n" ..
707                       "valid callback name required")
708   end
709   if not callbacktypes[name] or
710     type(func) ~= "function" or
711     not description or
712     description == "" then
713     luatexbase_error(
714       "Unable to register callback.\n\n"
715       .. "Correct usage:\n"
716       .. "add_to_callback(<callback>, <function>, <description>)"
717     )
718   end
```

Then test if this callback is already in use. If not, initialise its list and register the proper handler.

```
719   local l = callbacklist[name]
720   if l == nil then
721     l = { }
722     callbacklist[name] = l
```

If it is not a user defined callback use the primitive callback register.

```
723   if user_callbacks_defaults[name] == nil then
724     callback_register(name, handlers[callbacktypes[name]](name))
725   end
726 end
```

Actually register the function and give an error if more than one exclusive one is registered.

```
727   local f = {
728     func      = func,
729     description = description,
730   }
731   local priority = #l + 1
732   if callbacktypes[name] == exclusive then
733     if #l == 1 then
734       luatexbase_error(
735         "Cannot add second callback to exclusive function\n'" ..
736         name .. "'")
737     end
738   end
739   table.insert(l, priority, f)
```

Keep user informed.

```
740   luatexbase_log(
741     "Inserting '" .. description .. "' at position "
742     .. priority .. " in '" .. name .. "'."
743   )
744 end
745 luatexbase.add_to_callback = add_to_callback
```

(End definition for add_to_callback.)

remove_from_callback Remove a function from a callback. First check arguments.

```
746 local function remove_from_callback(name, description)
747   if not name or name == "" then
748     luatexbase_error("Unable to remove function from callback:\n" ..
749                       "valid callback name required")
750   end
751   if not callbacktypes[name] or
752     not description or
753     description == "" then
754     luatexbase_error(
755       "Unable to remove function from callback.\n\n"
756       .. "Correct usage:\n"
757       .. "remove_from_callback(<callback>, <description>)"
758     )
759   end
760   local l = callbacklist[name]
761   if not l then
762     luatexbase_error(
763       "No callback list for '" .. name .. "'\n")
764   end
```

Loop over the callback's function list until we find a matching entry. Remove it and check if the list is empty: if so, unregister the callback handler.

```
765   local index = false
766   for i,j in ipairs(l) do
767     if j.description == description then
768       index = i
769       break
770     end
771   end
772   if not index then
773     luatexbase_error(
774       "No callback '" .. description .. "' registered for '" ..
775       name .. "'\n")
776   end
777   local cb = l[index]
778   table.remove(l, index)
779   luatexbase_log(
780     "Removing '" .. description .. "' from '" .. name .. "'."
781   )
782   if #l == 0 then
783     callbacklist[name] = nil
784     if user_callbacks_defaults[name] == nil then
785       callback_register(name, nil)
786     end
787   end
788   return cb.func,cb.description
789 end
790 luatexbase.remove_from_callback = remove_from_callback
```

(End definition for remove_from_callback.)

in_callback Look for a function description in a callback.

```
791 local function in_callback(name, description)
792   if not name
793     or name == ""
794     or not callbacklist[name]
795     or not callbacktypes[name]
796     or not description then
797     return false
798   end
799   for _, i in pairs(callbacklist[name]) do
800     if i.description == description then
801       return true
802     end
803   end
804   return false
805 end
806 luatexbase.in_callback = in_callback
```

(End definition for in_callback.)

disable_callback As we subvert the engine interface we need to provide a way to access this functionality.

```
807 local function disable_callback(name)
808   if(callbacklist[name] == nil) then
809     callback_register(name, false)
810   else
811     luatexbase_error("Callback list for " .. name .. " not empty")
812   end
813 end
814 luatexbase.disable_callback = disable_callback
```

(End definition for disable_callback.)

callback_descriptions List the descriptions of functions registered for the given callback.

```
815 local function callback_descriptions (name)
816   local d = {}
817   if not name
818     or name == ""
819     or not callbacklist[name]
820     or not callbacktypes[name]
821   then
822     return d
823   else
824     for k, i in pairs(callbacklist[name]) do
825       d[k] = i.description
826     end
827   end
828   return d
829 end
830 luatexbase.callback_descriptions = callback_descriptions
```

(End definition for callback_descriptions.)

uninstall Unlike at the \TeX level, we have to provide a back-out mechanism here at the same time as the rest of the code. This is not meant for use by anything other than `latexrelease`: as such this is *deliberately* not documented for users!

```

831 local function uninstall()
832   module_info(
833     "luatexbase",
834     "Uninstalling kernel luatexbase code"
835   )
836   callback.register = callback_register
837   luatexbase = nil
838 end
839 luatexbase.uninstall = uninstall

```

(End definition for uninstall.)

mlist_to_hlist To emulate these callbacks, the “real” `mlist_to_hlist` is replaced by a wrapper calling the wrappers before and after.

```

840 callback_register("mlist_to_hlist", function(head, display_type, need_penalties)
841   local current = call_callback("pre_mlist_to_hlist_filter", head, display_type, need_penalties)
842   if current == false then
843     flush_list(head)
844     return nil
845   elseif current == true then
846     current = head
847   end
848   current = call_callback("mlist_to_hlist", current, display_type, need_penalties)
849   local post = call_callback("post_mlist_to_hlist_filter", current, display_type, need_penalties)
850   if post == true then
851     return current
852   elseif post == false then
853     flush_list(current)
854     return nil
855   end
856   return post
857 end)

```

(End definition for mlist_to_hlist.)

```

858 </lua>

```

Reset the catcode of `@`.

```

859 <tex>\catcode'\@=\etacatcode\relax

```

1.2 Using expl3 code

In order to ease the implementation of some new features in L^AT_EX 2_ε we may (temporarily) use some coding based on the expl3-code. Such macros will eventually vanish and may be changed unannounced. They are there for internal use in the L^AT_EX 2_ε kernel and are not meant to be used in third-party packages. These macros will always have the @expl@ prefix in their name.

The rest of the name matches the expl3 name but with all underscores replaced by @s and the : replaced by @@, e.g.,

```
\cs_new_eq:NN \@expl@tl@trim@spaces@apply@@nN \tl_trim_spaces_apply:nN
```

if that expl3 command is needed in places that are others coded in L^AT_EX 2_ε conventions.

In this file, each release of LaTeX adds an \IncludeInRelease block, in which the macros copied for that release were defined. In case a rollback is requested, the entire block is changed.

Each macro copied has a \changes entry to explain when and why it was copied, so that further to that may spot it easily.

Here \cs_gset_eq:NN is used, instead of the new variant because if different releases use that same name for different purposes, each can copy the macro without worrying about redefinitions.

```

126 <latexrelease>\IncludeInRelease{2020/10/01}{\@expl@cs@to@str@@N}%
127 <latexrelease>      {expl3 macros added for the 2020-10-01 release}%

```

The expl3 activation needs to be inside the release guards as otherwise rolling forward is broken in old kernels that do not have expl3 loaded.

```

128 \ExplSyntaxOn

129 \cs_gset_eq:NN \@expl@cs@to@str@@N \cs_to_str:N
130 \cs_gset_eq:NN \@expl@str@if@eq@@nnTF \str_if_eq:nnTF

1 Definitions

This section contains commands used in defining other macros.

```
1 <*2ekernel>
```

1.1 Initex initializations

`\two@digits` Prefix a number less than 10 with ‘0’.

```
2 \def\two@digits#1{\ifnum#1<10 0\fi\number#1}
```

(End definition for \two@digits.)

`\typeout` Display something on the terminal.

```
3 </2ekernel>
4 <*2ekernel | latexrelease>
5 <latexrelease> \IncludeInRelease{2020/10/01}%
6 <latexrelease>           {\typeout}{Allow "par" in \typeout}%
7 \protected\long\def\typeout#1{\begingroup
8   \set@display@protect
9   \def\par{^^J^^J}%
10  \immediate\write\@unused{#1}\endgroup}
11 </2ekernel | latexrelease>
12 <latexrelease> \EndIncludeInRelease
13 <latexrelease> \IncludeInRelease{0000/00/00}%
14 <latexrelease>           {\typeout}{Allow "par" in \typeout}%
15 <latexrelease>
16 <latexrelease> \def\typeout#1{\begingroup\set@display@protect
17 <latexrelease>   \immediate\write\@unused{#1}\endgroup}
18 <latexrelease> \EndIncludeInRelease
19 <*2ekernel>
```

(End definition for \typeout.)

`\newlinechar` A char to be used as new-line in output to files.

```
20 \newlinechar‘^^J
```

(End definition for \newlinechar.)

1.2 Saved versions of TeX primitives

The TeX primitive `\foo` is saved as `\@@foo`. The following primitives are handled in this way:

`\@@par`

```
21 \let\@@par=\par
22 %\let\@@input=\input      %%% moved earlier
23 %\let\@@end=\end          %%%
```

(End definition for \@@par.)

`\@@hyph` Save original primitive definition.

```

24 \let\@@hyph=\-

```

(End definition for `\@@hyph`.)

`\@@italiccorr` Save the original italic correction.

```

25 \let\@@italiccorr=\/

```

(End definition for `\@@italiccorr`.)

`\@height` The following definitions save token space. E.g., using `\@height` instead of `height` saves

`\@depth` 5 tokens at the cost in time of one macro expansion.

```

26 \def\@height{height} \def\@depth{depth} \def\@width{width}
27 \def\@minus{minus}
28 \def\@plus{plus}

```

The next one is another 100 tokens worth.

```

29 \def\hb@xt@{\hbox to}

```

(End definition for `\@height` and others.)

```

30 \message{hacks,}

```

`\hb@xt@`

1.3 Command definitions

This section defines the following commands:

`\@namedef` `{\NAME}`
Expands to `\def\{\NAME}`, except name can contain any characters.

`\@nameuse` `{\NAME}`
Expands to `\{\NAME}`.

`\@ifnextchar` `X{\YES}\{NO}`
Expands to `\YES` if next character is an ‘X’, and to `\NO` otherwise. (Uses `\reserved@a–\reserved@c`.) NOTE: GOBBLES ANY SPACE FOLLOWING IT.

`\@ifstar` `{\YES}\{NO}`
Gobbles following spaces and then tests if next the character is a ‘*’. If it is, then it gobbles the ‘*’ and expands to `\YES`, otherwise it expands to `\NO`.

`\@dblarg` `{\CMD}\{ARG}`
Expands to `\{\CMD}\[ARG]\{ARG}`. Use `\@dblarg\CS` when `\CS` takes arguments `[ARG1]{ARG2}`, where default is `ARG1 = ARG2`.

`\@ifundefined` `{\NAME}\{YES}\{NO}`
: If `\NAME` is undefined then it executes `\YES`, otherwise it executes `\NO`. More precisely, true if `\NAME` either undefined or = `\relax`.

`\@ifdefinable` `\NAME{\YES}` Executes `\YES` if the user is allowed to define `\NAME`, otherwise it gives an error. The user can define `\NAME` if `\@ifundefined{NAME}` is true, ‘NAME’ ≠ ‘relax’ and the first three letters of ‘NAME’ are not ‘end’, and if `\endNAME` is not defined.

`\newcommand` `*{\F00}[\i]{TEXT}`
User command to define `\F00` to be a macro with `i` arguments (`i = 0` if missing) having the definition `\TEXT`. Produces an error if `\F00` already defined.

Normally the command is defined to be `\long` (ie it may take multiple paragraphs in its argument). In the star-form, the command is not defined as `\long` and a blank line in any argument to the command would generate an error.

`\renewcommand` `*{\F00}[\i]{TEXT}`

Same as `\newcommand`, except it checks if `\F00` already defined.

`\newenvironment` $\star{\langle FOO\rangle}[\langle i\rangle]{\langle DEF1\rangle}{\langle DEF2\rangle}$
equivalent to:
`\newcommand{\F00}[i]{DEF1} \def{\endF00}{DEF2}`
(or the appropriate star forms).

`\renewenvironment` Obvious companion to `\newenvironment`.

`\@cons` : See description of `\output` routine.

`\@car` `\@car T1 T2 ... Tn\@nil == T1` (unexpanded)

`\@cdr` `\@cdr T1 T2 ... Tn\@nil == T2 ... Tn` (unexpanded)

`\typeout` $\{\langle message\rangle\}$
Produces a warning message on the terminal.

`\typein` $\{\langle message\rangle\}$
Types message, asks the user to type in a command, then executes it

`\typein` $[\langle\backslash CS\rangle]{\langle MSG\rangle}$
Same as above, except defines `\CS` to be the input instead of executing it.

`\typein`

```

31 \def\typein{%
32   \let\@typein\relax
33   \@testopt\@xtypein\@typein}

34 \ifx\directlua\@undefined

35 \def\@xtypein[#1]#2{%
36   \typeout{#2}%
37   \advance\endlinechar\@M
38   \read\@inputcheck to#1%
39   \advance\endlinechar-\@M
40   \@typein}%

41 \else

42 \def\@xtypein[#1]#2{%
43   \typeout{#2}%
44   \begingroup \endlinechar\m@ne
45   \read\@inputcheck to#1%
46   \expandafter\endgroup
47   \expandafter\def\expandafter#1\expandafter{#1}%
48   \@typein}%

49 \fi

```

(End definition for `\typein`.)

`\@namedef`

```

50 \def\@namedef#1{\expandafter\def\csname #1\endcsname}

```

(End definition for `\@namedef`.)

`\@nameuse`

```

51 \def\@nameuse#1{\csname #1\endcsname}

```

(End definition for `\@nameuse`.)

```

\@cons
52 \def\@cons#1#2{\begingroup\let\@elt\relax\xdef#1{#1\@elt #2}\endgroup}

(End definition for \@cons.)

\@car
\@cdr
53 \def\@car#1#2\@nil{#1}
54 \def\@cdr#1#2\@nil{#2}

(End definition for \@car and \@cdr.)

\@carcube \@carcube T1 ... Tn\@nil = T1 T2 T3 , n > 3
55 \</2ekernel>
56 \<latexrelease>\IncludeInRelease{2020/10/01}{\@carcube}{Make \@carcube long}%

61 %
62 \<latexrelease>\IncludeInRelease{0000/00/00}{\@carcube}{Undo: Make \@carcube long}%
63 \<latexrelease>\def\@carcube#1#2#3#4\@nil{#1#2#3}
64 \<latexrelease>\EndIncludeInRelease
65 \<*2ekernel>

(End definition for \@carcube.)

\@onlypreamble This macro adds its argument to the list of commands stored in \@preamblecmds
\@preamblecmds to be disabled after \begin{document}. These commands are redefined to generate
\@notprerr at this point.
66 \def\@preamblecmds{}
67 \def\@onlypreamble#1{%
68   \expandafter\gdef\expandafter\@preamblecmds\expandafter{%
69     \@preamblecmds\do#1}}
70 \@onlypreamble\@onlypreamble
71 \@onlypreamble\@preamblecmds

(End definition for \@onlypreamble and \@preamblecmds.)

\@star@or@long Look ahead for a *. If present reset \l@ngrel@x so that the next definition, #1, will be
non-long.
72 \def\@star@or@long#1{%
73   \ifstar
74     {\let\l@ngrel@x\relax#1}%
75     {\let\l@ngrel@x\long#1}}

(End definition for \@star@or@long.)

\l@ngrel@x This is either \relax or \long depending on whether the *-form of a definition command
is being executed.
76 \let\l@ngrel@x\relax

(End definition for \l@ngrel@x.)

\newcommand User level \newcommand.
77 \def\newcommand{\@star@or@long\new@command}

```

```

\newcommand 78 \def\newcommand#1{%
79 \testopt{\@newcommand#1}0}

(End definition for \newcommand and \@newcommand.)

```

```

\@newcommand Handling arguments for \newcommand.
\@argdef 80 \def\@newcommand#1[#2]{%
\@xargdef 81 \kernel@ifnextchar [{\@xargdef#1[#2]}%
82 {\@argdef#1[#2]}}

```

Define #1 if it is definable.

Both here and in \@xargdef the replacement text is absorbed as an argument because if we are not allowed to make the definition we have to get rid of it completely.

```

83 \long\def\@argdef#1[#2]#3{%
84 \ifdefinable #1{\@yargdef#1\@ne{#2}{#3}}

```

Handle the second optional argument.

```

85 \long\def\@xargdef#1[#2] [#3]#4{%
86 \ifdefinable#1{%

```

Define the actual command to be:

```

\def\foo{\@protected@testopt\foo\\foo{default}}

```

where \\foo is a csname generated from applying \csname and \string to \foo, ie the actual name contains a backslash and therefore can't clash easily with existing command names. "Default" is the contents of the second optional argument of (re)newcommand.

```

87 \expandafter\def\expandafter#1\expandafter{%
88 \expandafter
89 \@protected@testopt
90 \expandafter
91 #1%
92 \csname\string#1\endcsname
93 {#3}}%

```

Now we define the internal macro ie \\foo which is supposed to pick up all arguments (optional and mandatory).

```

94 \expandafter\@yargdef
95 \csname\string#1\endcsname
96 \tw@
97 {#2}%
98 {#4}}

```

(End definition for \@newcommand, \@argdef, and \@xargdef.)

\@testopt This macro encapsulates the most common call to \@ifnextchar, saving several tokens each time it is used in the definition of a command with an optional argument. #1 The code to execute in the case that there is a [need not be a single token but can be any sequence of commands that 'expects' to be followed by [. If this command were only used in \newcommand definitions then #1 would be a single token and the braces could be omitted from {#1} in the definition below, saving a bit of memory.

```

99 \long\def\@testopt#1#2{%
100 \kernel@ifnextchar[{#1}{#1[{#2}]]}

```

(End definition for \@testopt.)

`\@protected@testopt` Robust version of `\@testopt`. The extra argument (`#1`) must be a single token. If protection is needed the call expands to `\protect` applied to this token, and the 2nd and 3rd arguments are discarded (by `\@x@protect`). Otherwise `\@testopt` is called on the 2nd and 3rd arguments.

This method of making commands robust avoids the need for using up two csnames per command, the price is the extra expansion time for the `\ifx` test.

```

101 \def\@protected@testopt#1{%
102   \ifx\protect\@typeset@protect
103     \expandafter\@testopt
104   \else
105     \@x@protect#1%
106   \fi}

```

(End definition for `\@protected@testopt`.)

`\@yargdef` These generate a primitive argument specification, from a L^AT_EX [*digit*] form; in fact `\@yargd@f` *digit* can be anything such that `\number <digit>` is single digit.

Reorganised slightly so that `\renewcommand{\reserved@a}[1]{foo}` works. I am not sure this is worth it, as a following `\newcommand` would over-write the definition of `\reserved@a`.

Recall that L^AT_EX 2.09 goes into an infinite loop with `\renewcommand[1]{\@tempa}{foo}` (DPC 6 October 93).

Reorganised again (DPC 1999). Rather than make a loop to construct the argument spec by counting, just extract the required argument spec by using a delimited argument (delimited by the digit). This is faster and uses less tokens. The coding is slightly odd to preserve the old interface (using `#2 = \tw@` as the flag to surround the first argument with []). But the new method did not allow for the number of arguments `#3` not being given as an explicit digit; hence (further expansion of this argument and use of) `\number` was added later in 1999.

It is not clear why these are still `\long`.

```

107 \long \def \@yargdef #1#2#3{%
108   \ifx#2\tw@
109     \def\reserved@b##1{####1}%
110   \else
111     \let\reserved@b\@gobble
112   \fi
113   \expandafter
114     \@yargd@f \expandafter{\number #3}#1%
115 }

116 \long \def \@yargd@f#1#2{%
117   \def \reserved@a ##1#1#2##{%
118     \expandafter\def\expandafter#2\reserved@b ##1#1%
119   }%
120   \l@ngrel@x \reserved@a 0##1##2##3##4##5##6##7##8##9###1%
121 }

```

(End definition for `\@yargdef` and `\@yargd@f`.)

`\@reargdef`

```

122 \long\def\@reargdef#1[#2]{%
123   \@yargdef#1\@ne{#2}}

```

(End definition for \@reargdef.)

\renewcommand Check the command name is already used. If not give an error message. Then temporarily disable \@ifdefinable then call \newcommand. (Previous version \let#1=\relax but this does not work too well if #1 is \@tempa-e.)

```
124 \def\renewcommand{\@star@or@long\renew@command}
```

```
\renew@command 125 \def\renew@command#1{%
126   \begingroup \escapechar\m@ne\xdef\@gtempa{\string#1}}\endgroup
127   \expandafter\ifundefined\@gtempa
128     {\@latex@error{Command \string#1 undefined}\@ehc}%
129     \relax
130   \let\@ifdefinable\@rc@ifdefinable
131   \new@command#1}
```

(End definition for \renewcommand and \renew@command.)

\@ifdefinable Test if user is allowed to define a command.

```
\@ifdefinable 132 \long\def\@ifdefinable #1#2{%
\@rc@ifdefinable 133   \edef\reserved@a{\expandafter\@gobble\string #1}%
134   \@ifundefined\reserved@a
135     {\edef\reserved@b{\expandafter\@carcube \reserved@a xxx\@nil}%
136     \ifx \reserved@b\@qend \@notdefinable\else
137     \ifx \reserved@a\@qrelax \@notdefinable\else
138     #2%
139     \fi
140     \fi}%
141   \@notdefinable}
```

Saved definition of \@ifdefinable.

```
142 \let\@@ifdefinable\@ifdefinable
```

Version of \@ifdefinable for use with \renewcommand. Does not do the check this time, but restores the normal definition.

```
143 \long\def\@rc@ifdefinable#1#2{%
144   \let\@ifdefinable\@@ifdefinable
145   #2}
```

(End definition for \@ifdefinable, \@@ifdefinable, and \@rc@ifdefinable.)

\newenvironment Define a new user environment. #1 is the environment name. #2# Grabs all the tokens up to the first {. These will be any optional arguments. They are not parsed at this point, but are just passed to \@newenv which will eventually call \newcommand. Any optional arguments will then be parsed by \newcommand as it defines the command that executes the 'begin code' of the environment.

This #2# trick removed with version 1.2i as it fails if a { occurs in the optional argument. Now use \@ifnextchar directly.

```
146 \def\newenvironment{\@star@or@long\new@environment}
```

```
\new@environment 147 \def\new@environment#1{%
148   \@testopt{\@newenva#1}0}
```

```

149 \def\@newenva#1[#2]{%
\@newenva 150 \kernel@ifnextchar [{\@newenvb#1[#2]}{\@newenv{#1}{[#2]}}}]

151 \def\@newenvb#1[#2][#3]{\@newenv{#1}{[#2][#3]}}
\@newenvb (End definition for \newenvironment and others.)

\renewenvironment Redefine an environment. For \renewenvironment disable \@ifdefinable and then call
\newenvironment. It is OK to \let the argument to \relax here as there should not
be a @temp... environment.
152 \def\renewenvironment{\@star@or@long\renew@environment}

\renew@environment 153 \def\renew@environment#1{%
154 \ifundefined{#1}%
155 {\@latex@error{Environment #1 undefined}\@ehc
156 }\relax
157 \expandafter\let\csname#1\endcsname\relax
158 \expandafter\let\csname end#1\endcsname\relax
159 \new@environment{#1}}
(End definition for \renewenvironment and \renew@environment.)

\@newenv The internal version of \newenvironment.
Call \newcommand to define the <begin-code> for the environment. \def is used for
the <end-code> as it does not take arguments. (but may contain \pars)
Make sure that an attempt to define a ‘graf’ or ‘group’ environment fails.
160 \long\def\@newenv#1#2#3#4{%
161 \ifundefined{#1}%
162 {\expandafter\let\csname#1\expandafter\endcsname
163 \csname end#1\endcsname}%
164 \relax
165 \expandafter\new@command
166 \csname #1\endcsname#2{#3}%
167 \l@ngrel@x\expandafter\def\csname end#1\endcsname{#4}}
(End definition for \@newenv.)

\newif And here’s a different sort of allocation: For example, \newif\iffoo creates \footrue,
\foofalse to go with \iffoo.
168 \def\newif#1{%
169 \count@\escapechar \escapechar\m@ne
170 \let#1\iffalse
171 \@if#1\iftrue
172 \@if#1\iffalse
173 \escapechar\count@}

\@if 174 \def\@if#1#2{%
175 \expandafter\def\csname\expandafter\@gobbletwo\string#1%
176 \expandafter\@gobbletwo\string#2\endcsname
177 {\let#1#2}}

```

(End definition for `\newif` and `\@if`.)

`\providecommand` `\providecommand` takes the same arguments as `\newcommand`, but discards them if #1 is already defined, Otherwise it just acts like `\newcommand`. This implementation currently leaves any discarded definition in `\reserved@a` (and possibly `\reserved@a`) this wastes a bit of space, but it will be reclaimed as soon as these scratch macros are redefined.

```
178 \def\providecommand{\@star@or@long\provide@command}
```

```
\provide@command 179 \def\provide@command#1{%
180   \begingroup
181     \escapechar\m@ne\xdef\@gtempa{\string#1}%
182   \endgroup
183   \expandafter\@ifundefined\@gtempa
184     {\def\reserved@a{\new@command#1}}%
185     {\def\reserved@a{\renew@command\reserved@a}}%
186   \reserved@a}%

```

(End definition for `\providecommand` and `\provide@command`.)

`\CheckCommand` `\CheckCommand` takes the same arguments as `\newcommand`. If the command already exists, with the same definition, then nothing happens, otherwise a warning is issued. Useful for checking the current state before a macro package starts redefining things. Currently two macros are considered to have the same definition if they are the same except for different default arguments. That is, if the old definition was: `\newcommand\xxx[2][a]{(#1)(#2)}` then `\CheckCommand\xxx[2][b]{(#1)(#2)}` would *not* generate a warning, but, for instance `\CheckCommand\xxx[2]{(#1)(#2)}` would.

```
187 \def\CheckCommand{\@star@or@long\check@command}
```

`\CheckCommand` is only available in the preamble part of the document.

```
188 \@onlypreamble\CheckCommand
```

```
\check@command 189 \def\check@command#1#2#{\@check@c#1{#2}}
190 \@onlypreamble\check@command
```

(End definition for `\CheckCommand` and `\check@command`.)

`\@check@c` `\CheckCommand` itself just grabs all the arguments we need, without actually looking for [optional argument forms. Now define `\reserved@a`. If `\reserved@a` is then defined, compare it with the “#1’ otherwise compare `\reserved@a` with #1.

```
191 \long\def\@check@c#1#2#3{%
192   \expandafter\let\csname\string\reserved@a\endcsname\relax
193   \renew@command\reserved@a#2{#3}%
194   \@ifundefined{\string\reserved@a}%
195     {\@check@eq#1\reserved@a}%
196     {\expandafter\@check@eq
197       \csname\string#1\expandafter\endcsname
198       \csname\string\reserved@a\endcsname}}
199 \@onlypreamble\@check@c

```

(End definition for `\@check@c`.)

```

\@check@eq Complain if #1 and #2 are not \ifx equal.
200 \def\@check@eq#1#2{%
201   \ifx#1#2\else
202     \@latex@warning@no@line
203       {Command \noexpand#1 has
204         changed.\MessageBreak
205         Check if current package is valid}%
206   \fi}
207 \onlypreamble\@check@eq

(End definition for \@check@eq.)

\@gobble The \@gobble macro is used to get rid of its argument.
\@gobbletwo 208 \long\def \@gobble #1{}
\@gobblethree 209 \long\def \@gobbletwo #1#2{}
\@gobblefour 210 \long\def \@gobblethree #1#2#3{}
211 \long\def \@gobblefour #1#2#3#4{}

(End definition for \@gobble and others.)

\@firstofone Some argument-grabbers.
\@firstoftwo 212 \long\def \@firstofone#1{#1}
\@secondoftwo 213 \long\def \@firstoftwo#1#2{#1}
214 \long\def \@secondoftwo#1#2{#2}

\@iden is another name for \@firstofone for compatibility reasons.
215 \let\@iden\@firstofone

\@iden (End definition for \@firstofone and others.)

\@thirdofthree Another grabber now used in the encoding specific section.
216 \long\def \@thirdofthree#1#2#3{#3}

(End definition for \@thirdofthree.)

\@expandtwoargs A macro to totally expand two arguments to another macro
217 \def\@expandtwoargs#1#2#3{%
218   \edef\reserved@a{\noexpand#1{#2}{#3}}\reserved@a}

(End definition for \@expandtwoargs.)

\@backslashchar A category code 12 backslash.
219 \edef\@backslashchar{\expandafter\@gobble\string\\}

(End definition for \@backslashchar.)

```

1.4 Robust commands and protect

Fragile and robust commands are one of the thornier issues in L^AT_EX's commands. Whilst typesetting documents, L^AT_EX makes use of many of T_EX's features, such as arithmetic, defining macros, and setting variables. However, there are (at least) three different occasions when these commands are not safe. These are called 'moving arguments' by L^AT_EX, and consist of:

- writing information to a file, such as indexes or tables of contents.
- writing information to the screen.
- inside an `\edef`, `\message`, `\mark`, or other command which evaluates its argument fully.

The method L^AT_EX uses for making fragile commands robust is to precede them with `\protect`. This can have one of four possible values:

- `\relax`, for normal typesetting. So `\protect\foo` will execute `\foo`.
- `\string`, for writing to the screen. So `\protect\foo` will write `\foo`.
- `\noexpand`, for writing to a file. So `\protect\foo` will write `\foo` followed by a space.
- `\@unexpandable@protect`, for writing a moving argument to a file. So `\protect\foo` will write `\protect\foo` followed by a space. This value is also used inside `\edefs`, `\marks` and other commands which evaluate their arguments fully. More precisely, whenever the content of an `\edef` or `\xdef` etc. can contain arbitrary user input not under the direct control of the programmer, one should use `\protected@edef` instead of `\edef`, etc., so that `\protect` has a suitable definition and the user input will not break if it contains fragile commands.

`\@unexpandable@protect`

```
220 \def\@unexpandable@protect{\noexpand\protect\noexpand}
```

(End definition for \@unexpandable@protect.)

`\DeclareRobustCommand`
`\declare@robustcommand`

This is a package-writers command, which has the same syntax as `\newcommand`, but which declares a protected command. It does this by having

```
\DeclareRobustCommand\foo
define \foo to be \protect\foo<space>,
and then use \newcommand\foo<space>.
```

Since the internal command is `\foo<space>`, when it is written to an auxiliary file, it will appear as `\foo`.

We have to be a bit cleverer if we're defining a short command, such as `_`, in order to make sure that the auxiliary file does not include a space after the command, since `_ a` and `_a` aren't the same. In this case we define `_` to be:

```
\x@protect\_ \protect\_<space>
```

which expands to:

```

\ifx\protect\@typeset@protect\else
  \@x@protect@\_
\fi
\protect\_<space>

```

Then if `\protect` is `\@typeset@protect` (normally `\relax`) then we just perform `_<space>`, and otherwise `\@x@protect@` gobbles everything up and expands to `\protect_<space>`.

Note: setting `\protect` to any value other than `\relax` whilst in ‘typesetting’ mode will cause commands to go into an infinite loop! In particular, setting `\protect` to `\@empty` will cause `_` to loop forever. It will also break lots of other things, such as protected `\ifmmodes` inside `\haligns`. If you really have to do such a thing, then please set `\@typeset@protect` to be `\@empty` as well. (This is what the code for `\patterns` does, for example.)

More fun with `\expandafter` and `\csname`.

```

221 \def\DeclareRobustCommand{\@star@or@long\declare@robustcommand}
222 \def\declare@robustcommand#1{%
223   \ifx#1\@undefined\else\ifx#1\relax\else
224     \@latex@info{Redefining \string#1}%
225   \fi\fi
226   \edef\reserved@a{\string#1}%
227   \def\reserved@b{#1}%
228   \edef\reserved@b{\expandafter\strip@prefix\meaning\reserved@b}%
229   \edef#1{%
230     \ifx\reserved@a\reserved@b
231       \noexpand\x@protect
232       \noexpand#1%
233     \fi
234     \noexpand\protect
235     \expandafter\noexpand\csname
236       \expandafter\@gobble\string#1 \endcsname
237   }%
238   \let\@ifdefinable\@rc@ifdefinable
239   \expandafter\new@command\csname
240     \expandafter\@gobble\string#1 \endcsname
241 }

```

(End definition for `\DeclareRobustCommand` and `\declare@robustcommand`.)

```

\@x@protect
\@x@protect
242 \def\x@protect#1{%
243   \ifx\protect\@typeset@protect\else
244     \@x@protect#1%
245   \fi
246 }
247 \def\@x@protect#1\fi#2#3{%
248   \fi\protect#1%
249 }

```

(End definition for `\@x@protect` and `\x@protect`.)

`\@typeset@protect` We set `\@typeset@protect` to `\relax` rather than `\@empty` to make sure that the protection mechanism stops the look-ahead and expansion performed at the start of `\halign` cells.

```

250 \let\@typeset@protect\relax

```

(End definition for \@typeset@protect.)

\set@display@protect These macros set \protect appropriately for typesetting or displaying.

```
\set@typeset@protect 251 \def\set@display@protect{\let\protect\string}
252 \def\set@typeset@protect{\let\protect\@typeset@protect}
```

(End definition for \set@display@protect and \set@typeset@protect.)

\protected@edef The commands \protected@edef and \protected@xdef perform ‘safe’ \edefs and

\protected@xdef \xdefs, saving and restoring \protect appropriately. For cases where restoring \protect

\unrestored@protected@xdef doesn’t matter, there’s an ‘unsafe’ \unrestored@protected@xdef, useful if you know what you’re doing!

```
\restore@protect 253 \def\protected@edef{%
254   \let\@@protect\protect
255   \let\protect\@unexpandable@protect
256   \afterassignment\restore@protect
257   \edef
258 }
259 \def\protected@xdef{%
260   \let\@@protect\protect
261   \let\protect\@unexpandable@protect
262   \afterassignment\restore@protect
263   \xdef
264 }
265 \def\unrestored@protected@xdef{%
266   \let\protect\@unexpandable@protect
267   \xdef
268 }
269 \def\restore@protect{\let\protect\@@protect}
```

(End definition for \protected@edef and others.)

\protect The normal meaning of \protect

```
270 \set@typeset@protect
```

(End definition for \protect.)

\MakeRobust This macro makes an existing fragile macro robust, but only if it hasn’t been robust in the past, i.e., it checks for the existence of the macro \<name>_ and if that exists it assumes that \<name> is already robust. In that case either undefine the inner macro first or use \DeclareRobustCommand to define it in a robust way directly. We could probably test the top-level definition to have the right kind of structure, but this is somewhat problematical as we then have to distinguish between \long macros and others and also take into account that sometimes the top-level is deliberately done manually (like with \begin).

The macro firstly checks if the control sequence in question exists at all.

```
271 \</2ekernel>
272 \<latexrelease>\IncludeInRelease{2020/10/01}{\MakeRobust}{\MakeRobust}%
273 \<*2ekernel | latexrelease>
274 \def\MakeRobust#1{%
275   \count@=\escapechar
276   \escapechar=‘\
277   \@ifundefined{expandafter@gobble\string#1}{%
278     \@latexerror{The control sequence ‘\string#1’ is undefined!%
```

```

279     \MessageBreak There is nothing here to make robust}}%
280     \@eha
281 }%

```

Then we check if the macro is already robust. We do this by testing if the internal name for a robust macro is defined, namely `\foo_`. If it is already defined do nothing, otherwise set `\foo_` equal to `\foo` and redefine `\foo` so that it acts like a macro defined with `\DeclareRobustCommand`. We use `\@kernel@rename@newcommand` to copy `\foo` over to `\foo_`, including a possible default optional argument.

```

282 {%
283   \@ifundefined{\expandafter\@gobble\string#1\space}%
284   {%
285     \expandafter\@kernel@rename@newcommand
286     \csname\expandafter\@gobble\string#1\space\endcsname
287     #1%
288     \edef\reserved@a{\string#1}%
289     \def\reserved@b{#1}%
290     \edef\reserved@b{\expandafter\strip@prefix\meaning\reserved@b}%
291     \xdef#1{%
292       \ifx\reserved@a\reserved@b
293         \noexpand\x@protect\noexpand#1%
294       \fi
295       \noexpand\protect\expandafter\noexpand
296       \csname\expandafter\@gobble\string#1\space\endcsname}%
297   }%
298   {\@latex@info{The control sequence ‘\string#1’ is already robust}}%
299 }%
300 \escapechar=\count@
301 }%

```

`\@kernel@rename@newcommand` This macro renames a command, possibly with an optional argument (defined with `\newcommand`) from #2 to #1, by renaming the internal macro `\\#2` to `\\#1` and defining `\#1` appropriately, then undefining `\#2` and `\\#2`. The `\afterassignment` trick is to make both definitions in `\@copy@newcommand` global (which are local by default).

In case the macro was defined with `\newcommand` and an optional argument, to replicate exactly the behaviour of `\DeclareRobustCommand` we have to move also the internal `\\foo` to `\\foo_`. In that case, #1 will be a parameterless macro (`\robust@command@chk@safe` checks that), and `\@if@newcommand` will return true (both defined below in this file). If so, we can use `\@copy@newcommand` rather than plain `\let` to copy the command over. `\@kernel@rename@newcommand` does this test and carries out the renaming.

```

302 \def\@kernel@rename@newcommand#1#2{%
303   \robust@command@chk@safe#2%
304   {\@if@newcommand#2%
305     {\afterassignment\global

`\kernel@make@fragile` The opposite of `\MakeRobust` except that it doesn't do many checks as it is internal to the kernel. Why does one want such a thing? Only for compatibility reasons if `latexrelease` requests a rollback of the kernel. For this reason we pretend that this command existed in all earlier versions of L^AT_EX i.e., we are not rolling it back since we need it precisely then. But we have to get it into the `latexrelease` file so that a roll forward is possible too.

```

1.5 Acting on robust commands

```

409 \if2ekernel
410 \latexrelease\IncludeInRelease{2020-10-01}\robust@command@act}
411 \latexrelease {Add \robust@command@act}%
412 \*2ekernel\latexrelease

```

With most document level commands being robust now there is more of a requirement to have a standard way of aliasing (or copying) a command to a new name, for example to save an original definition before changing a command. `\DeclareCommandCopy` is analogous to \TeX 's `\let`, except that it copes with the different types of robust commands defined by \LaTeX 's mechanisms.

A couple of “types of robustness” are defined by the \LaTeX 2_ϵ kernel, namely robust commands defined with `\DeclareRobustCommand` and commands with optional arguments defined with `\newcommand`. However there are other types of robust commands that are frequently used, which are not defined in the \LaTeX 2_ϵ kernel, like commands defined with `xparse`'s `\NewDocumentCommand` and `etoolbox`'s `\newrobustcmd`.

In this section we will define a generic extensible machinery to act on robust commands. This code will then be used to test if a command is robust, considered the different types of robustness, and then either copy that definition, if `\DeclareCommandCopy` (or similar) is used, or show the definition of the command, if `\ShowCommand` is used.

`\robust@command@act` The looping machinery is generic and knows nothing about what is to be done for each case. The syntax of the main macro `\robust@command@act` is:

```

\robust@command@act<action-list><robust-cmd>
<fallback-action><act-arg>

```

`<action-list>` is a token list of the form:

```

{\if-type-1} <act-type-1>
{\if-type-2} <act-type-2>
...

```

`\robust@command@act` will iterate over the `<action-list>`, evaluating each `<if-type-n>` `<robust-cmd>` `{\true}``{\false}`. If the `<if-type-n>` conditional returns `<true>`, then `<act-type-n>``<act-arg>` is executed, and the loop ends. If the conditional returns `<false>`, then `<if-type-n + 1>` is executed in the same way, until either one of the conditionals return `<true>`, or the end of the `<action-list>` is reached. If the end is reached, then `<fallback-action>``<act-arg>` is executed before `\robust@command@act` exits.

`\robust@command@act` will start by using `\robust@command@act@chk@args` to check if the `<robust-cmd>` (#2) is a parameterless (possibly `\protected`) macro. If it is not, the command is not a robust command: these always start with a parameterless user-level macro; in that case, `\robust@command@act@end` is used to short-circuit the process and do the `<fallback-action>` (#3). This first test is necessary because later on we need to be able to expand the `<robust-cmd>` without the risk of it Breaking Badly, and as a bonus, this speeds up the process in case we used `\NewCommandCopy` in a “normal” macro.

```

413 \long\def\robust@command@act#1#2#3#4{%

```

```

414 \robust@command@chk@safe#2%
415   {\expandafter\robust@command@act@loop
416     \expandafter#2%
417     #1{\@nnil\@nnil}%
418     \robust@command@act@end}%
419   {\robust@command@act@end}%
420   {#3}{#4}}%

```

If `\robust@command@act@chk@args` branched to false, then `\robust@command@act@loop` will loop over the list of items in the $\langle action-list \rangle$ ($\#1$), and process each item as described earlier. If the $\langle if-type-n \rangle$ command expands to $\langle true \rangle$ then `\robust@command@act@do` is used to execute $\langle act-type-n \rangle$ on the $\langle act-arg \rangle$, otherwise the loop resumes with the next item.

```

421 \long\def\robust@command@act@loop#1#2{\robust@command@act@loop@aux#1#2}
422 \long\def\robust@command@act@loop@aux#1#2#3{%
423   \ifx\@nnil#2%
424   \else
425     #2{#1}%
426     {\robust@command@act@do{#3}}%
427     {\expandafter\robust@command@act@loop\expandafter#1}%
428   \fi}
429 \long\def\robust@command@act@do#1%
430   \fi#2%
431   \robust@command@act@end#3#4{%
432   \fi
433   #1#4}

```

If the end is reached and no action was taken, then do $\langle fallback-action \rangle \langle act-arg \rangle$.

```

\robust@command@act@end 434 \long\def\robust@command@act@end#1#2{#1#2}

```

```

\robust@command@chk@safe 435 \long\def\robust@command@chk@safe#1{%

```

1.5.1 Copying robust commands

```

459 </2ekernel>
460 <latexrelease>\IncludeInRelease{2020-10-01}{\DeclareCommandCopy}
461 <latexrelease> {Add \NewCommandCopy, \RenewCommandCopy, and \DeclareCommandCopy}%
462 <*2ekernel | latexrelease>

```

`\NewCommandCopy` `\NewCommandCopy` starts by checking if #1 is already defined, and raises an error if so, otherwise the definition is carried out. `\RenewCommandCopy` does (almost) the opposite. `\DeclareCommandCopy` If the command is *not* defined, then an error is raised. But the definition is carried out anyway, so the behaviour is consistent with `\renewcommand`.

A `\ProvideCommandCopy` isn't defined because it's not reasonably useful. `\provide...` commands mean "define this if there's no other definition", but copying a command (usually) implies that the command being copied is defined, so `\ProvideCommandCopy` doesn't make a lot of sense. But more importantly, the most common use case of copying a command is to redefine it later, while preserving the old definition, as in:

```

\ProvideCommandCopy \A \B
\renewcommand \B { ... \A ... }

```

then, if `\A` is already defined the first line is skipped, and in this case `\B` won't work as expected.

The three versions call the internal `\declare@commandcopy` with the proper action. `\@firstofone` will carry out the copy. The only case when the copy is not made is the `<false>` case for `\NewCommandCopy`, in which the command already exists and the definition is aborted.

```

463 \def\NewCommandCopy{%
464   \declare@commandcopy
465   {\@firstofone}%
466   {\@firstoftwo\@notdefinable}}
467 \def\RenewCommandCopy{%
468   \declare@commandcopy
469   {\@latex@error{Command \@backslashchar\reserved@a\space undefined}\@ehc
470   \@firstofone}%
471   {\@firstofone}}
472 \def\DeclareCommandCopy{%
473   \declare@commandcopy
474   {\@firstofone}%
475   {\@firstofone}}

```

Start by checking if the command is already defined. The proper action is taken by each specific command above. If all's good, then `\robust@command@act` is called with the proper arguments as described earlier, with `\@declarecommandcopylisthook` as the `<action-list>` and `\declare@commandcopy@let` as the `<fallback-action>`.

```

476 \long\def\declare@commandcopy#1#2#3#4{%
477   \edef\reserved@a{\@expl@cs@to@str@{N#3}}%
478   \@ifundefined\reserved@a{#1}{#2}%
479   {\robust@command@act
480    \@declarecommandcopylisthook#4%
481    \declare@commandcopy@let{#3#4}}}

```

The initial definition of `\@declarecommandcopylisthook` contains the tests for the two types of robust command in the kernel.

```

482 \def\@declarecommandcopylisthook{%
\@declarecommandcopylisthook 483   {\@if@DeclareRobustCommand \@copy@DeclareRobustCommand}%
484   {\@if@newcommand \@copy@newcommand}}

```

The initial definition of `\@declarecommandcopylisthook` contains the tests for the two types of robust command in the kernel.

```

485 \long\def\declare@commandcopy@let#1#2{\let#1=#2\relax}
\declare@commandcopy@let

```

Now the rollback code.

```

486 </2ekernel | latexrelease>
487 <latexrelease>\EndIncludeInRelease
488 <latexrelease>\IncludeInRelease{0000-00-00}{\DeclareCommandCopy}

496 <latexrelease>\EndIncludeInRelease
497 <*2ekernel>

```

(End definition for \NewCommandCopy and others.)

1.5.2 Showing robust commands

`\ShowCommand` Most of the machinery defined for `\NewCommandCopy` can be used to show the definition of a robust command, in a similar fashion to `\texdef`. The difference is that after the command's is detected to has a given type of robustness, rather than making a copy, we use a separate routine to show its definition.

With all the machinery in place, `\ShowCommand` itself is quite simple: use `\robust@command@act` to iterate through the `\@showcommandlisthook` list, and if nothing is found, fallback to `\show`.

```

498 </2ekernel>
499 <latexrelease>\IncludeInRelease{2020-10-01}{\ShowCommand}%
500 <latexrelease> {Add \ShowCommand}%
501 <*2ekernel | latexrelease>
502 \long\def\ShowCommand#1{%
503   \robust@command@act
504   \@showcommandlisthook#1%
505   \show#1}

```

`\@showcommandlisthook` The initial definition of `\@showcommandlisthook` contains the same tests as used for copying, but `\@show@...` commands instead of `\@copy@...`. Same as before, it is initialized to cope with `\DeclareRobustCommand` and `\newcommand` with optional arguments.

```

506 \def\@showcommandlisthook{%
507   {\@if@DeclareRobustCommand \@show@DeclareRobustCommand}%
508   {\@if@newcommand \@show@newcommand}}

```

Now the rollback code.

```

509 </2ekernel | latexrelease>
510 <latexrelease>\EndIncludeInRelease
511 <latexrelease>\IncludeInRelease{0000-00-00}{\ShowCommand}
512 <latexrelease> {Undefine \ShowCommand}%
513 <latexrelease>\let\ShowCommand\@undefined
514 <latexrelease>\let\@showcommandlisthook\@undefined
515 <latexrelease>\EndIncludeInRelease
516 <*2ekernel>

(End definition for \ShowCommand and \@showcommandlisthook.)

517 </2ekernel>
518 <latexrelease>\IncludeInRelease{2020-10-01}{\@if@DeclareRobustCommand}
519 <latexrelease> {Add \@if@DeclareRobustCommand, \@if@newcommand,
520 <latexrelease> \@copy@DeclareRobustCommand, \@copy@newcommand,
521 <latexrelease> \@show@DeclareRobustCommand, \@show@newcommand}%
522 <*2ekernel | latexrelease>

```

1.5.3 Commands defined with \DeclareRobustCommand

`\@if@DeclareRobustCommand` Now that we provided a generic way to copy one macro to another, we need to define a way to check if a command is one of L^AT_EX 2_ε’s robust types. These tests are heavily based on Heiko’s `\LetLtxMacro`, but chopped into separate macros.

`\@if@DeclareRobustCommand` checks if a command `\cmd` was defined by `\DeclareRobustCommand`. The test returns true if the expansion of `\cmd` is exactly `\protect\cmd_`.

```

523 \long\def\@if@DeclareRobustCommand#1{%
524   \begingroup
525     \escapechar='\\
526     \edef\reserved@a{\string#1}%
527     \edef\reserved@b{\detokenize{#1}}%
528     \xdef\@gtempa{%
529       \ifx\reserved@a\reserved@b
530         \noexpand\x@protect
531         \noexpand#1%
532       \fi
533       \noexpand\protect
534       \expandafter\noexpand\csname\@expl@cs@to@str@N#1 \endcsname}%
535   \endgroup
536   \ifx\@gtempa#1\relax
537     \expandafter\@firstoftwo
538   \else
539     \expandafter\@secondoftwo
540   \fi}

```

If a command was defined by `\DeclareRobustCommand` (that is, `\@if@DeclareRobustCommand` returns true), then to make a copy of `\cmd` into `\foo` we define the latter such that it expands to `\protect\foo_`, then make `\foo_` equal to `\cmd_`.

There is one detail we need to take care of: if a command was defined with `\DeclareRobustCommand` it may still have an optional argument, in which case there is one more macro layer before the actual definition of the command. We use `\@if@newcommand` to check that and `\@copy@newcommand` to do the copying.

```

541 \long\def\@copy@DeclareRobustCommand#1#2{%

```

```

542 \begingroup
543   \escapechar='\\
544   \edef\reserved@a{\string#1}%
545   \edef\reserved@b{\detokenize{#1}}%
546   \edef\reserved@a{%
547 \endgroup
548 \def\noexpand#1{%
549   \ifx\reserved@a\reserved@b
550     \noexpand\x@protect
551     \noexpand#1%
552   \fi
553   \noexpand\protect
554   \expandafter\noexpand\csname\@expl@cs@to@str@N#1 \endcsname}%
555 \noexpand\copy@kernel@robust@command
556   \expandafter\noexpand\csname\@expl@cs@to@str@N#1 \endcsname
557   \expandafter\noexpand\csname\@expl@cs@to@str@N#2 \endcsname}%
558 \reserved@a}
559 \long\def\copy@kernel@robust@command#1#2{%
560   \robust@command@chk@safe#2%
561   {\@if@newcommand#2%
562     {\@copy@newcommand}%
563     {\declare@commandcopy@let}}
564   {\declare@commandcopy@let}%
565   #1#2}

```

Showing the command is pretty simple. This command prints the top-level expansion as \TeX 's `\show` would, but with `robust macro:` rather than just `macro:`, then a blank line and then `\show` the inner command. For a macro defined with, say, `\DeclareRobustCommand\foo[1]{bar}`, it will print:

```

> \foo=robust macro:
->\protect \foo .

> \foo =\long macro:
#1->bar.

```

If the inner command is defined with an optional argument, then `\@show@newcommand` is also used.

The value of `\escapechar` is deliberately not enforced, so `\ShowCommand` behaves more like `\show`.

```

566 \long\def\@show@DeclareRobustCommand#1{%
567   \typeout{> \string#1=robust macro:}%
568   \typeout{->\@expl@cs@replacement@spec@N#1.^~J}%
569   \expandafter\show@kernel@robust@command
570   \csname\@expl@cs@to@str@N#1 \endcsname}
571 \long\def\show@kernel@robust@command#1{%
572   \robust@command@chk@safe#1%
573   {\@if@newcommand#1%
574     {\@show@newcommand}%
575     {\show}}}%
576   {\show}%
577   #1}

```

(End definition for \@if@DeclareRobustCommand and others.)

1.5.4 Commands defined with \newcommand (with optional argument)

`\@if@newcommand` A command `\cmd` (or `\cmdL`, if it was defined with `\DeclareRobustCommand`) with an optional argument will expand to `\@protected@testopt\cmd\cmd{<opt>}`. To check that we look at the first three tokens in the expansion of `\cmd`, and return true or false accordingly.

This test *requires* that the command be a parameterless macro, otherwise it will not work (and probably break). This is ensured with `\robust@command@chk@safe` before calling `\@if@newcommand`.

```

578 \long\def\@if@newcommand#1{%
579   \edef\reserved@a{%
580     \noexpand\@protected@testopt
581     \noexpand#1%
582     \expandafter\noexpand\csname\@backslashchar\@expl@cs@to@str@@N#1\endcsname}%
583   \edef\reserved@b{%
584     \unexpanded\expandafter\expandafter\expandafter
585     {\expandafter\@carcube#1{}{}{}\@nil}}%
586   \ifx\reserved@a\reserved@b
587     \expandafter\@firstoftwo
588   \else
589     \expandafter\@secondoftwo
590   \fi}

```

Then, if a command `\cmd` takes an optional argument, we copy it to `\foo` by defining the latter to expand to `\@protected@testopt\foo\foo{<opt>}`.

`\@copy@newcommand`

```

591 \long\def\@copy@newcommand#1#2{%
592   \edef#1{\noexpand\@protected@testopt
593     \noexpand#1%
594     \expandafter\noexpand\csname\@backslashchar\@expl@cs@to@str@@N#1\endcsname
595     \unexpanded\expandafter\expandafter\expandafter
596     {\expandafter\@gobblethree#2}}%
597   \expandafter
598   \let\csname\@backslashchar\@expl@cs@to@str@@N#1\expandafter\endcsname
599   \csname\@backslashchar\@expl@cs@to@str@@N#2\endcsname}

```

A command being `\shown` here is guaranteed to have an optional argument. Start by showing the top-level expansion of the command (using `\typeout` to avoid TeX asking for interaction and extra context lines), then call `\@show@newcommand@aux` with the internal command, which contains the actual definition, and with the expansion of the command to extract the default value of the optional argument.

`\@show@newcommand`
`\@show@newcommand@aux`

```

600 \long\def\@show@newcommand#1{%
601   \typeout{> \string#1=robust macro:}%
602   \typeout{->\@expl@cs@replacement@spec@@N#1.^~J}%
603   \expandafter\@show@newcommand@aux
604   \csname\@backslashchar\@expl@cs@to@str@@N#1\expandafter\endcsname
605   \expandafter{#1}}

```

For a macro defined with, say, `\newcommand\foo[1][opt]{bar}`, it will print:

```

> \foo=robust macro:
->\@protected@testopt \foo \foo {opt}.

> \foo=\long macro:

```

```
> default #1=opt.
[#1]->bar.
```

If the command was defined with `\DeclareRobustCommand`, then another pair of lines show the top-level expansion `\protect_\foo__`.

The extra gymnastics with `\showtokens` ensures that `\showtokens` itself, and the internals of this macro aren't showed in the context lines.

```
606 \long\def\@show@newcommand@aux#1#2{%
607   \typeout{> \string#1=\@expl@cs@prefix@spec@N#1macro:}%
608   \edef\reserved@a{%
609     default \string##1=\expandafter\detokenize\@gobblethree#2.^~J%
610     \@expl@cs@argument@spec@N#1->\@expl@cs@replacement@spec@N#1}%
611   \showtokens\expandafter\expandafter\expandafter{\expandafter\reserved@a}}
```

Now the rollback code.

```
612 </2ekernel | latexrelease>
613 <latexrelease>\EndIncludeInRelease
614 <latexrelease>\IncludeInRelease{0000-00-00}{\@if@DeclareRobustCommand}

1.6 Internal defining commands

These commands are used internally to define other L^AT_EX commands.

`\@ifundefined` Check if first arg is undefined or `\relax` and execute second or third arg depending,

```
630 </2ekernel>
631 <latexrelease>\IncludeInRelease{2018-04-01}{\@ifundefined}
632 <latexrelease>\Leave commands undefined in \@ifundefined}%
633 <*2ekernel | latexrelease>
```

Version using `\ifcsname` to avoid defining undefined tokens to `\relax`. Defined here to simplify using unmatched `\fi`.

```
634 \def\@ifundefined#1{%
635   \ifcsname#1\endcsname\@ifundefin@d@i\else\@ifundefin@d@ii\fi{#1}}
636 \long\def\@ifundefin@d@i#1\fi#2{\fi
637   \expandafter\ifx\csname #2\endcsname\relax
638     \@ifundefin@d@ii
639     \fi
640     \@secondoftwo}
```

```
641 \long\def\@ifundefin@d@ii\fi#1#2#3{\fi #2}
```

Now test of engine.

```
642 \ifx\numexpr\@undefined
```

Classic version (should not be needed as etex is assumed).

```
643 \def\@ifundefined#1{%
644   \expandafter\ifx\csname#1\endcsname\relax
645     \expandafter\@firstoftwo
646   \else
647     \expandafter\@secondoftwo
648   \fi}
649 \else\ifx\directlua\@undefined
```

Use the \ifcsname defined above.

```
650 \else
```

Optimised version for Lua_T_EX, using \lastnamedcs

```
651 \def\@ifundefined#1{%
652   \ifcsname#1\endcsname
653     \expandafter\ifx\lastnamedcs\relax\else\@ifundefin@d@i\fi
654   \fi
655   \@firstoftwo}

656 \long\def\@ifundefin@d@i#1#2#3#4#5{#1#2#5}

657 \fi
658 \fi
659 </2ekernel | latexrelease>
660 <latexrelease>\EndIncludeInRelease
661 <latexrelease>\IncludeInRelease{0000-00-00}{\@ifundefined}
662 <latexrelease>\Leave commands undefined in \@ifundefined}%
663 <latexrelease>\def\@ifundefined#1{%
664 <latexrelease>  \expandafter\ifx\csname#1\endcsname\relax
665 <latexrelease>    \expandafter\@firstoftwo

667 <latexrelease>    \expandafter\@secondoftwo
668 <latexrelease>  \fi}
669 <latexrelease>\EndIncludeInRelease
670 <*2ekernel>
```

(End definition for \@ifundefined.)

\@qend The following define \@qend and \@qrelax to be the strings ‘end’ and ‘relax’ with the
\@qrelax characters \catcoded 12.

```
671 \edef\@qend{\expandafter\@cdr\string\end\@nil}
672 \edef\@qrelax{\expandafter\@cdr\string\relax\@nil}
```

(End definition for \@qend and \@qrelax.)

\@ifnextchar **\@ifnextchar** peeks at the following character and compares it with its first argument.
 If both are the same it executes its second argument, otherwise its third.

```
673 \long\def\@ifnextchar#1#2#3{%
674   \let\reserved@d=#1%
675   \def\reserved@a{#2}%
676   \def\reserved@b{#3}%
677   \futurelet\@let@token\@ifnch}
```

(End definition for \@ifnextchar.)

\kernel@ifnextchar This macro is the kernel version of \@ifnextchar which is used in a couple of places to prevent the AMS variant from being used since in some places this produced chaos (for example if an `fd` file is loaded in a random place then the optional argument to `\ProvidesFile` could get printed there instead of being written only in the log file. This happened when there was a space or a newline between the mandatory and optional arguments! It should really be fixed in the `amsmath` package one day, but...

Note that there may be other places in the kernel where this version should be used rather than the original, but variable, version.

```
678 \let\kernel@ifnextchar\@ifnextchar
```

(End definition for \kernel@ifnextchar.)

\@ifnch \@ifnch is a tricky macro to skip any space tokens that may appear before the character in question. If it encounters a space token, it calls xifnch.

```
679 \def\@ifnch{%
680   \ifx\@let@token\@sptoken
681     \let\reserved@c\@xifnch
682   \else
683     \ifx\@let@token\reserved@d
684       \let\reserved@c\reserved@a
685     \else
686       \let\reserved@c\reserved@b
687     \fi
688   \fi
689   \reserved@c}
```

(End definition for \@ifnch.)

\@sptoken The following code makes \@sptoken a space token. It is important here that the control sequence `\:` consists of a non-letter only, so that the following whitespace is significant. Together with the fact that the equal sign in a `\let` may be followed by only one optional space the desired effect is achieved. NOTE: the following hacking must precede the definition of `\:` as math medium space.

```
690 \def\:{\let\@sptoken= } \: % this makes \@sptoken a space token
```

(End definition for \@sptoken.)

\@xifnch In the following definition of \@xifnch, `\:` is again used to get a space token as delimiter into the definition.

```
691 \def\:{\@xifnch} \expandafter\def\:{\futurelet\@let@token\@ifnch}
```

(End definition for \@xifnch.)

\@ifstar The new implementation below avoids passing the *<true code>* Through one more `\def` than the *<false code>*, which previously meant that `#` had to be written as `####` in one argument, but `##` in the other. The `*` is gobbled by \@firstoftwo.

```
692 \def\@ifstar#1{\@ifnextchar *{\@firstoftwo{#1}}}
```

(End definition for \@ifstar.)

```

\@dblarg
\@xdblarg 693 \long\def\@dblarg#1{\kernel@ifnextchar[{#1}{\@xdblarg{#1}}}{
694 \long\def\@xdblarg#1#2{#1[{#2}]{#2}}

```

(End definition for \@dblarg and \@xdblarg.)

\@sanitize The command \@sanitize changes the catcode of all special characters except for braces to ‘other’. It can be used for commands like \index that want to write their arguments verbatim. Needless to say, this command should only be executed within a group, or chaos will ensue.

```

695 \def\@sanitize{\@makeother\ \@makeother\\\@makeother\$\@makeother\&%
696 \@makeother\#\@makeother\^\@makeother\_ \@makeother\%\@makeother\~}

```

(End definition for \@sanitize.)

\@onelevel@sanitize This makes the whole “meaning” of #1 (its one-level expansion) into catcode 12 tokens: it could be used in \DeclareRobustCommand.

If it is to be used on default float specifiers, this should be done when they are defined.

```

697 \def \@onelevel@sanitize #1{%
698   \edef #1{\expandafter\strip@prefix
699             \meaning #1}%
700 }

```

(End definition for \@onelevel@sanitize.)

\string@makeletter Iterates through a string, turning each alphabetic character into a catcode-11 token (partly undoes a \detokenize). Useful for \ifx-based string comparisons where \detokenize-ing the other string would break too much code.

The macro uses expl3’s \@expl@str@map@function@NN to iterate on the string (without losing spaces) and applies \string@makeletter on each character. The latter checks if character is between a–z or A–Z, and uses \@alph or \@Alph to get the corresponding catcode-11 token. Other tokens are passed through unchanged.

```

729 \DeclareRobustCommand\makeatother{\catcode'\@12\relax}

```

(End definition for \makeatletter and \makeatother.)

2 Discretionary Hyphenation

`\-`
`\@dischph`

Moved here to be after the definition of `\DeclareRobustCommand`.

The primitive `\-` command adds a discretionary hyphen using the current font's `\hyphenchar`. Monospace fonts are usually declared with `\hyphenchar` set to `-1` to suppress hyphenation.

L^AT_EX, from L^AT_EX 2.09 in 1986 defined `\-` by

```
\def\-\{\discretionary{-}{ }{ }}
```

The following comment was added when these commands were first set up, 19 April 1986:

the `\-` command is redefined to allow it to work in the `\ttfamily` type style, where automatic hyphenation is suppressed by setting `\hyphenchar` to `-1`. The original primitive T_EX definition is saved as `\@@hyph` just in case anyone needs it.

L^AT_EX 2_ε, between 1993 and 2017, had a comment at this point saying that the definition “would probably change” because the definition always uses `-`. The definition used below was given in comments at this point during time.

In 2017 we finally enabled this definition by default, with the older L^AT_EX definition accessible via `latexrelease` as usual.

In LuaL^AT_EX the primitive definition of `\-` is used directly because it's use of extended hyphenation parameters means that `\-` works correctly even with `\hyphenchar` set to `-1`. This change makes `\-` under LuaL^AT_EX compatible with language specific hyphenation characters.

Temporary definition of `\@latex@info`, final definition is later.

ltxcmd.dtx

1 Creating document commands

Document commands should be created using the tools provided by this module: `\NewDocumentCommand`, etc., in almost all cases. This allows clean separation of document-level syntax from code-level interfaces. Users have a need to create new document commands, and as such a significant amount of documentation for `ltxcmd` is provided as part of `usrguide3`. Here, additional material aimed at programmers is provided

```

1 <@@=cmd>
2 <*2ekernel>
3 \message{document commands,}
4 </2ekernel>

```

`ltxcmd` code contains an `^^@` character, which usually has catcode 15, so `\IncludeInRelease` will break when this code is being skipped, so we'll save the catcode of `^^@` to restore later:

```

5 <*2ekernel | latexrelease>
6 <latexrelease>\edef\@latexrelease@catcode@null{\the\catcode'\^^@ }
7 <latexrelease>\catcode'\^^@=12
8 <latexrelease>\IncludeInRelease{2021/05/01}%
9 <latexrelease>{\NewDocumentCommand}{Document commands}%
10 \ExplSyntaxOn

```

1.1 Variables and constants

`\l__cmd_arg_spec_tl`

Holds the argument specification after normalization of shorthands.

```

11 \tl_new:N \l__cmd_arg_spec_tl

```

`\l__cmd_args_tl`

Token list variable for grabbed arguments.

```

12 \tl_new:N \l__cmd_args_tl

```

`\l__cmd_args_i_tl`
`\l__cmd_args_ii_tl`

Hold the modified arguments when dealing with default values or processors.

```

13 \tl_new:N \l__cmd_args_i_tl
14 \tl_new:N \l__cmd_args_ii_tl

```

`\l__cmd_current_arg_int`

The number of the current argument being set up: this is used to make sure there are at most 9 arguments, then for creating the expandable auxiliary functions and knowing how many arguments the code function should take.

```

15 \int_new:N \l__cmd_current_arg_int

```

<u>\l__cmd_defaults_bool</u> <u>\l__cmd_defaults_tl</u>	<p>The boolean indicates whether there are any argument with default value other than <code>-NoValue-</code>; the token list holds the code to determine these default values in terms of other arguments.</p> <pre> 16 \bool_new:N \l__cmd_defaults_bool 17 \tl_new:N \l__cmd_defaults_tl </pre>
<u>\l__cmd_environment_bool</u>	<p>Generating environments uses the same mechanism as generating functions. However, full processing of arguments is always needed for environments, and so the function-generating code needs to know this. This variable is also used at run time to give correct error messages.</p> <pre> 18 \bool_new:N \l__cmd_environment_bool </pre>
<u>\l__cmd_environment_str</u>	<p>Name of the environment, used at definition time and at run time.</p> <pre> 19 \str_new:N \l__cmd_environment_str </pre>
<u>\l__cmd_expandable_bool</u>	<p>Used to indicate if an expandable command is begin generated, as this affects both the acceptable argument types and how they are implemented.</p> <pre> 20 \bool_new:N \l__cmd_expandable_bool </pre>
<u>\l__cmd_expandable_aux_name_tl</u>	<p>Used to create pretty-printing names for the auxiliaries: although the immediate definition does not vary, the full expansion does and so it does not count as a constant.</p> <pre> 21 \tl_new:N \l__cmd_expandable_aux_name_tl 22 \tl_set:Nn \l__cmd_expandable_aux_name_tl 23 { 24 \l__cmd_function_tl \c_space_tl 25 (arg~ \int_use:N \l__cmd_current_arg_int) 26 } </pre>
<u>\g__cmd_grabber_int</u>	<p>Used (in exceptional cases) to get unique names for grabbers used by expandable commands.</p> <pre> 27 \int_new:N \g__cmd_grabber_int </pre>
<u>\l__cmd_fn_tl</u>	<p>For passing the pre-formed name of the auxiliary to be used as the parsing function.</p> <pre> 28 \tl_new:N \l__cmd_fn_tl </pre>
<u>\l__cmd_fn_code_tl</u>	<p>For passing the pre-formed name of the auxiliary that contains the actual code.</p> <pre> 29 \tl_new:N \l__cmd_fn_code_tl </pre>

<u>\l__cmd_function_tl</u>	<p>Holds the control sequence name of the function currently being defined: used to avoid passing this as an argument and to avoid repeated use of <code>\cs_to_str:N</code>.</p> <pre>30 \tl_new:N \l__cmd_function_tl</pre>
<u>\l__cmd_grab_expandably_bool</u>	<p>When defining a non-expandable command, indicates whether the arguments can all safely be grabbed by expandable grabbers. This is to support abuses of <code>xparse</code> that use protected functions inside <code>csname</code> constructions.</p> <pre>31 \bool_new:N \l__cmd_grab_expandably_bool</pre>
<u>\l__cmd_obey_spaces_bool</u>	<p>For trailing optionals.</p> <pre>32 \bool_new:N \l__cmd_obey_spaces_bool</pre>
<u>\l__cmd_last_delimiters_tl</u>	<p>Holds the delimiters (first tokens) of all optional arguments since the previous mandatory argument, to warn about cases where it would be impossible to omit optional arguments completely because the following mandatory argument has the same delimiter as one of the optional arguments.</p> <pre>33 \tl_new:N \l__cmd_last_delimiters_tl</pre>
<u>\l__cmd_long_bool</u>	<p>Used to indicate that an argument is long, on a per-argument basis.</p> <pre>34 \bool_new:N \l__cmd_long_bool</pre>
<u>\l__cmd_m_args_int</u>	<p>The number of <code>m</code> arguments: if this is the same as the total number of arguments, then a short-cut can be taken in the creation of the grabber code.</p> <pre>35 \int_new:N \l__cmd_m_args_int</pre>
<u>\l__cmd_prefixed_bool</u>	<p>When preparing the signature of non-expandable commands, indicates that the current argument is affected by a processor or by <code>+</code> (namely is long).</p> <pre>36 \bool_new:N \l__cmd_prefixed_bool</pre>
<u>\l__cmd_process_all_tl</u> <u>\l__cmd_process_one_tl</u> <u>\l__cmd_process_some_bool</u>	<p>When preparing the signature, the processors that will be applied to a given argument are collected in <code>\l__cmd_process_one_tl</code>, while <code>\l__cmd_process_all_tl</code> contains processors for all arguments. The boolean indicates whether there are any processors (to bypass the whole endeavour otherwise).</p> <pre>37 \tl_new:N \l__cmd_process_all_tl 38 \tl_new:N \l__cmd_process_one_tl 39 \bool_new:N \l__cmd_process_some_bool</pre>

\l__cmd_saved_args_tl

Stores \l__cmd_args_tl to deal with space-trimming of b-type arguments.

```
40 \tl_new:N \l__cmd_saved_args_tl
```

\l__cmd_signature_tl

Used when constructing the signature (code for argument grabbing) to hold what will become the implementation of the main function. When arguments are grabbed (at point of use of the command/environment), it also stores the code for grabbing the remaining arguments.

```
41 \tl_new:N \l__cmd_signature_tl
```

\l__cmd_some_obey_spaces_bool**\l__cmd_some_long_bool****\l__cmd_some_short_bool**

These flags are set while normalizing the argument specification. The `obey_spaces` one is used to detect when `!` is used on an argument that is not a trailing optional argument. The other two are used to check whether all short arguments appear before long arguments: this is needed to grab arguments expandably. As soon as the first long argument is seen (other than t-type, whose long status is ignored) the `some_long` flag is set. The `some_short` flag is used for expandable commands, to know whether to define a short auxiliary too.

```
42 \bool_new:N \l__cmd_some_obey_spaces_bool
```

```
43 \bool_new:N \l__cmd_some_long_bool
```

```
44 \bool_new:N \l__cmd_some_short_bool
```

\l__cmd_tmp_prop**\l__cmd_tmptl****\l__cmd_tmptl**

Scratch space.

```
45 \prop_new:N \l__cmd_tmp_prop
```

```
46 \tl_new:N \l__cmd_tmptl
```

```
47 \tl_new:N \l__cmd_tmptl
```

```
48 \cs_new_eq:NN \l__cmd_tmptl ?
```

(End definition for \l__cmd_tmptl.)

With `xparse`, information about commands being (re)defined was switched off by default, unless the `log-declarations` package option was used, so here we'll switch that off as well.

```
49 \msg_redirect_module:nnn { LaTeX / ltcmd } { info } { none }
```

1.2 Declaring commands and environments

__cmd_declare_cmd:Nnn**__cmd_declare_expandable_cmd:Nnn****__cmd_declare_cmd_aux:Nnn****__cmd_declare_cmd_internal:Nnnn****__cmd_declare_cmd_internal:cnxn**

The main functions for creating commands set the appropriate flag then use the same internal code to do the definition.

```
50 \cs_new_protected:Npn \__cmd_declare_cmd:Nnn
```

```
51 {
```

```
52   \bool_set_false:N \l__cmd_expandable_bool
```

```
53   \__cmd_declare_cmd_aux:Nnn
```

```
54 }
```

```
55 \cs_new_protected:Npn \__cmd_declare_expandable_cmd:Nnn
```

```

56 {
57   \bool_set_true:N \l__cmd_expandable_bool
58   \__cmd_declare_cmd_aux:Nnn
59 }

```

The first stage is to log information, both for the user in the log and for programmatic use in a property list of all declared commands.

```

60 \cs_new_protected:Npn \__cmd_declare_cmd_aux:Nnn #1#2#3
61 {
62   \cs_if_exist:NTF #1
63   {
64     \__kernel_msg_info:nxxx { ltcmd } { redefine-command }
65     { \token_to_str:N #1 } { \tl_to_str:n {#2} }
66   }
67   {
68     \bool_lazy_or:nnT
69     { \cs_if_exist_p:c { \cs_to_str:N #1 ~ code } }
70     { \cs_if_exist_p:c { \cs_to_str:N #1 ~ defaults } }
71     {
72       \__kernel_msg_warning:nxx { ltcmd } { unsupported-let }
73       { \token_to_str:N #1 }
74     }
75     \__kernel_msg_info:nxxx { ltcmd } { define-command }
76     { \token_to_str:N #1 } { \tl_to_str:n {#2} }
77   }
78   \bool_set_false:N \l__cmd_environment_bool
79   \__cmd_declare_cmd_internal:Nnnn #1 {#2} {#3} { }
80 }

```

At definition time, the variable `\l__cmd_fn_tl` is only used for error messages. The real business of defining a document command starts with setting up the appropriate name, then normalizing the argument specification to get rid of shorthands.

```

81 \cs_new_protected:Npn \__cmd_declare_cmd_internal:Nnnn #1#2#3#4
82 {
83   \tl_set:Nx \l__cmd_function_tl { \cs_to_str:N #1 }
84   \tl_set:Nx \l__cmd_fn_tl
85   { \exp_not:c { \l__cmd_function_tl \c_space_tl } }
86   \__cmd_normalize_arg_spec:n {#2}
87   \exp_args:No \__cmd_prepare_signature:n \l__cmd_arg_spec_tl
88   \__cmd_declare_cmd_code:Nnn #1 {#2} {#3}
89   #4
90   \__cmd_break_point:n {#2}
91 }
92 \cs_generate_variant:Nn \__cmd_declare_cmd_internal:Nnnn { cnx }

```

(End definition for `__cmd_declare_cmd:Nnn` and others.)

`__cmd_break_point:n` A marker used to escape from creating a definition if necessary.

```

93 \cs_new_eq:NN \__cmd_break_point:n \use_none:n

```

(End definition for `__cmd_break_point:n`.)

`__cmd_declare_cmd_code:Nnn` The appropriate auxiliary is called.

```

\__cmd_declare_cmd_code_aux:Nnn 94 \cs_new_protected:Npn \__cmd_declare_cmd_code:Nnn
\__cmd_declare_cmd_code_expandable:Nnn 95 {

```

```

96   \bool_if:NTF \l__cmd_grab_expandably_bool
97   { \__cmd_declare_cmd_code_expandable:Nnn }
98   { \__cmd_declare_cmd_code_aux:Nnn }
99   }

```

Standard functions call `__cmd_start:nNNnnn`, which receives the argument specification, an auxiliary used for grabbing arguments, an auxiliary containing the code, and then the signature, default arguments, and processors.

```

100 \cs_new_protected:Npn \__cmd_declare_cmd_code_aux:Nnn #1#2#3

125     }
126   }
127 }

```

Expandable functions and functions whose arguments can be grabbed expandably call `__cmd_start_expandable:nNNNNn`, which receives the argument specification, four auxiliaries (two for grabbing arguments, one for the code, and one for default arguments), and finally the signature. Non-expandable functions that take this branch should nevertheless be protected, as well as their `code` function. They will only be expanded in contexts such as constructing a `csname`. The two grabbers (named after the function with one or two spaces) are needed when there are both short and long arguments; otherwise the same grabber is included twice in the definition. If all arguments are long or all are short the (only) grabber is defined correspondingly to be long/short. Otherwise two grabbers are defined, one long, one short.

```

```

(End definition for `__cmd_declare_cmd_code:Nnn`, `__cmd_declare_cmd_code_aux:Nnn`, and `__cmd_declare_cmd_code_expandable:Nnn`.)

`__cmd_declare_env:nnnn` The lead-off to creating an environment is much the same as that for creating a command: issue the appropriate message, store the argument specification then hand off to an internal function.

`__cmd_declare_env_internal:nnnn`

```

174 \cs_new_protected:Npn \__cmd_declare_env:nnnn #1#2
175 {
176   \str_set:Nx \l__cmd_environment_str {#1}
177   \str_set:Nx \l__cmd_environment_str
178   { \tl_trim_spaces:o { \l__cmd_environment_str } }
179   \cs_if_exist:CTF { \l__cmd_environment_str }
180   {
181     \__kernel_msg_info:nxxx { ltcmd } { redefine-environment }

```

```

182     { \l__cmd_environment_str } { \tl_to_str:n {#2} }
183   }
184   {
185     \__kernel_msg_info:nxxx { ltcmd } { define-environment }
186     { \l__cmd_environment_str } { \tl_to_str:n {#2} }
187   }
188   \bool_set_false:N \l__cmd_expandable_bool
189   \bool_set_true:N \l__cmd_environment_bool
190   \exp_args:NV \__cmd_declare_env_internal:nnnn
191     \l__cmd_environment_str {#2}
192 }

```

Creating a document environment requires a few more steps than creating a single command. In order to pass the arguments of the command to the end of the function, it is necessary to store the grabbed arguments. To do that, the function used at the end of the environment has to be redefined to contain the appropriate information. To minimize the amount of expansion at point of use, the code here is expanded now as well as when used. The last argument of `__cmd_declare_cmd_internal:Nnnn` is only run if the definition succeeded. In package mode this ensures that the original definition of the environment is not changed if the definition fails for any reason. This also avoids an error when defining the `end_au_x` function when the user asks for more than 9 arguments.

```

193 \cs_new_protected:Npn \__cmd_declare_env_internal:nnnn #1#2#3#4
194 {
195   \__cmd_declare_cmd_internal:cnxn { environment~ #1 } {#2}

211       \cs_set_eq:cc { end #1 } { environment~ #1 ~end }
212   }
213 }

```

(End definition for `__cmd_declare_env:nnnn` and `__cmd_declare_env_internal:nnnn`.)

1.3 Structure of `xparse` commands

```

\__cmd_start_env:nnnnn
\__cmd_start:nNNnnn

```

For error messages that occur during run-time when getting arguments of environments it is necessary to keep track of the environment name. We begin non-expandable commands with a token equal to `\scan_stop:`, whose name gives a reasonable error message if the command is used inside a `csname` and protects against `f`-expansion. This is useless for environments since `\begin` is already not expandable. Both the command and environment codes start with `\group_align_safe_begin:`, then `__cmd_run_code:` (used

by both) does `\group_align_safe_end:`, so that delimited arguments may be grabbed in alignments if they contain an alignment tab token (see [latex3/latex3/issues/839](#)).

```

214 \cs_new_protected:Npn \__cmd_start_env:nnnnn #1#2
215 {
216   \conditionally@traceoff
217   \group_align_safe_begin:
218   \str_set:Nn \l__cmd_environment_str {#2}
219   \bool_set_true:N \l__cmd_environment_bool
220   \__cmd_start_aux:ccnnnn
221   { environment~ \l__cmd_environment_str \c_space_tl }
222   { environment~ \l__cmd_environment_str \c_space_tl code }
223   {#1}
224 }
225 \cs_new_protected:Npx \__cmd_start:nNNnnn #1#2#3
226 {
227   \exp_not:c { xparse~function~is~not~expandable }
228   \exp_not:N \conditionally@traceoff
229   \exp_not:N \group_align_safe_begin:
230   \exp_not:n { \bool_set_false:N \l__cmd_environment_bool }
231   \exp_not:N \__cmd_start_aux:NNnnnn
232   #2 #3 {#1}
233 }

```

(End definition for `__cmd_start_env:nnnnn` and `__cmd_start:nNNnnn`.)

`__cmd_start_aux:NNnnnn` This sets up a few variables to minimize the boilerplate code included in all `xparse`-defined commands. It then runs the grabbers `#4`. Again, the argument specification `#1` is only for diagnostics.

`__cmd_start_aux:ccnnnn`

```

234 \cs_new_protected:Npn \__cmd_start_aux:NNnnnn #1#2#3#4#5#6
235 {
236   \tl_clear:N \l__cmd_args_tl
237   \tl_set:Nn \l__cmd_fn_tl {#1}
238   \tl_set:Nn \l__cmd_fn_code_tl {#2}
239   \tl_set:Nn \l__cmd_defaults_tl {#5}
240   \tl_set:Nn \l__cmd_process_all_tl {#6}
241   #4 \__cmd_run_code:
242 }
243 \cs_generate_variant:Nn \__cmd_start_aux:NNnnnn { cc }

```

(End definition for `__cmd_start_aux:NNnnnn`.)

`__cmd_run_code:` After arguments are grabbed, this function is responsible for inserting default values, running processors, and finally doing `\group_align_safe_end:` as promised, and running the code.

```

244 \cs_new_protected:Npn \__cmd_run_code:
245 {
246   \tl_if_empty:NF \l__cmd_defaults_tl { \__cmd_defaults: }
247   \tl_if_empty:NF \l__cmd_process_all_tl { \__cmd_args_process: }
248   \group_align_safe_end:
249   \conditionally@traceon
250   \exp_after:wN \l__cmd_fn_code_tl \l__cmd_args_tl
251 }

```

(End definition for `__cmd_run_code:`.)

`_cmd_defaults:` First construct `_cmd_tmp:w` (see below) that will receive the arguments found so far
`_cmd_defaults_def:` and determine default values for any missing argument. Then call it repeatedly until the
`_cmd_defaults_def:nn` set of arguments stabilizes. Since that could lead to an infinite loop we only call it up to
`_cmd_defaults_def:nnn` nine times, the maximal number needed for stabilization if there is a chain of arguments
`_cmd_defaults_aux:` that depend on each other. If that fails to stabilize raise an error.
`_cmd_defaults_error:w`

```

252 \cs_new_protected:Npn \\_cmd_defaults:
253 {
254   \\_cmd_defaults_def:
255   \tl_set_eq:NN \l__cmd_args_i_tl \l__cmd_args_tl
256   \\_cmd_defaults_aux: \\_cmd_defaults_aux: \\_cmd_defaults_aux:

325     { \tl_count:N \l\_cmd_args_tl } {#1}
326     \exp_args:NNNo \exp_after:wN \_cmd_tmp:w \l\_cmd_args_tl
327     { \ProcessedArgument }
328 }

```

(End definition for _cmd_args_process:, _cmd_args_process_loop:nn, and _cmd_args_process_aux:n.)

_cmd_start_expandable:nNNNNn This is called for all expandable commands. #6 is the signature, responsible for grabbing arguments. #5 is used to determine default values (or is ? if there are none). #4 is the code to run. #2 and #3 are functions (named after the command) that grab a single argument in the input stream (#3 is short). The argument specification #1 is only used by diagnostic functions. Same as for the non-expandable version, this starts with \group_align_safe_begin:, which expands to nothing, so may be safely used in an expandable context.

```

329 \cs_new:Npn \_cmd_start_expandable:nNNNNn #1#2#3#4#5#6
330 {

```

```

331 \group_align_safe_begin:

  \_cmd_end_expandable_aux:nnnn
\_cmd_end_expandable_defaults:nnnNn
  \_cmd_end_expandable_defaults:nnw
  \_cmd_end_expandable_defaults:nw

```

Followed by a function #1 to determine default values (or ? if there are no defaults), the code #2, arguments that have been grabbed, then \q_cmd and two generic grabbers. The idea to find default values is similar to the non-expandable case but we cannot define an auxiliary function, so at every step in the loop we need to go through all arguments searching for which ones started out as -NoValue- and replacing these by the newly computed values. In fact we need to keep track of three versions of all arguments: the original version, the previous version with default values, and the currently built version (first argument of _cmd_end_expandable_defaults:nnnNn).

```

(End definition for _cmd_end_expandable:NNw and others.)

1.4 Normalizing the argument specifications

The goal here is to expand aliases and check that the argument specification is valid before the main parsing run. If it is not valid the entire set up is abandoned to avoid any strange internal errors. A function is provided for each argument type that will grab any extra data items and call the loop function after performing the following checks and tasks.

- Check that each argument has the correct number of data items associated with it, and that where a single character is required, one has actually been supplied.
- Check that processors and the markers + and ! are followed by an argument for which they make sense, and are not redundant.
- Check the absence of forbidden types for expandable commands, namely G/v always, and l/u after optional arguments (xparse may have inserted braces due to a failed search for an optional argument).
- Check that no optional argument is followed by a mandatory argument with the same delimiter, as otherwise the optional argument could never be omitted.
- Keep track in \l__cmd_some_long_bool and \l__cmd_some_short_bool of whether the command has some long/short arguments.
- Keep track in \l__cmd_grab_expandably_bool of whether all arguments are m/l/u type and short arguments appear before long ones, in which case they can be grabbed expandably just as safely as they could be grabbed nonexpandably. Regardless of that, arguments of expandable commands will be grabbed expandably and arguments of environments will not (because the list of arguments built by non-expandable grabbing is used to pass them to the end-environment code).

Further checks happen at the end of the loop:

- that there are at most 9 arguments;
- that an expandable command does not end with an optional argument (this case is detected by using the fact that \l__cmd_last_delimiters_tl is cleared by every mandatory argument and filled by every optional argument).

```

\__cmd_normalize_arg_spec:n Loop through the argument specification, calling an auxiliary specific to each argument
\__cmd_normalize_arg_spec_loop:n type. If any argument is unknown stop the definition.

__cmd_normalize_type_D:w
 __cmd_normalize_type_E:w
 __cmd_normalize_type_t:w
 __cmd_normalize_E_unique_check:w

Optional argument types. Check that all required data is present (and consists of single characters if applicable) and check for forbidden types for expandable commands. For E-type require that there is at least one embellishment, that each one is a single character, and that there aren't more optional arguments than embellishments; also remember that each embellishment counts as one argument for \l__cmd_current_arg_int. Then in each case store the data in \l__cmd_arg_spec_tl, and for later checks store in \l__cmd_last_delimiters_tl the tokens whose presence determines whether there is an optional argument (for braces store {}, seen later as an empty delimiter).

588     \_cmd_bad_def:wn
589   }
590 }

```

(End definition for `_cmd_single_token_check:n`.)

`_cmd_allowed_token_check:N` Some tokens are now allowed as delimiters for some argument types, notably implicit begin/end-group tokens (`\bgroup`/`\egroup`). The major problem with these tokens is that for `\peek...` functions, a literal `{_1` is virtually indistinguishable from a `\bgroup` or other token which was `\let` to a `{_1`, and the same goes for `_2`. All other tokens can be easily distinguished from their implicit counterparts by grabbing them and looking at the string length (see `_cmd_token_if_cs:N`), but for begin/end group tokens that is not possible without the risk of mistakenly grabbing the entire brace group (potentially leading to a ! Runaway argument error) or trying to grab a `_2`, leading to an ! Argument of `\dots` has an extra `}` error.

```

591 \cs_new_protected:Npn \_cmd_allowed_token_check:N #1
592 {
593   \token_if_eq_meaning:NNTF #1 \c_group_begin_token
594   { \use:n }

```

(End definition for __cmd_add_arg_spec:n and __cmd_add_arg_spec_mandatory:n.)

1.5 Preparing the signature: general mechanism

Actually creating the signature uses the same loop approach as normalizing the signature. There are first a number of variables which need to be set to track what is going on. Many of these variables are unused when defining expandable commands.

```

689 \cs_new_protected:Npn \__cmd_prepare_signature:n #1
690 {
691   \int_zero:N \l__cmd_current_arg_int
692   \bool_set_false:N \l__cmd_long_bool
693   \bool_set_false:N \l__cmd_obey_spaces_bool
694   \int_zero:N \l__cmd_m_args_int
695   \bool_set_false:N \l__cmd_defaults_bool
696   \tl_clear:N \l__cmd_defaults_tl
697   \tl_clear:N \l__cmd_process_all_tl
698   \tl_clear:N \l__cmd_process_one_tl
699   \bool_set_false:N \l__cmd_process_some_bool
700   \tl_clear:N \l__cmd_signature_tl
701   \__cmd_prepare_signature:N #1 \q_recursion_tail \q_recursion_stop
702   \bool_if:NF \l__cmd_expandable_bool { \__cmd_flush_m_args: }
703 }

```

The main looping function does not take an argument, but carries out the reset on the processor boolean. This is split off from the rest of the process so that when actually setting up processors the flag-reset can be bypassed.

For each known argument type there is an appropriate function to actually do the addition to the signature. These are separate for expandable and standard functions, as the approaches are different.

```

704 \cs_new_protected:Npn \__cmd_prepare_signature:N
705 {
706   \bool_set_false:N \l__cmd_prefixed_bool
707   \__cmd_prepare_signature_bypass:N
708 }
709 \cs_new_protected:Npn \__cmd_prepare_signature_bypass:N #1
710 {
711   \quark_if_recursion_tail_stop:N #1
712   \use:c
713   {
714     __cmd_add
715     \bool_if:NT \l__cmd_grab_expandably_bool { _expandable }
716     _type_ \token_to_str:N #1 :w
717   }
718 }

```

(End definition for `_cmd_prepare_signature:n`, `_cmd_prepare_signature:N`, and `_cmd_prepare_signature_bypass:N`.)

1.6 Setting up a standard signature

Each argument-adding function appends to the signature a grabber (and for some types, the delimiters or default value), except the one for `m` arguments. These are collected and added to the signature all at once by `_cmd_flush_m_args:`, called for every other argument type. All of the functions then call the loop function `_cmd_prepare_signature:N`. Default values of arguments are collected by `_cmd_add_default:n` rather than being stored with the argument; this function and `_cmd_add_default:` are also responsible for keeping track of `\l__cmd_current_arg_int`.

`_cmd_add_type_+:w` Making the next argument long means setting the flag. The `m` arguments are recorded here as this has to be done for every case where there is then a long argument.

```

719 \cs_new_protected:cpn { __cmd_add_type_+:w }
720 {
721   \_cmd_flush_m_args:
722   \bool_set_true:N \l__cmd_long_bool
723   \bool_set_true:N \l__cmd_prefixed_bool
724   \_cmd_prepare_signature_bypass:N
725 }
```

(End definition for `_cmd_add_type_+:w`.)

`_cmd_add_type_!:w` Much the same for controlling trailing optional arguments.

```

726 \cs_new_protected:cpn { __cmd_add_type_!:w }
727 {
728   \_cmd_flush_m_args:
729   \bool_set_true:N \l__cmd_obey_spaces_bool
730   \bool_set_true:N \l__cmd_prefixed_bool
731   \_cmd_prepare_signature_bypass:N
732 }
```

(End definition for `_cmd_add_type_!:w`.)

`_cmd_add_type_>:w` When a processor is found, the processor code is stored. It will be used by `_cmd_args_process:` once arguments are all found. Here too the loop calls `_cmd_prepare_signature_bypass:N` rather than `_cmd_prepare_signature:N` so that the flag is not reset.

```

733 \cs_new_protected:cpn { __cmd_add_type_>:w } #1
734 {
735   \_cmd_flush_m_args:
736   \bool_set_true:N \l__cmd_prefixed_bool
737   \bool_set_true:N \l__cmd_process_some_bool
738   \tl_put_left:Nn \l__cmd_process_one_tl { {#1} }
739   \_cmd_prepare_signature_bypass:N
740 }
```

(End definition for `_cmd_add_type_>:w`.)

__cmd_add_type_b:w

```
741 \cs_new_protected:Npn \__cmd_add_type_b:w
742 {
743   \__cmd_flush_m_args:
744   \__cmd_add_default:
745   \__cmd_add_grabber:N b
746   \__cmd_prepare_signature:N
747 }
```

(End definition for __cmd_add_type_b:w.)

__cmd_add_type_D:w

```
748 \cs_new_protected:Npn \__cmd_add_type_D:w #1#2#3
749 {
750   \__cmd_flush_m_args:
751   \__cmd_add_default:n {#3}
752   \__cmd_add_grabber:N D
753   \tl_put_right:Nn \l__cmd_signature_tl { #1 #2 }
754   \__cmd_prepare_signature:N
755 }
```

(End definition for __cmd_add_type_D:w.)

__cmd_add_type_E:w The E-type argument needs a special handling of default values.

```
756 \cs_new_protected:Npn \__cmd_add_type_E:w #1#2
757 {
758   \__cmd_flush_m_args:
759   \__cmd_add_default_E:nn {#1} {#2}
760   \__cmd_add_grabber:N E
761   \tl_put_right:Nn \l__cmd_signature_tl { {#1} }
762   \__cmd_prepare_signature:N
763 }
```

(End definition for __cmd_add_type_E:w.)

__cmd_add_type_m:w The m type is special as short arguments which are not post-processed are simply counted at this stage. Thus there is a check to see if either of these cases apply. If so, a one-argument grabber is added to the signature. On the other hand, if a standard short argument is required it is simply counted at this stage, to be added later using __cmd_flush_m_args:.

```
764 \cs_new_protected:Npn \__cmd_add_type_m:w
765 {
766   \__cmd_add_default:
767   \bool_if:NTF \l__cmd_prefixed_bool
768     { \__cmd_add_grabber:N m }
769     { \int_incr:N \l__cmd_m_args_int }
770   \__cmd_prepare_signature:N
771 }
```

(End definition for __cmd_add_type_m:w.)

`__cmd_add_type_R:w` The R-type argument is very similar to the D-type.

```

772 \cs_new_protected:Npn \__cmd_add_type_R:w #1#2#3
773 {
774   \__cmd_flush_m_args:
775   \__cmd_add_default:n {#3}
776   \__cmd_add_grabber:N R
777   \tl_put_right:Nn \l__cmd_signature_tl { #1 #2 }
778   \__cmd_prepare_signature:N
779 }

```

(End definition for __cmd_add_type_R:w.)

`__cmd_add_type_t:w` Setting up a t argument means collecting one token for the test, and adding it along with the grabber to the signature.

```

780 \cs_new_protected:Npn \__cmd_add_type_t:w #1
781 {
782   \__cmd_flush_m_args:
783   \__cmd_add_default:
784   \__cmd_add_grabber:N t
785   \tl_put_right:Nn \l__cmd_signature_tl {#1}
786   \__cmd_prepare_signature:N
787 }

```

(End definition for __cmd_add_type_t:w.)

`__cmd_add_type_v:w` At this stage, the v argument is identical to l except that since the grabber may fail to read a verbatim argument we need a default value.

```

788 \cs_new_protected:Npn \__cmd_add_type_v:w
789 {
790   \__cmd_flush_m_args:
791   \exp_args:No \__cmd_add_default:n \c_novalue_tl
792   \__cmd_add_grabber:N v
793   \__cmd_prepare_signature:N
794 }

```

(End definition for __cmd_add_type_v:w.)

`__cmd_flush_m_args:` As m arguments are simply counted, there is a need to add them to the token register in a block. As this function can only be called if something other than m turns up, the flag can be switched here.

```

795 \cs_new_protected:Npn \__cmd_flush_m_args:
796 {
797   \int_compare:nNnT \l__cmd_m_args_int > 0
798   {
799     \tl_put_right:Nx \l__cmd_signature_tl
800     { \exp_not:c { __cmd_grab_m_ \int_use:N \l__cmd_m_args_int :w } }
801     \tl_put_right:Nx \l__cmd_process_all_tl
802     { \prg_replicate:nn { \l__cmd_m_args_int } { { } } }
803   }
804   \int_zero:N \l__cmd_m_args_int
805 }

```

(End definition for __cmd_flush_m_args:.)

`__cmd_add_grabber:N` To keep the various checks needed in one place, adding the grabber to the signature is done here. The only questions are whether the grabber should be long or not, and whether to obey spaces. The `\l__cmd_obey_spaces_bool` boolean can only be `true` for trailing optional arguments. In that case spaces will not be ignored when looking for that optional argument.

```

806 \cs_new_protected:Npn \__cmd_add_grabber:N #1
807 {
808   \tl_put_right:Nx \l__cmd_signature_tl
809   {
810     \exp_not:c
811     {
812       __cmd_grab_ #1
813       \bool_if:NT \l__cmd_long_bool { _long }
814       \bool_if:NT \l__cmd_obey_spaces_bool { _obey_spaces }
815       :w
816     }
817   }
818   \bool_set_false:N \l__cmd_long_bool
819   \bool_set_false:N \l__cmd_obey_spaces_bool
820   \tl_put_right:Nx \l__cmd_process_all_tl
821   { { \exp_not:o \l__cmd_process_one_tl } }
822   \tl_clear:N \l__cmd_process_one_tl
823 }

```

(End definition for `__cmd_add_grabber:N`.)

`__cmd_add_default:n` Store the default value of an argument, or rather code that gives that default value (it may involve other arguments). This is `\c_novalue_tl` for arguments with no actual default or with default `-NoValue-`; and (in a brace group) `\prg_do_nothing:` followed by a default value for others. For E-type arguments, pad the defaults `#2` with some `\c_novalue_tl` until there are as many as embellishments `#1`. These functions are also used when defining expandable commands.

```

824 \cs_new_protected:Npn \__cmd_add_default:n #1
825 {
826   \tl_if_novalue:nTF {#1}
827   { \__cmd_add_default: }
828   {
829     \int_incr:N \l__cmd_current_arg_int
830     \bool_set_true:N \l__cmd_defaults_bool
831     \tl_put_right:Nn \l__cmd_defaults_tl { { \prg_do_nothing: #1 } }
832   }
833 }
834 \cs_new_protected:Npn \__cmd_add_default:
835 {
836   \int_incr:N \l__cmd_current_arg_int
837   \tl_put_right:Nn \l__cmd_defaults_tl { \c_novalue_tl }
838 }
839 \cs_new_protected:Npn \__cmd_add_default_E:nn #1#2
840 {
841   \tl_map_function:nN {#2} \__cmd_add_default:n
842   \prg_replicate:nn
843   { \tl_count:n {#1} - \tl_count:n {#2} }
844   { \__cmd_add_default: }
845 }

```

(End definition for `_cmd_add_default:n`, `_cmd_add_default:`, and `_cmd_add_default_E:nn`.)

1.7 Setting up expandable types

The approach here is not dissimilar to that for standard types, but fewer types are supported. There is also a need to define the per-function auxiliaries: this is done here, while the general grabbers are dealt with later.

`_cmd_add_expandable_type+:w`

We have already checked that short arguments are before long arguments, so `\l__cmd_long_bool` only changes from `false` to `true` once (and there is no need to reset it after each argument). Also knock back the argument count because `+` is not an argument. Continue the loop.

```
846 \cs_new_protected:cpn { \_cmd_add_expandable_type+:w }
847 {
848   \bool_set_true:N \l__cmd_long_bool
849   \__cmd_prepare_signature:N
850 }
```

(End definition for `_cmd_add_expandable_type+:w`.)

`_cmd_add_expandable_type_D:w`

The set up for D-type arguments involves constructing a rather complex auxiliary which is used repeatedly when grabbing. There is an auxiliary here so that the R-type can share code readily: `#1` is D or R. The `_aux:NN` auxiliary is needed if the two delimiting tokens are identical: in contrast to the non-expandable route, the grabber here has to act differently for this case.

```
851 \cs_new_protected:Npn \_cmd_add_expandable_type_D:w
852 { \_cmd_add_expandable_type_D_aux:NNNn D }
853 \cs_new_protected:Npn \_cmd_add_expandable_type_D_aux:NNNn #1#2#3#4
854 {
855   \__cmd_add_default:n {#4}
856   \tl_if_eq:nnTF {#2} {#3}
857     { \_cmd_add_expandable_type_D_aux:NN #1 #2 }
858     { \_cmd_add_expandable_type_D_aux:NNN #1 #2 #3 }
859   \__cmd_prepare_signature:N
860 }
861 \cs_new_protected:Npn \_cmd_add_expandable_type_D_aux:NNN #1#2#3
862 {
863   \bool_if:NTF \l__cmd_long_bool
864     { \cs_set:cpx }
865     { \cs_set_nopar:cpx }
866     { \l__cmd_expandable_aux_name_tl } ##1 ##2 #2 ##3 \q__cmd ##4 #3
867     { ##1 {##2} {##3} {##4} }
868   \_cmd_add_expandable_grabber:nn {#1}
869   {
870     \exp_not:c { \l__cmd_expandable_aux_name_tl }
871     \exp_not:n { #2 #3 }
872   }
873 }
874 \cs_new_protected:Npn \_cmd_add_expandable_type_D_aux:NN #1#2
875 {
876   \bool_if:NTF \l__cmd_long_bool
877     { \cs_set:cpx }
878     { \cs_set_nopar:cpx }
```

```

879     { \l__cmd_expandable_aux_name_tl } ##1 #2 ##2 #2
880     { ##1 {##2} }
881   \__cmd_add_expandable_grabber:nn { #1_alt }
882   {
883     \exp_not:c { \l__cmd_expandable_aux_name_tl }
884     \exp_not:n {#2}
885   }
886 }

```

(End definition for __cmd_add_expandable_type_D:w and others.)

__cmd_add_expandable_type_E:w
 __cmd_add_expandable_type_E_aux:n

For each embellishment, use __cmd_get_grabber:NN to obtain an auxiliary delimited by that token and store a pair constituted of the auxiliary and the token in \l__cmd_tmpb_tl, before appending the whole set of these pairs to the signature, and an equal number of -NoValue- markers (regardless of the default values of arguments). Set the current argument appropriately.

```

887 \cs_new_protected:Npn \__cmd_add_expandable_type_E:w #1#2
888 {
889   \__cmd_add_default_E:nn {#1} {#2}
890   \tl_clear:N \l__cmd_tmpb_tl
891   \tl_map_function:nN {#1} \__cmd_add_expandable_type_E_aux:n
892   \__cmd_add_expandable_grabber:nn
893   { E \bool_if:NT \l__cmd_long_bool { _long } }
894   {
895     { \exp_not:o \l__cmd_tmpb_tl }
896     {
897       \prg_replicate:nn { \tl_count:n {#1} }
898       { { \c_novalue_tl } }
899     }
900   }
901   \__cmd_prepare_signature:N
902 }
903 \cs_new_protected:Npn \__cmd_add_expandable_type_E_aux:n #1
904 {
905   \__cmd_get_grabber:NN #1 \l__cmd_tmpa_tl
906   \tl_put_right:Nx \l__cmd_tmpb_tl
907   { \exp_not:o \l__cmd_tmpa_tl \exp_not:N #1 }
908 }

```

(End definition for __cmd_add_expandable_type_E:w and __cmd_add_expandable_type_E_aux:n.)

__cmd_add_expandable_type_m:w

Unlike the standard case, when working expandably each argument is always grabbed separately.

```

909 \cs_new_protected:Npn \__cmd_add_expandable_type_m:w
910 {
911   \__cmd_add_default:
912   \__cmd_add_expandable_grabber:nn
913   { m \bool_if:NT \l__cmd_long_bool { _long } } { }
914   \__cmd_prepare_signature:N
915 }

```

(End definition for __cmd_add_expandable_type_m:w.)

`_cmd_add_expandable_type_R:w` The R-type is very similar to the D-type argument, and so the same internals are used.

```
916 \cs_new_protected:Npn \_cmd_add_expandable_type_R:w
917   { \_cmd_add_expandable_type_D_aux:NNNn R }
```

(End definition for `_cmd_add_expandable_type_R:w`.)

`_cmd_add_expandable_type_t:w` An auxiliary delimited by #1 is built now. It will be used to test for the presence of that token.

```
918 \cs_new_protected:Npn \_cmd_add_expandable_type_t:w #1
919   {
920     \_cmd_add_default:
921     \_cmd_get_grabber:NN #1 \l__cmd_tmpa_tl
922     \_cmd_add_expandable_grabber:nn { t }
923     {
924       \exp_not:o \l__cmd_tmpa_tl
925       \exp_not:N #1
926     }
927     \_cmd_prepare_signature:N
928   }
```

(End definition for `_cmd_add_expandable_type_t:w`.)

`_cmd_add_expandable_grabber:nn` This is called for all arguments to place the right grabber in the signature.

```
929 \cs_new_protected:Npn \_cmd_add_expandable_grabber:nn #1#2
930   {
931     \tl_put_right:Nx \l__cmd_signature_tl
932       { \exp_not:c { \_cmd_expandable_grab_ #1 :w } #2 }
933   }
```

(End definition for `_cmd_add_expandable_grabber:nn`.)

`_cmd_get_grabber:NN`
`_cmd_get_grabber_auxi:NN`
`_cmd_get_grabber_auxii:NN` Given a token #1, defines an expandable function delimited by that token and stores it in the token list #2. The function is named after the token, unless that function name is already taken by some other grabber (this can happen in the rare case where delimiters with different category codes are used in the same document): in that case use a global counter to get a unique name. Since the grabbers are not named after `xparse` commands they should not be used to get material from the input stream.

```
934 \cs_new_protected:Npn \_cmd_get_grabber:NN #1#2
935   {
936     \cs_set:Npn \_cmd_tmp:w ##1 #1 {##1}
937     \exp_args:Nc \_cmd_get_grabber_auxi:NN
938       { \_cmd_grabber_ \token_to_str:N #1 :w } #2
939   }
940 \cs_new_protected:Npn \_cmd_get_grabber_auxi:NN #1#2
941   {
942     \cs_if_eq:NNTF \_cmd_tmp:w #1
943       { \tl_set:Nn #2 {#1} }
944       {
945         \cs_if_exist:NTF #1
946           {
947             \int_gincr:N \g__cmd_grabber_int
948             \exp_args:Nc \_cmd_get_grabber_auxi:NN
949               {
950                 \_cmd_grabber_
```

```

951         - \int_use:N \g__cmd_grabber_int :w
952     }
953     #2
954 }
955 { \__cmd_get_grabber_auxii:NN #1 #2 }
956 }
957 }
958 \cs_new_protected:Npn \__cmd_get_grabber_auxii:NN #1#2
959 {
960     \cs_set_eq:NN #1 \__cmd_tmp:w
961     \tl_set:Nn #2 {#1}
962 }

```

(End definition for __cmd_get_grabber:NN, __cmd_get_grabber_auxi:NN, and __cmd_get_grabber_auxii:NN.)

1.8 Grabbing arguments

All of the grabbers follow the same basic pattern. The initial function stores in `\l__cmd_signature_tl` the code to grab further arguments, defines (the function in) `\l__cmd_fn_tl` that will grab the argument, and calls it.

Defining `\l__cmd_fn_tl` means determining whether to use `\cs_set:Npn` or `\cs_set_nopar:Npn`, and for optional arguments whether to skip spaces. Once the argument is found, `\l__cmd_fn_tl` calls `__cmd_add_arg:n`, responsible for calling processors and grabbing further arguments.

```

\__cmd_grab_b:w
\__cmd_grab_b_long:w
\__cmd_grab_b_obey_spaces:w
\__cmd_grab_b_long_obey_spaces:w
\__cmd_grab_b_aux:NNw
\__cmd_grab_b_end:Nw

```

This uses the well-tested code of D-type arguments, skipping the peeking step because the b-type argument is always present, and adding a cleanup stage at the end by hijacking the signature. The clean-up consists of properly dealing with `\l__cmd_args_tl` and also putting back the `\end` that served as an end-delimiter: this `\end` receives the environment name as its argument and is run normally. The D-type code stores the argument found (body of the environment) as a brace group in `\l__cmd_args_tl` and depending on the presence of a prefix `!` we trim spaces or not before adding this braced argument into the saved `\l__cmd_args_tl`. The strange `\begin_` control sequence is there for display purposes only: it has to look like `\begin` in the terminal but not to delimited arguments.

```

963 \cs_new_protected:Npn \__cmd_grab_b:w
964 { \__cmd_grab_b_aux:NNw \cs_set_protected_nopar:Npn \tl_trim_spaces:n }
965 \cs_new_protected:Npn \__cmd_grab_b_long:w
966 { \__cmd_grab_b_aux:NNw \cs_set_protected:Npn \tl_trim_spaces:n }

1007   \__cmd_grab_D_aux:NNnNN #1 #2 {#3} \cs_set_protected:Npn
1008   \__cmd_peek_meaning_remove:NTF
1009 }

```

This is a bit complicated. The idea is that, in order to check for nested optional argument tokens ([...] and so on) the argument needs to be grabbed without removing any braces at all. If this is not done, then cases like [{[]}] fail. So after testing for an optional argument, it is collected piece-wise. Inserting a quark prevents loss of braces, and there is then a test to see if there are nested delimiters to handle.

```

\__cmd_grab_D_aux:NNnNN
\__cmd_grab_D_aux:NNnN
1010 \cs_new_protected:Npn \__cmd_grab_D_aux:NNnNN #1#2#3#4#5
1011 {
1012   \__cmd_grab_D_aux:NNnN #1#2 {#3} #4
1013   #5 #1
1014   { \__cmd_grab_D_call:Nw #1 }
1015   { \__cmd_add_arg:o \c_novalue_tl }
1016 }

```

Inside the “standard” grabber, there is a test to see if the grabbed argument is entirely enclosed by braces. There are a couple of extra factors to allow for: the argument might be entirely empty, and spaces at the start and end of the input must be retained around a brace group. Also notice that a *blank* argument might still contain spaces.

```

1017 \cs_new_protected:Npn \__cmd_grab_D_aux:NNnN #1#2#3#4

```

```

Catching nested optional arguments means more work. The aim here is to collect up each pair of optional tokens without `TEX` helping out, and without counting anything. The code above will already have removed the leading opening token and a closing token, but the wrong one. The aim is then to work through the material grabbed so far and divide it up on each opening token, grabbing a closing token to match (thus working in pairs). Once there are no opening tokens, then there is a second check to see if there are any opening tokens in the second part of the argument (for things like `[] []`). Once everything has been found, the entire collected material is added to the output as a single argument. The only tricky part here is ensuring that any grabbing function that might run away is named after the function currently being parsed and not after `xparse`. That leads to some rather complex nesting! There is also a need to prevent the loss of any braces, hence the insertion and removal of quarks along the way.

`__cmd_grab_D_call:Nw` For D and R-type arguments, to avoid losing any braces, a token needs to be inserted before the argument to be grabbed. If the argument runs away because the closing token is missing then this inserted token shows up in the terminal. Ideally, #1 would therefore be used directly, but that is no good as it will mess up the rest of the grabber. Instead, a copy of #1 with an altered category code is used, as this will look right in the terminal but will not mess up the grabber. The only issue then is that the category code of #1 is unknown. So there is a quick test to ensure that the inserted token can never be matched by the grabber. (This assumes that the open and close delimiters are not the same character with different category codes, but that really should not happen in any sensible document-level syntax.) An exception is when #1 is a control sequence token, in which case the character-token treatment is no good because if hit with `\token_to_str:N` it would add sputios tokens to the argument. In this case a different branch is taken. The token inserted is then the same *<cname>* as #1, but with a space appended, so that the grabber don't see it as another of the same delimiter.

`\l__cmd_v_arg_tl`

```

1254 \tl_new:N \l__cmd_v_arg_tl

```

`__cmd_grab_v:w` The opening delimiter is the first non-space token, and is never read verbatim. This is required by consistency with the case where the preceding argument was optional and absent: then \TeX has already read and tokenized that token when looking for the optional argument. The first thing is thus to check is that this delimiter is a character, and to distinguish the case of a left brace (in that case, `\group_align_safe_end:` is needed to compensate for the begin-group character that was just seen). Then set verbatim catcodes with `__cmd_grab_v_aux_catcodes:`.

The group keep catcode changes local, and `\group_align_safe_begin/end:` allow to use a character with category code 4 (normally `&`) as the delimiter (all commands do `\group_align_safe_begin/end:`, so there's no need to do that again here). It is ended by `__cmd_grab_v_group_end:`, which smuggles the collected argument out of the group.

\__cmd_grab_v_aux_loop_end:

```

Check that the opening delimiter is a character, setup category codes, then start reading tokens one by one, keeping the delimiter as an argument. If the verbatim was not nested, we will be grabbing one character at each step. Unfortunately, it can happen that what follows the verbatim argument is already tokenized. Thus, we check at each step that the next token is indeed a “nice” character, *i.e.*, is not a character with category code 1 (begin-group), 2 (end-group) or 6 (macro parameter), nor the space character, with category code 10 and character code 32, nor a control sequence. The partially built argument is stored in \l__cmd_v_arg_tl. If we ever meet a token which we cannot grab (non-N-type), or which is not a character according to __cmd_grab_v_token_if_char:NTF, then we bail out with __cmd_grab_v_aux_abort:n. Otherwise, we stop at the first character matching the delimiter.

```

If the opening delimiter is a left brace, we keep track of how many left and right braces were encountered so far in \l__cmd_v_nesting_int (the methods used for optional arguments cannot apply here), and stop as soon as it reaches 0.

Some care was needed when removing the opening delimiter, which has already been assigned category code 1: using \peek_meaning_remove:NTF in the __cmd_grab_v_aux:w function would break within alignments. Instead, we first convert that token to a string, and remove the result as a normal undelimited argument.

1405 }
1406 \cs_generate_variant:Nn \__cmd_add_arg:n { V , o , x }

```

(End definition for __cmd_add_arg:n.)

1.9 Grabbing arguments expandably

__cmd_expandable_grab_D:w The first step is to grab the first token or group. The generic grabbers \<function>_ and \<function>_ are just after \q__cmd, we go and find them (and use the long one).

```

\__cmd_expandable_grab_D:NNNwNNn 1407 \cs_new:Npn \__cmd_expandable_grab_D:w #1 \q__cmd #2#3
\__cmd_expandable_grab_D:NNNwNNnnn 1408 { #2 { \__cmd_expandable_grab_D:NNNwNNn #1 \q__cmd #2 #3 } }
\__cmd_expandable_grab_D:Nw
\__cmd_expandable_grab_D:nnNNNwNN

```

We then wish to test whether #7, which we just grabbed, is exactly #2. A preliminary test is whether their string representations coincide, then expand the only grabber function we

have, #1, once: the two strings below are equal if and only if #7 matches #2 exactly.² The preliminary test is needed as #7 could validly contain \par (because a later mandatory argument could be long) and our grabber may be short. If #7 does not match #2, then the optional argument is missing, we use the default -NoValue-, and put back the argument #7 in the input stream.

If it does match, then interesting things need to be done. We will grab the argument piece by piece, with the following pattern:

```

⟨grabber⟩ {⟨tokens⟩}
\q_nil {⟨piece 1⟩} ⟨piece 2⟩ \ERROR \q__cmd
\q_nil ⟨input stream⟩

```

The ⟨grabber⟩ will find an opening delimiter in ⟨piece 2⟩, take the \q__cmd as a second delimiter, and find more material delimited by the closing delimiter in the ⟨input stream⟩. We then move the part before the opening delimiter from ⟨piece 2⟩ to ⟨piece 1⟩, and the material taken from the ⟨input stream⟩ to the ⟨piece 2⟩. Thus, the argument moves gradually from the ⟨input stream⟩ to the ⟨piece 2⟩, then to the ⟨piece 1⟩ when we have made sure to find all opening and closing delimiters. This two-step process ensures that nesting works: the number of opening delimiters minus closing delimiters in ⟨piece 1⟩ is always equal to the number of closing delimiters in ⟨piece 2⟩. We stop grabbing arguments once the ⟨piece 2⟩ contains no opening delimiter any more, hence the balance is reached, and the final argument is ⟨piece 1⟩ ⟨piece 2⟩. The indirection via __cmd_tmp:w allows to insert -NoValue- expanded.

```

1409 \cs_set_protected:Npn \__cmd_tmp:w #1
1410 {
1411   \cs_new:Npn \__cmd_expandable_grab_D:NNNwNNn ##1##2##3##4 \q__cmd ##5##6##7
1412   {
1413     \str_if_eq:nnTF {##2} {##7}
1414     {
1415       \str_if_eq:onTF
1416       { ##1 { } { } ##7 ##2 \q__cmd ##3 }
1417       { { } {##2} { } }
1418     }
1419     { \use_ii:nn }
1420     {
1421       ##1

1423       \q_nil { } ##2 \ERROR \q__cmd \ERROR
1424     }
1425     { ##4 {##1} \q__cmd ##5 ##6 {##7} }
1426   }
1427 }
1428 \exp_args:No \__cmd_tmp:w { \c_novalue_tl }

```

At this stage, #7 is \q_nil {⟨piece 1⟩} ⟨more for piece 1⟩, and we want to concatenate all that, removing \q_nil, and keeping the opening delimiter #2. Simply use \use_ii:nn.

²It is obvious that if #7 matches #2 then the strings are equal. We must check the converse. The right-hand-side of \str_if_eq:onTF does not end with #3, implying that the grabber function took everything as its arguments. The first brace group can only be empty if #7 starts with #2, otherwise the brace group preceding #7 would not vanish. The third brace group is empty, thus the \q__cmd that was used by our grabber #1 must be the one that we inserted (not some token in #7), hence the second brace group contains the end of #7 followed by #2. Since this is #2 on the right-hand-side, and no brace can be lost there, #7 must contain nothing else than its leading #2.

Also, #8 is $\langle remainder\ of\ piece\ 2 \rangle$ \ERROR, and #9 is \ERROR $\langle more\ for\ piece\ 2 \rangle$. We concatenate those, replacing the two \ERROR by the closing delimiter #3.

```

1429 \cs_new:Npn \__cmd_expandable_grab_D:NNNwNNnnn #1#2#3#4 \q__cmd #5#6#7#8#9
1430 {
1431   \exp_args:Nof \__cmd_expandable_grab_D:nnNNNwNN
1432   { \use_ii:nn #7 #2 }
1433   { \__cmd_expandable_grab_D:Nw #3 \exp_stop_f: #8 #9 }
1434   #1#2#3 #4 \q__cmd #5 #6
1435 }
1436 \cs_new:Npn \__cmd_expandable_grab_D:Nw #1#2 \ERROR \ERROR { #2 #1 }

```

Armed with our two new $\langle pieces \rangle$, we are ready to loop. However, we must first see if $\langle piece\ 2 \rangle$ (here #2) contains any opening delimiter #4. Again, we expand #3, this time removing its whole output with \use_none:nnn. The test is similar to \tl_if_in:nnTF. The token list is empty if and only if #2 does not contain the opening delimiter. In that case, we are done, and put the argument (from which we remove a spurious pair of delimiters coming from how we started the loop). Otherwise, we go back to looping with __cmd_expandable_grab_D:NNNwNNnnn. The code to deal with brace stripping is much the same as for the non-expandable case.

```

(End definition for __cmd_expandable_grab_D_alt:w, __cmd_expandable_grab_D_alt:NNwNNn, and __cmd_expandable_grab_D_alt:Nwn.)

__cmd_expandable_grab_E:w We keep track of long/short by placing the appropriate grabber as the third token after \q__cmd; it is eventually removed by the `end:nnw` auxiliary. The `aux:w` auxiliary will be called repeatedly with two arguments: the set of pairs $\langle parser \rangle \langle token \rangle$, and the set of arguments found so far (initially all $\{-NoValue-\}$). At each step, grab what follows in the input stream then call the `loop:nnnNNw` auxiliary to compare it with each possible embellishment in turn. This auxiliary's #1 is what was found in the input, #2 collects $\langle parser \rangle \langle token \rangle$ pairs that did not match, #3 collects the corresponding arguments found previously, #4 and #5 is the current pair, #6 is the remaining pairs, #7 is empty or two \q_nil, and #8 is the current argument. If none of the pairs matched (determined by `\quark_if_nil:Ntf`) then call the `end` auxiliary to stop looking for embellishments, remembering to put what was grabbed in the input back where it belongs, and storing the arguments found just before \q__cmd. If the current argument #8 is not `-NoValue-` or if the input #1 does not match #5 (see `t-type` arguments below for a similar `\str_if_eq:onTF` test) then carry on the loop. Otherwise, we found a new embellishment: grab the corresponding argument in the input using the `find:w` auxiliary. To avoid losing braces around that auxiliary's argument we include a space, which will be eliminated in the next loop through embellishments.

1.11 Access to the argument specification

__cmd_get_arg_spec_error:N Provide an informative error when trying to get the argument specification of a non-xparse command or environment.

```

\__cmd_get_arg_spec_error:n
\__cmd_get_arg_spec_error_aux:n
1687 \cs_new_protected:Npn \__cmd_get_arg_spec_error:N #1
1688 {
1689   \bool_set_false:N \l__cmd_environment_bool

```

```

1690 \tl_set:Nn \l__cmd_fn_tl {#1}
1691 \__cmd_get_arg_spec_error_aux:n { \cs_if_exist:NTF #1 }
1692 }
1693 \cs_new_protected:Npn \__cmd_get_arg_spec_error:n #1
1694 {
1695   \bool_set_true:N \l__cmd_environment_bool
1696   \str_set:Nx \l__cmd_environment_str {#1}
1697   \__cmd_get_arg_spec_error_aux:n
1698     { \cs_if_exist:cTF { \l__cmd_environment_str } }
1699 }
1700 \cs_new_protected:Npn \__cmd_get_arg_spec_error_aux:n #1
1701 {
1702   #1
1703   {
1704     \__kernel_msg_error:nnx { ltcmd } { non-xparse }
1705     { \__cmd_environment_or_command: }
1706   }
1707   {
1708     \__kernel_msg_error:nnx { ltcmd } { unknown }
1709     { \__cmd_environment_or_command: }
1710   }
1711 }

```

(End definition for __cmd_get_arg_spec_error:N, __cmd_get_arg_spec_error:n, and
__cmd_get_arg_spec_error_aux:n.)

__cmd_get_arg_spec:NTF If the command is not an xparse command, complain. If it is, its second “item” is the argument specification.

```

1712 \cs_new_protected:Npn \__cmd_get_arg_spec:NTF #1#2#3
1713 {
1714   \__cmd_cmd_if_xparse:NTF #1
1715   {
1716     \tl_set:Nx \ArgumentSpecification { \tl_item:Nn #1 { 2 } }
1717     #2
1718   }
1719   {#3}
1720 }

```

(End definition for __cmd_get_arg_spec:NTF.)

Rolling forward from 2020-10-01 is tricky because the entire ltcmd module is new, but the user-level commands have the same name, so only these will clash. To work around that, in latexrelease mode we will (temporarily) disable __kernel_chk_if_free_cs:N for this final part of the code, then restore at the end.

```

1721 <latexrelease>\cs_new_eq:NN \__cmd_chk_if_free_cs:N \__kernel_chk_if_free_cs:N
1722 <latexrelease>\cs_gset_eq:NN \__kernel_chk_if_free_cs:N \use_none:n

```

\ArgumentSpecification

```

1723 \tl_new:N \ArgumentSpecification

```

__cmd_get_arg_spec:N Recovering the argument specification is now trivial.

```

\__cmd_get_arg_spec:n
1724 \cs_new_protected:Npn \__cmd_get_arg_spec:N #1
1725 {
1726   \__cmd_get_arg_spec:NTF #1 { }

```

```

1727     { \_cmd_get_arg_spec_error:N #1 }
1728   }
1729 \cs_new_protected:Npn \_cmd_get_arg_spec:n #1
1730 {
1731   \exp_args:Nc \_cmd_get_arg_spec:NTF
1732     { environment~ \tl_to_str:n {#1} }
1733   { }
1734   { \_cmd_get_arg_spec_error:n {#1} }
1735 }

```

(End definition for `_cmd_get_arg_spec:N` and `_cmd_get_arg_spec:n`.)

`_cmd_show_arg_spec:N` Showing the argument specification simply means finding it and then calling the `\tl_show:N` function.
`_cmd_show_arg_spec:n`

```

1736 \cs_new_protected:Npn \_cmd_show_arg_spec:N #1
1737 {
1738   \_cmd_get_arg_spec:NTF #1
1739     { \tl_show:N \ArgumentSpecification }
1740     { \_cmd_get_arg_spec_error:N #1 }
1741 }
1742 \cs_new_protected:Npn \_cmd_show_arg_spec:n #1
1743 {
1744   \exp_args:Nc \_cmd_get_arg_spec:NTF
1745     { environment~ \tl_to_str:n {#1} }
1746     { \tl_show:N \ArgumentSpecification }
1747     { \_cmd_get_arg_spec_error:n {#1} }
1748 }

```

(End definition for `_cmd_show_arg_spec:N` and `_cmd_show_arg_spec:n`.)

1.12 Utilities

`_cmd_check_definable:nNT`
`_cmd_check_definable_aux:nN`

Check that a token list is appropriate as a first argument of `\NewDocumentCommand` and similar functions and otherwise produce an error. First trim whitespace to allow for spaces around the actual command to be defined. If the result has multiple tokens, it is not a valid argument. The single token is a control sequence exactly if its string representation has more than one character (using `\token_to_str:N` rather than `\tl_to_str:n` to avoid problems with macro parameter characters, and setting `\tex_escapechar:D` to prevent it from being non-printable). Finally, check for an active character: this is done by lowercasing the token to fix its character code (arbitrarily to that of `?`) and comparing the result to an active `?`. Both control sequences and active characters are valid arguments, and non-active character tokens are not. In all cases, the group opened to keep assignments local must be closed.

__cmd_token_if_cs:NNTF Based on the definition of __cmd_check_definable_aux:nN above, but only checks for an actual control sequence (*i.e.*, \<anything>). \tex_escapechar:D is temporarily changed to a known value and then it checks if \string#1 contains more than one character: if it does, it's a control sequence. This test differs from \token_if_cs:NNTF for example in \token_if_cs:NNTF \c_group_begin_token {T}{F}, where \token_if_cs:NNTF returns false.

```

1.14 User functions

The user functions are more or less just the internal functions renamed.

`\BooleanFalse` Design-space names for the Boolean values.

`\BooleanTrue` 2131 `\cs_new_eq:NN \BooleanFalse \c_false_bool`
2132 `\cs_new_eq:NN \BooleanTrue \c_true_bool`

(End definition for \BooleanFalse and \BooleanTrue.)

`\NewDocumentCommand` The user macros are pretty simple wrappers around the internal ones. There is however
`\RenewDocumentCommand` a check that the first argument is a single token, possibly surrounded by spaces (hence
`\ProvideDocumentCommand` the strange `\use:nnn`), and is definable.
`\DeclareDocumentCommand`

```
2133 \cs_new_protected:Npn \NewDocumentCommand #1#2#3
2134 {
2135   \__cmd_check_definable:nNT {#1} \NewDocumentCommand
2136   {
2137     \cs_if_exist:NTF #1
2138     {
2139       \__kernel_msg_error:nnxx { ltcmd } { command-already-defined }
2140       { \use:nnn \token_to_str:N #1 { } }
2141       { \token_to_str:N \NewDocumentCommand }
2142     }
2143     { \__cmd_declare_cmd:Nnn #1 {#2} {#3} }
2144   }
2145 }
2146 \cs_new_protected:Npn \RenewDocumentCommand #1#2#3
2147 {
2148   \__cmd_check_definable:nNT {#1} \RenewDocumentCommand
2149   {
2150     \cs_if_exist:NTF #1
2151     { \__cmd_declare_cmd:Nnn #1 {#2} {#3} }
2152     {
2153       \__kernel_msg_error:nnxx { ltcmd } { command-not-yet-defined }
2154       { \use:nnn \token_to_str:N #1 { } }
2155       { \token_to_str:N \RenewDocumentCommand }
2156     }
2157   }
2158 }
2159 \cs_new_protected:Npn \ProvideDocumentCommand #1#2#3
2160 {
2161   \__cmd_check_definable:nNT {#1} \ProvideDocumentCommand
2162   { \cs_if_exist:NF #1 { \__cmd_declare_cmd:Nnn #1 {#2} {#3} } }
2163 }
2164 \cs_new_protected:Npn \DeclareDocumentCommand #1#2#3
2165 {
2166   \__cmd_check_definable:nNT {#1} \DeclareDocumentCommand
2167   { \__cmd_declare_cmd:Nnn #1 {#2} {#3} }
2168 }
```

(End definition for \NewDocumentCommand and others.)

`\NewDocumentEnvironment` Very similar for environments.

`\RenewDocumentEnvironment` 2169 `\cs_new_protected:Npn \NewDocumentEnvironment #1#2#3#4`

`\ProvideDocumentEnvironment`
`\DeclareDocumentEnvironment`

```

2170 {
2171   \cs_if_exist:cTF {#1}
2172   { \__kernel_msg_error:nxx { ltcmd } { environment-already-defined } {#1} }
2173   { \__cmd_declare_env:nnnn {#1} {#2} {#3} {#4} }
2174 }
2175 \cs_new_protected:Npn \RenewDocumentEnvironment #1#2#3#4
2176 {
2177   \cs_if_exist:cTF {#1}
2178   { \__cmd_declare_env:nnnn {#1} {#2} {#3} {#4} }
2179   { \__kernel_msg_error:nxx { ltcmd } { environment-not-yet-defined } {#1} }
2180 }
2181 \cs_new_protected:Npn \ProvideDocumentEnvironment #1#2#3#4
2182 { \cs_if_exist:cF {#1} { \__cmd_declare_env:nnnn {#1} {#2} {#3} {#4} } }
2183 \cs_new_protected:Npn \DeclareDocumentEnvironment #1#2#3#4
2184 { \__cmd_declare_env:nnnn {#1} {#2} {#3} {#4} }

```

(End definition for \NewDocumentEnvironment and others.)

\NewExpandableDocumentCommand
\RenewExpandableDocumentCommand
\ProvideExpandableDocumentCommand
\DeclareExpandableDocumentCommand

The expandable versions are essentially the same as the basic functions. The strange `\use:nnn` is there in case #1 is surrounded with spaces, as can happen with usual document catcodes in `\RenewExpandableDocumentCommand { \! } ...`

```

2185 \cs_new_protected:Npn \NewExpandableDocumentCommand #1#2#3
2186 {
2187   \__cmd_check_definable:nNT {#1} \NewExpandableDocumentCommand
2188   {
2189     \cs_if_exist:NTF #1
2190     {
2191       \__kernel_msg_error:nxxx { ltcmd } { command-already-defined }
2192       { \use:nnn \token_to_str:N #1 { } }
2193       { \token_to_str:N \NewExpandableDocumentCommand }
2194     }
2195     { \__cmd_declare_expandable_cmd:Nnn #1 {#2} {#3} }
2196   }
2197 }
2198 \cs_new_protected:Npn \RenewExpandableDocumentCommand #1#2#3
2199 {
2200   \__cmd_check_definable:nNT {#1} \RenewExpandableDocumentCommand
2201   {
2202     \cs_if_exist:NTF #1
2203     { \__cmd_declare_expandable_cmd:Nnn #1 {#2} {#3} }
2204     {
2205       \__kernel_msg_error:nxxx { ltcmd } { command-not-yet-defined }
2206       { \use:nnn \token_to_str:N #1 { } }
2207       { \token_to_str:N \RenewExpandableDocumentCommand }
2208     }
2209   }
2210 }
2211 \cs_new_protected:Npn \ProvideExpandableDocumentCommand #1#2#3
2212 {
2213   \__cmd_check_definable:nNT {#1} \ProvideExpandableDocumentCommand
2214   {
2215     \cs_if_exist:NF #1
2216     { \__cmd_declare_expandable_cmd:Nnn #1 {#2} {#3} }
2217   }

```

```

2218 }
2219 \cs_new_protected:Npn \DeclareExpandableDocumentCommand #1#2#3
2220 {
2221   \__cmd_check_definable:nNT {#1} \DeclareExpandableDocumentCommand
2222   { \__cmd_declare_expandable_cmd:Nnn #1 {#2} {#3} }
2223 }

```

(End definition for `\NewExpandableDocumentCommand` and others.)

`\IfBooleanT` The logical `<true>` and `<false>` statements are just the normal `\c_true_bool` and `\c_false_bool` so `\bool_if:NNTF` is almost enough. However, this code-level function blows up badly when passed invalid input. We want `\IfBooleanTF` to accept a single (non-space) token equal to `\c_true_bool` or `\c_false_bool`, possibly surrounded by spaces. If the input is blank or multiple items, jump to the error and pick the false branch. If the input, ignoring spaces (we do this by omitting braces in the `\tl_if_single_token:nF` test), is not a single token then jump to the error as well. It is then safe to compare the token to the two booleans, picking the appropriate branch. If neither matches, we jump to the error as well.

```

2224 \cs_new:Npn \IfBooleanTF #1
2225 {
2226   \tl_if_single:nF {#1}
2227   { \prg_break:n { \use:n } }
2228   \tl_if_single_token:nF #1
2229   { \prg_break:n { \use:n } }
2230   \token_if_eq_meaning:NNT #1 \c_true_bool
2231   { \prg_break:n { \use_ii:nnn } }
2232   \token_if_eq_meaning:NNT #1 \c_false_bool
2233   { \prg_break:n { \use_iii:nnn } }
2234   \prg_break:n { \use:n }
2235   \prg_break_point:
2236   {
2237     \__kernel_msg_expandable_error:nnn { ltcmd } { if-boolean } {#1}
2238     \use_ii:nn
2239   }
2240 }
2241 \cs_new:Npn \IfBooleanT #1#2 { \IfBooleanTF {#1} {#2} { } }
2242 \cs_new:Npn \IfBooleanF #1 { \IfBooleanTF {#1} { } }

```

(End definition for `\IfBooleanT`, `\IfBooleanF`, and `\IfBooleanTF`.)

`\IfNoValueT` Simple re-naming.

```

\IfNoValueF 2243 \cs_new_eq:NN \IfNoValueF \tl_if_novalue:nF
\IfNoValueTF 2244 \cs_new_eq:NN \IfNoValueT \tl_if_novalue:nT
2245 \cs_new_eq:NN \IfNoValueTF \tl_if_novalue:nTF

```

(End definition for `\IfNoValueT`, `\IfNoValueF`, and `\IfNoValueTF`.)

`\IfValueT` Inverted logic.

```

\IfValueF 2246 \cs_new:Npn \IfValueF { \tl_if_novalue:nT }
\IfValueTF 2247 \cs_new:Npn \IfValueT { \tl_if_novalue:nF }
2248 \cs_new:Npn \IfValueTF #1#2#3 { \tl_if_novalue:nTF {#1} {#3} {#2} }

```

(End definition for `\IfValueT`, `\IfValueF`, and `\IfValueTF`.)

`\ProcessedArgument` Processed arguments are returned using this name, which is reserved here although the definition will change.

2249 `\tl_new:N \ProcessedArgument`

(End definition for `\ProcessedArgument`.)

`\ReverseBoolean` Simple copies.

`\SplitArgument` 2250 `\cs_new_eq:NN \ReverseBoolean __cmd_bool_reverse:N`

`\SplitList` 2251 `\cs_new_eq:NN \SplitArgument __cmd_split_argument:nnn`

`\TrimSpaces` 2252 `\cs_new_eq:NN \SplitList __cmd_split_list:nn`

2253 `\cs_new_eq:NN \TrimSpaces __cmd_trim_spaces:n`

(End definition for `\ReverseBoolean` and others.)

`\ProcessList` To support `\SplitList`.

2254 `\cs_new_eq:NN \ProcessList \tl_map_function:nN`

(End definition for `\ProcessList`.)

`\GetDocumentCommandArgSpec` More simple mappings, with a check that the argument is a single control sequence or active character.

`\GetDocumentEnvironmentArgSpec`

`\ShowDocumentCommandArgSpec` 2255 `\cs_new_protected:Npn \GetDocumentCommandArgSpec #1`

`\ShowDocumentEnvironmentArgSpec`

2256 {
2257 `__cmd_check_definable:nNT {#1} \GetDocumentCommandArgSpec`
2258 `{ __cmd_get_arg_spec:N #1 }`
2259 }

2260 `\cs_new_eq:NN \GetDocumentEnvironmentArgSpec __cmd_get_arg_spec:n`

2261 `\cs_new_protected:Npn \ShowDocumentCommandArgSpec #1`

2262 {
2263 `__cmd_check_definable:nNT {#1} \ShowDocumentCommandArgSpec`
2264 `{ __cmd_show_arg_spec:N #1 }`
2265 }

2266 `\cs_new_eq:NN \ShowDocumentEnvironmentArgSpec __cmd_show_arg_spec:n`

(End definition for `\GetDocumentCommandArgSpec` and others.)

Finally as promised, restore `__kernel_chk_if_free_cs:N`:

2267 `\latexrelease\cs_gset_eq:NN __kernel_chk_if_free_cs:N __cmd_chk_if_free_cs:N`

2268 `\latexrelease\cs_undefine:N __cmd_chk_if_free_cs:N`

2269 `\ExplSyntaxOff`

2270 `\</2kernel | latexrelease>`

2271 `\latexrelease\EndIncludeInRelease`

2272 `\latexrelease\catcode'\^@=\@latexrelease@catcode@null\relax`

2273 `\latexrelease>`

2274 `\latexrelease\IncludeInRelease{2020/10/01}%`

2275 `\latexrelease\NewDocumentCommand{Document commands}%`

2276 `\latexrelease\@ifundefined{NewDocumentCommand}`

2277 `\latexrelease {%`

2278 `\latexrelease \IfFileExists{xparse.ltx}`

2279 `\latexrelease {\input xparse.ltx }`

2280 `\latexrelease {\@latex@error{LaTeX requires xparse}\@ehd}%`

2281 `\latexrelease }`

2282 `\latexrelease {}`

2283 `\latexrelease\EndIncludeInRelease`

```

2284 <latexrelease>
2285 <latexrelease>\IncludeInRelease{0000/00/00}%
2286 <latexrelease>                {\NewDocumentCommand}{Document commands}%
2287 <latexrelease>
2288 <latexrelease>\EndIncludeInRelease

    We need to stop DocStrip treating @@ in a special way at this point.
2289 <@@= >

```

1 Introduction

Hooks are points in the code of commands or environments where it is possible to add processing code into existing commands. This can be done by different packages that do not know about each other and to allow for hopefully safe processing it is necessary to sort different chunks of code added by different packages into a suitable processing order.

This is done by the packages adding chunks of code (via `\AddToHook`) and labeling their code with some label by default using the package name as a label.

At `\begin{document}` all code for a hook is then sorted according to some rules (given by `\DeclareHookRule`) for fast execution without processing overhead. If the hook code is modified afterwards (or the rules are changed), a new version for fast processing is generated.

Some hooks are used already in the preamble of the document. If that happens then the hook is prepared for execution (and sorted) already at that point.

2 Package writer interface

The hook management system is offered as a set of CamelCase commands for traditional $\text{\LaTeX} 2_{\epsilon}$ packages (and for use in the document preamble if needed) as well as `expl3` commands for modern packages, that use the L3 programming layer of \LaTeX . Behind the scenes, a single set of data structures is accessed so that packages from both worlds can coexist and access hooks in other packages.

2.1 $\text{\LaTeX} 2_{\epsilon}$ interfaces

2.1.1 Declaring hooks and using them in code

With two exceptions, hooks have to be declared before they can be used. The exceptions are hooks in environments (i.e., executed at `\begin` and `\end`) and hooks run when loading files, e.g. before and after a package is loaded, etc. Their hook names depend on the environment or the file name and so declaring them beforehand is difficult.

`\NewHook`**`\NewHook {<hook>}`**

Creates a new `<hook>`. If this is a hook provided as part of a package it is suggested that the `<hook>` name is always structured as follows: `<package-name>/<hook-name>`. If necessary you can further subdivide the name by adding more `/` parts. If a hook name is already taken, an error is raised and the hook is not created.

The `<hook>` can be specified using the dot-syntax to denote the current package name. See section [2.1.3](#).

<code>\NewReversedHook</code>	<code>\NewReversedHook {⟨hook⟩}</code>
-------------------------------	----------------------------------------

Like `\NewHook` declares a new $\langle hook \rangle$. the difference is that the code chunks for this hook are in reverse order by default (those added last are executed first). Any rules for the hook are applied after the default ordering. See sections 2.3 and 2.4 for further details.

The $\langle hook \rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

<code>\NewMirroredHookPair</code>	<code>\NewMirroredHookPair {⟨hook-1⟩} {⟨hook-2⟩}</code>
-----------------------------------	---------------------------------------------------------

A shorthand for `\NewHook{⟨hook-1⟩}\NewReversedHook{⟨hook-2⟩}`.

The $\langle hooks \rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

<code>\UseHook</code>	<code>\UseHook {⟨hook⟩}</code>
-----------------------	--------------------------------

Execute the hook code inside a command or environment.

Before `\begin{document}` the fast execution code for a hook is not set up, so in order to use a hook there it is explicitly initialized first. As that involves assignments using a hook at those times is not 100% the same as using it after `\begin{document}`.

The $\langle hook \rangle$ *cannot* be specified using the dot-syntax. A leading . is treated literally.

<code>\UseOneTimeHook</code>	<code>\UseOneTimeHook {⟨hook⟩}</code>
------------------------------	---------------------------------------

Some hooks are only used (and can be only used) in one place, for example, those in `\begin{document}` or `\end{document}`. Once we have passed that point adding to the hook through a defined $\langle addto-cmd \rangle$ command (e.g., `\AddToHook` or `\AtBeginDocument`, etc.) would have no effect (as would the use of such a command inside the hook code itself). It is therefore customary to redefine $\langle addto-cmd \rangle$ to simply process its argument, i.e., essentially make it behave like `@firstofone`.

`\UseOneTimeHook` does that: it records that the hook has been consumed and any further attempt to add to it will result in executing the code to be added immediately.

FMi: Maybe add an error version as well?

The $\langle hook \rangle$ *cannot* be specified using the dot-syntax. A leading . is treated literally.

2.1.2 Updating code for hooks

\AddToHook	\AddToHook {<hook>}[<label>]{<code>}
-------------------	---------------------------------------------

Adds <code> to the <hook> labeled by <label>. When the optional argument <label> is not provided, the <default label> is used (see section 2.1.3). If **\AddToHook** is used in a package/class, the <default label> is the package/class name, otherwise it is **top-level** (the **top-level** label is treated differently: see section 2.1.4).

If there already exists code under the <label> then the new <code> is appended to the existing one (even if this is a reversed hook). If you want to replace existing code under the <label>, first apply **\RemoveFromHook**.

The hook doesn't have to exist for code to be added to it. However, if it is not declared, then obviously the added <code> will never be executed. This allows for hooks to work regardless of package loading order and enables packages to add to hooks from other packages without worrying whether they are actually used in the current document. See section 2.1.6.

The <hook> and <label> can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

\RemoveFromHook	\RemoveFromHook {<hook>}[<label>]
------------------------	------------------------------------------

Removes any code labeled by <label> from the <hook>. When the optional argument <label> is not provided, the <default label> is used (see section 2.1.3).

If the code for that <label> wasn't yet added to the <hook>, an order is set so that when some code attempts to add that label, the removal order takes action and the code is not added.

If the optional argument is *, then all code chunks are removed. This is rather dangerous as it drops code from other packages one may not know about!

The <hook> and <label> can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

In contrast to the **voids** relationship between two labels in a **\DeclareHookRule** this is a destructive operation as the labeled code is removed from the hook data structure, whereas the relationship setting can be undone by providing a different relationship later.

A useful application for this declaration inside the document body is when one wants to temporarily add code to hooks and later remove it again, e.g.,

```
\AddToHook{env/quote/before}{\small}
\begin{quote}
  A quote set in a smaller typeface
\end{quote}
...
\RemoveFromHook{env/quote/before}
... now back to normal for further quotes
```

Note that you can't cancel the setting with

```
\AddToHook{env/quote/before}{}
```

because that only “adds” a further empty chunk of code to the hook. Adding **\normalsize** would work but that means the hook then contained **\small\normalsize** which means to font size changes for no good reason.

The above is only needed if one wants to typeset several quotes in a smaller typeface. If the hook is only needed once then `\AddToHookNext` is simpler, because it resets itself after one use.

`\AddToHookNext`

`\AddToHookNext {<hook>}{<code>}`

Adds `<code>` to the next invocation of the `<hook>`. The code is executed after the normal hook code has finished and it is executed only once, i.e. it is deleted after it was used.

Using the declaration is a global operation, i.e., the code is not lost, even if the declaration is used inside a group and the next invocation happens after the group. If the declaration is used several times before the hook is executed then all code is executed in the order in which it was declared.³

It is possible to nest declarations using the same hook (or different hooks), e.g.,

`\AddToHookNext{<hook>}{<code-1>\AddToHookNext{<hook>}{<code-2>}}`

will execute `<code-1>` next time the `<hook>` is used and at that point puts `<code-2>` into the `<hook>` so that it gets executed on following time the hook is run.

A hook doesn't have to exist for code to be added to it. This allows for hooks to work regardless of package loading order. See section 2.1.6.

The `<hook>` can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

2.1.3 Hook names and default labels

It is best practice to use `\AddToHook` in packages or classes *without specifying a <label>* because then the package or class name is automatically used, which is helpful if rules are needed, and avoids mistyping the `<label>`.

Using an explicit `<label>` is only necessary in very specific situations, e.g., if you want to add several chunks of code into a single hook and have them placed in different parts of the hook (by providing some rules).

The other case is when you develop a larger package with several sub-packages. In that case you may want to use the same `<label>` throughout the sub-packages in order to avoid that the labels change if you internally reorganize your code.

Except for `\UseHook`, `\UseOneTimeHook`, `\IfHookEmptyTF`, and `\IfHookExistsTF` (and their `expl3` interfaces `\hook_use:n`, `\hook_use_once:n`, `\hook_if_empty:nTF`, and `\hook_if_exist:nTF`), all `<hook>` and `<label>` arguments are processed in the same way: first, spaces are trimmed around the argument, then it is fully expanded until only character tokens remain. If the full expansion of the `<hook>` or `<label>` contains a non-expandable non-character token, a low-level `TeX` error is raised (namely, the `<hook>` is expanded using `TeX`'s `\csname... \endcsname`, as such, Unicode characters are allowed in `<hook>` and `<label>` arguments). The arguments of `\UseHook`, `\UseOneTimeHook`, `\IfHookEmptyTF`, and `\IfHookExistsTF` are processed much in the same way except that spaces are not trimmed around the argument, for better performance.

It is not enforced, but highly recommended that the hooks defined by a package, and the `<labels>` used to add code to other hooks contain the package name to easily identify the source of the code chunk and to prevent clashes. This should be the standard practice, so this hook management code provides a shortcut to refer to the current package in the name of a `<hook>` and in a `<label>`. If the `<hook>` name or the `<label>` consist just of a single dot (`.`), or starts with a dot followed by a slash (`./`) then the dot denotes the `<default>`

³There is no mechanism to reorder such code chunks (or delete them).

label) (usually the current package or class name—see `\SetDefaultHookLabel`). A “.” or “./” anywhere else in a *hook* or in *label* is treated literally and is not replaced.

For example, inside the package `mypackage.sty`, the default label is `mypackage`, so the instructions:

```
\NewHook    {./hook}
\AddToHook {./hook}[.]{code}      % Same as \AddToHook{./hook}{code}
\AddToHook {./hook}[./sub]{code}
\DeclareHookRule{begindocument}{.}{before}{babel}
\AddToHook {file/after/foo.tex}{code}
```

are equivalent to:

```
\NewHook    {mypackage/hook}
\AddToHook {mypackage/hook}[mypackage]{code}
\AddToHook {mypackage/hook}[mypackage/sub]{code}
\DeclareHookRule{begindocument}{mypackage}{before}{babel}
\AddToHook {file/after/foo.tex}{code} % unchanged
```

The *default label* is automatically set equal to the name of the current package or class at the time the package is loaded. If the hook command is used outside of a package, or the current file wasn’t loaded with `\usepackage` or `\documentclass`, then the `top-level` is used as the *default label*. This may have exceptions—see `\PushDefaultHookLabel`.

This syntax is available in all *label* arguments and most *hook* arguments, both in the $\text{\LaTeX} 2_{\epsilon}$ interface, and the $\text{\LaTeX} 3$ interface described in section 2.2.

Note, however, that the replacement of . by the *default label* takes place when the hook command is executed, so actions that are somehow executed after the package ends will have the wrong *default label* if the dot-syntax is used. For that reason, this syntax is not available in `\UseHook` (and `\hook_use:n`) because the hook is most of the time used outside of the package file in which it was defined. This syntax is also not available in the hook conditionals `\IfHookEmptyTF` (and `\hook_if_empty:nTF`) and `\IfHookExistsTF` (and `\hook_if_exist:nTF`) because these conditionals are used in some performance-critical parts of the hook management code, and because they are usually used to refer to other package’s hooks, so the dot-syntax doesn’t make much sense.

In some cases, for example in large packages, one may want to separate it in logical parts, but still use the main package name as *label*, then the *default label* can be set using `\SetDefaultHookLabel` or `\PushDefaultHookLabel.. \PopDefaultHookLabel`.

`\PushDefaultHookLabel`
`\PopDefaultHookLabel`

`\PushDefaultHookLabel {⟨default label⟩}`
`⟨code⟩`
`\PopDefaultHookLabel`

`\PushDefaultHookLabel` sets the current `⟨default label⟩` to be used in `⟨label⟩` arguments, or when replacing a leading “.” (see above). `\PopDefaultHookLabel` reverts the `⟨default label⟩` to its previous value.

Inside a package or class, the `⟨default label⟩` is equal to the package or class name, unless explicitly changed. Everywhere else, the `⟨default label⟩` is `top-level` (see section 2.1.4) unless explicitly changed.

The effect of `\PushDefaultHookLabel` holds until the next `\PopDefaultHookLabel`. `\usepackage` (and `\RequirePackage` and `\documentclass`) internally use

```

\PushDefaultHookLabel{⟨package name⟩}
⟨package code⟩
\PopDefaultHookLabel

```

to set the `⟨default label⟩` for the package or class file. Inside the `⟨package code⟩` the `⟨default label⟩` can also be changed with `\SetDefaultHookLabel`. `\input` and other file input-related commands from the L^AT_EX kernel do not use `\PushDefaultHookLabel`, so code within files loaded by these commands does *not* get a dedicated `⟨label⟩`! (that is, the `⟨default label⟩` is the current active one when the file was loaded.)

Packages that provide their own package-like interfaces (TikZ’s `\usetikzlibrary`, for example) can use `\PushDefaultHookLabel` and `\PopDefaultHookLabel` to set dedicated labels and emulate `\usepackage`-like hook behaviour within those contexts.

The `top-level` label is treated differently, and is reserved to the user document, so it is not allowed to change the `⟨default label⟩` to `top-level`.

`\SetDefaultHookLabel`

`\SetDefaultHookLabel {⟨default label⟩}`

Similarly to `\PushDefaultHookLabel`, sets the current `⟨default label⟩` to be used in `⟨label⟩` arguments, or when replacing a leading “.”. The effect holds until the label is changed again or until the next `\PopDefaultHookLabel`. The difference between `\PushDefaultHookLabel` and `\SetDefaultHookLabel` is that the latter does not save the current `⟨default label⟩`.

This command is useful when a large package is composed of several smaller packages, but all should have the same `⟨label⟩`, so `\SetDefaultHookLabel` can be used at the beginning of each package file to set the correct label.

`\SetDefaultHookLabel` is not allowed in the main document, where the `⟨default label⟩` is `top-level` and there is no `\PopDefaultHookLabel` to end its effect. It is also not allowed to change the `⟨default label⟩` to `top-level`.

2.1.4 The top-level label

The `top-level` label, assigned to code added from the main document, is different from other labels. Code added to hooks (usually `\AtBeginDocument`) in the preamble is almost always to change something defined by a package, so it should go at the very end of the hook.

Therefore, code added in the `top-level` is always executed at the end of the hook, regardless of where it was declared. If the hook is reversed (see `\NewReversedHook`), the `top-level` chunk is executed at the very beginning instead.

Rules regarding `top-level` have no effect: if a user wants to have a specific set of rules for a code chunk, they should use a different label to said code chunk, and provide a rule for that label instead.

The `top-level` label is exclusive for the user, so trying to add code with that label from a package results in an error.

2.1.5 Defining relations between hook code

The default assumption is that code added to hooks by different packages are independent and the order in which they are executed is irrelevant. While this is true in many cases it is obviously false in others.

Before the hook management system was introduced packages had to take elaborate precaution to determine if some other package got loaded as well (before or after) and find some ways to alter its behavior accordingly. In addition it was often the user's responsibility to load packages in the right order so that code added to hooks got added in the right order and some cases even altering the loading order wouldn't resolve the conflicts.

With the new hook management system it is now possible to define rules (i.e., relationships) between code chunks added by different packages and explicitly describe in which order they should be processed.

<code>\DeclareHookRule</code>	<code>\DeclareHookRule {<hook>}{<label1>}{<relation>}{<label2>}</code>
	Defines a relation between <code><label1></code> and <code><label2></code> for a given <code><hook></code> . If <code><hook></code> is <code>??</code> this defines a default relation for all hooks that use the two labels, i.e., that have chunks of code labeled with <code><label1></code> and <code><label2></code> . Rules specific to a given hook take precedence over default rules that use <code>??</code> as the <code><hook></code> .
	Currently, the supported relations are the following:
<code>before</code> or <code><</code>	Code for <code><label1></code> comes before code for <code><label2></code> .
<code>after</code> or <code>></code>	Code for <code><label1></code> comes after code for <code><label2></code> .
<code>incompatible-warning</code>	Only code for either <code><label1></code> or <code><label2></code> can appear for that hook (a way to say that two packages—or parts of them—are incompatible). A warning is raised if both labels appear in the same hook.
<code>incompatible-error</code>	Like <code>incompatible-error</code> but instead of a warning a <code>L^AT_EX</code> error is raised, and the code for both labels are dropped from that hook until the conflict is resolved.
<code>voids</code>	Code for <code><label1></code> overwrites code for <code><label2></code> . More precisely, code for <code><label2></code> is dropped for that hook. This can be used, for example if one package is a superset in functionality of another one and therefore wants to undo code in some hook and replace it with its own version.
<code>unrelated</code>	The order of code for <code><label1></code> and <code><label2></code> is irrelevant. This rule is there to undo an incorrect rule specified earlier.

There can only be a single relation between two labels for a given hook, i.e., a later `\DeclareHookrule` overwrites any previous declaration.

The `<hook>` and `<label>` can be specified using the dot-syntax to denote the current package name. See section [2.1.3](#).

<code>\ClearHookRule</code>	<code>\ClearHookRule{<hook>}{<label1>}{<label2>}</code>
-----------------------------	---------------------------------------------------------------------------

Syntactic sugar for saying that `<label1>` and `<label2>` are unrelated for the given `<hook>`.

<code>\DeclareDefaultHookRule</code>	<code>\DeclareDefaultHookRule{<label1>}{<relation>}{<label2>}</code>
--------------------------------------	----------------------------------------------------------------------------------------

This sets up a relation between `<label1>` and `<label2>` for all hooks unless overwritten by a specific rule for a hook. Useful for cases where one package has a specific relation to some other package, e.g., is `incompatible` or always needs a special ordering `before` or `after`. (Technically it is just a shorthand for using `\DeclareHookRule` with `??` as the hook name.)

Declaring default rules is only supported in the document preamble.⁴

The `<label>` can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

2.1.6 Querying hooks

Simpler data types, like token lists, have three possible states; they can:

- exist and be empty;
- exist and be non-empty; and
- not exist (in which case emptiness doesn't apply);

Hooks are a bit more complicated: they have four possible states. A hook may exist or not, and either way it may or may not be empty. This means that even a hook that doesn't exist may be non-empty.

This seemingly strange state may happen when, for example, package *A* defines hook `A/foo`, and package *B* adds some code to that hook. However, a document may load package *B* before package *A*, or may not load package *A* at all. In both cases some code is added to hook `A/foo` without that hook being defined yet, thus that hook is said to be non-empty, whereas it doesn't exist. Therefore, querying the existence of a hook doesn't imply its emptiness, neither does the other way around.

A hook is said to be empty when no code was added to it, either to its permanent code pool, or to its “next” token list. The hook doesn't need to be declared to have code added to its code pool. A hook is said to exist when it was declared with `\NewHook` or some variant thereof. Generic `file` and `env` hooks are automatically declared when code is added to them.

<code>\IfHookEmptyTF</code> ★	<code>\IfHookEmptyTF {<hook>} {<true code>} {<false code>}</code>
-------------------------------	-------------------------------------------------------------------------------------

Tests if the `<hook>` is empty (*i.e.*, no code was added to it using either `\AddToHook` or `\AddToHookNext`), and branches to either `<true code>` or `<false code>` depending on the result.

The `<hook>` *cannot* be specified using the dot-syntax. A leading `.` is treated literally.

⁴Trying to do so, e.g., via `\DeclareHookRule` with `??` has bad side-effects and is not supported (though not explicitly caught for performance reasons).

<code>\IfHookExistsTF</code> ★	<code>\IfHookExistsTF {<hook>} {<true code>} {<false code>}</code>
--------------------------------	--------------------------------------------------------------------------------------

Tests if the `<hook>` exists (if it was created with either `\NewHook`, `\NewReversedHook`, or `\NewMirroredHookPair`), and branches to either `<true code>` or `<false code>` depending on the result.

The existence of a hook usually doesn't mean much from the viewpoint of code that tries to add/remove code from that hook, since package loading order may vary, thus the creation of hooks is asynchronous to adding and removing code from it, so this test should be used sparingly.

Generic hooks are declared at the time code is added to them, so the result of `\hook_if_exist:n` will change once code is added to said hook (unless the hook was previously declared).

The `<hook>` *cannot* be specified using the dot-syntax. A leading `.` is treated literally.

FMi: Would be helpful if we provide some use cases

2.1.7 Displaying hook code

If one has to adjust the code execution in a hook using a hook rule it is helpful to get some information about the code associated with a hook, its current order and the existing rules.

<code>\ShowHook</code> <code>\LogHook</code>	<code>\ShowHook {<hook>}</code>
-------------------------------------------------	---------------------------------------

Displays information about the `<hook>` such as

- the code chunks (and their labels) added to it,
- any rules set up to order them,
- the computed order in which the chunks are executed,
- any code executed on the next invocation only.

`\LogHook` prints the information to the `.log` file, and `\ShowHook` prints them to the terminal/command window and starts T_EX's prompt (only in `\errorstopmode`) to wait for user action.

The `<hook>` can be specified using the dot-syntax to denote the current package name. See section [2.1.3](#).

Suppose a hook `example-hook` whose output of `\ShowHook{example-hook}` is:

```

1  -> The hook 'example-hook':
2  > Code chunks:
3  >   foo -> [code from package 'foo']
4  >   bar -> [from package 'bar']
5  >   baz -> [package 'baz' is here]
6  > Document-level (top-level) code (executed last):
7  >   -> [code from 'top-level']
8  > Extra code for next invocation:
9  >   -> [one-time code]
10 > Rules:
11 >   foo|baz with relation >

```

```

12 >      baz|bar with default relation <
13 > Execution order (after applying rules):
14 >      baz, foo, bar.

```

In the listing above, lines 3 to 5 show the three code chunks added to the hook and their respective labels in the format

`<label> -> <code>`

Line 7 shows the code chunk added by the user in the main document (labeled `top-level`) in the format

Document-level (`top-level`) code (executed `<first/last>`):
`-> <top-level code>`

This code will be either the first or last code executed by the hook (`last` if the hook is normal, `first` if it is reversed). This chunk is not affected by rules and does not take part in sorting.

Line 9 shows the code chunk for the next execution of the hook in the format

`-> <next-code>`

This code will be used and disappear at the next `\UseHook{example-hook}`, in contrast to the chunks mentioned earlier, which can only be removed from that hook by doing `\RemoveFromHook{<label>}[example-hook]`.

Lines 11 and 12 show the rules declared that affect this hook in the format

`<label-1>|<label-2> with <default?> relation <relation>`

which means that the `<relation>` applies to `<label-1>` and `<label-2>`, in that order, as detailed in `\DeclareHookRule`. If the relation is `default` it means that that rule applies to `<label-1>` and `<label-2>` in *all* hooks, (unless overridden by a non-default relation).

Finally, line 14 lists the labels in the hook after sorting; that is, in the order they will be executed when the hook is used.

2.1.8 Debugging hook code

```

\DebugHooksOn
\DebugHooksOff

```

`\DebugHooksOn`

Turn the debugging of hook code on or off. This displays changes made to the hook data structures. The output is rather coarse and not really intended for normal use.

2.2 L3 programming layer (expl3) interfaces

This is a quick summary of the $\text{\LaTeX}3$ programming interfaces for use with packages written in `expl3`. In contrast to the $\text{\LaTeX}2_{\epsilon}$ interfaces they always use mandatory arguments only, e.g., you always have to specify the `<label>` for a code chunk. We therefore suggest to use the declarations discussed in the previous section even in `expl3` packages, but the choice is yours.

<hr/> <code>\hook_new:n</code>	<code>\hook_new:n {\hook}</code>
<code>\hook_new_reversed:n</code>	<code>\hook_new_reversed:n {\hook}</code>
<hr/> <code>\hook_new_pair:nn</code>	<code>\hook_new_pair:nn {\hook-1} {\hook-2}</code>
<p>Creates a new $\langle hook \rangle$ with normal or reverse ordering of code chunks. <code>\hook_new_pair:nn</code> creates a pair of such hooks with $\{\langle hook-2 \rangle\}$ being a reversed hook. If a hook name is already taken, an error is raised and the hook is not created.</p> <p>The $\langle hook \rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.3.</p>	
<hr/> <code>\hook_use:n</code>	<code>\hook_use:n {\hook}</code>
<p>Executes the $\{\langle hook \rangle\}$ code followed (if set up) by the code for next invocation only, then empties that next invocation code.</p> <p>The $\langle hook \rangle$ <i>cannot</i> be specified using the dot-syntax. A leading . is treated literally.</p>	
<hr/> <code>\hook_use_once:n</code>	<code>\hook_use_once:n {\hook}</code>
<p>Changes the $\{\langle hook \rangle\}$ status so that from now on any addition to the hook code is executed immediately. Then execute any $\{\langle hook \rangle\}$ code already set up.</p> <p>The $\langle hook \rangle$ <i>cannot</i> be specified using the dot-syntax. A leading . is treated literally.</p>	
<hr/> <code>\hook_gput_code:nnn</code>	<code>\hook_gput_code:nnn {\hook} {\label} {\code}</code>
<p>Adds a chunk of $\langle code \rangle$ to the $\langle hook \rangle$ labeled $\langle label \rangle$. If the label already exists the $\langle code \rangle$ is appended to the already existing code.</p> <p>If code is added to an external $\langle hook \rangle$ (of the kernel or another package) then the convention is to use the package name as the $\langle label \rangle$ not some internal module name or some other arbitrary string.</p> <p>The $\langle hook \rangle$ and $\langle label \rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.3.</p>	
<hr/> <code>\hook_gput_next_code:nn</code>	<code>\hook_gput_next_code:nn {\hook} {\code}</code>
<p>Adds a chunk of $\langle code \rangle$ for use only in the next invocation of the $\langle hook \rangle$. Once used it is gone.</p> <p>This is simpler than <code>\hook_gput_code:nnn</code>, the code is simply appended to the hook in the order of declaration at the very end, i.e., after all standard code for the hook got executed.</p> <p>Thus if one needs to undo what the standard does one has to do that as part of $\langle code \rangle$.</p> <p>The $\langle hook \rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.3.</p>	

<hr/> <hr/>	<code>\hook_gremove_code:nn</code>	<code>\hook_gremove_code:nn {<hook>} {<label>}</code>
		Removes any code for <i><hook></i> labeled <i><label></i> . If the code for that <i><label></i> wasn't yet added to the <i><hook></i> , an order is set so that when some code attempts to add that label, the removal order takes action and the code is not added. If the second argument is <code>*</code> , then all code chunks are removed. This is rather dangerous as it drops code from other packages one may not know about, so think twice before using that! The <i><hook></i> and <i><label></i> can be specified using the dot-syntax to denote the current package name. See section 2.1.3.
<hr/> <hr/>	<code>\hook_gset_rule:nnnn</code>	<code>\hook_gset_rule:nnnn {<hook>} {<label1>} {<relation>} {<label2>}</code>
		Relate <i><label1></i> with <i><label2></i> when used in <i><hook></i> . See <code>\DeclareHookRule</code> for the allowed <i><relation></i> s. If <i><hook></i> is <code>??</code> a default rule is specified. The <i><hook></i> and <i><label></i> can be specified using the dot-syntax to denote the current package name. See section 2.1.3. The dot-syntax is parsed in both <i><label></i> arguments, but it usually makes sense to be used in only one of them.
<hr/> <hr/>	<code>\hook_if_empty_p:n</code> <code>*</code> <code>\hook_if_empty:nTF</code> <code>*</code>	<code>\hook_if_empty:nTF {<hook>} {<true code>} {<false code>}</code>
		Tests if the <i><hook></i> is empty (<i>i.e.</i> , no code was added to it using either <code>\AddToHook</code> or <code>\AddToHookNext</code>), and branches to either <i><true code></i> or <i><false code></i> depending on the result. The <i><hook></i> <i>cannot</i> be specified using the dot-syntax. A leading <code>.</code> is treated literally.
<hr/> <hr/>	<code>\hook_if_exist_p:n</code> <code>*</code> <code>\hook_if_exist:nTF</code> <code>*</code>	<code>\hook_if_exist:nTF {<hook>} {<true code>} {<false code>}</code>
		Tests if the <i><hook></i> exists (if it was created with either <code>\NewHook</code> , <code>\NewReversedHook</code> , or <code>\NewMirroredHookPair</code>), and branches to either <i><true code></i> or <i><false code></i> depending on the result. The existence of a hook usually doesn't mean much from the viewpoint of code that tries to add/remove code from that hook, since package loading order may vary, thus the creation of hooks is asynchronous to adding and removing code from it, so this test should be used sparingly. Generic hooks are declared at the time code is added to them, so the result of <code>\hook_if_exist:n</code> will change once code is added to said hook (unless the hook was previously declared). The <i><hook></i> <i>cannot</i> be specified using the dot-syntax. A leading <code>.</code> is treated literally.

<code>\hook_show:n</code>	<code>\hook_show:n {<hook>}</code>
<code>\hook_log:n</code>	

Displays information about the $\langle hook \rangle$ such as

- the code chunks (and their labels) added to it,
- any rules set up to order them,
- the computed order in which the chunks are executed,
- any code executed on the next invocation only.

`\hook_log:n` prints the information to the `.log` file, and `\hook_show:n` prints them to the terminal/command window and starts \TeX 's prompt (only if `\errorstopmode`) to wait for user action.

The $\langle hook \rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

<code>\hook_debug_on:</code>	<code>\hook_debug_on:</code>
<code>\hook_debug_off:</code>	

Turns the debugging of hook code on or off. This displays changes to the hook data.

2.3 On the order of hook code execution

Chunks of code for a $\langle hook \rangle$ under different labels are supposed to be independent if there are no special rules set up that define a relation between the chunks. This means that you can't make assumptions about the order of execution!

Suppose you have the following declarations:

```
\NewHook{myhook}
\AddToHook{myhook}[packageA]{\typeout{A}}
\AddToHook{myhook}[packageB]{\typeout{B}}
\AddToHook{myhook}[packageC]{\typeout{C}}
```

then executing the hook with `\UseHook` will produce the typeout A B C in that order. In other words, the execution order is computed to be `packageA`, `packageB`, `packageC` which you can verify with `\ShowHook{myhook}`:

```
-> The hook 'myhook':
> Code chunks:
>   packageA -> \typeout {A}
>   packageB -> \typeout {B}
>   packageC -> \typeout {C}
> Document-level (top-level) code (executed last):
>   ---
> Extra code for next invocation:
>   ---
> Rules:
>   ---
> Execution order:
>   packageA, packageB, packageC.
```

The reason is that the code chunks are internally saved in a property list and the initial order of such a property list is the order in which key-value pairs got added. However, that is only true if nothing other than adding happens!

Suppose, for example, you want to replace the code chunk for `packageA`, e.g.,

```
\RemoveFromHook{myhook}[packageA]
\AddToHook{myhook}[packageA]{\typeout{A alt}}
```

then your order becomes `packageB`, `packageC`, `packageA` because the label got removed from the property list and then re-added (at its end).

While that may not be too surprising, the execution order is also sometimes altered if you add a redundant rule, e.g. if you specify

```
\DeclareHookRule{myhook}{packageA}{before}{packageB}
```

instead of the previous lines we get

```
-> The hook 'myhook':
> Code chunks:
>   packageA -> \typeout {A}
>   packageB -> \typeout {B}
>   packageC -> \typeout {C}
> Document-level (top-level) code (executed last):
>   ---
> Extra code for next invocation:
>   ---
> Rules:
>   packageB|packageA with relation >
> Execution order (after applying rules):
>   packageA, packageC, packageB.
```

As you can see the code chunks are still in the same order, but in the execution order for the labels `packageB` and `packageC` have swapped places. The reason is that, with the rule there are two orders that satisfy it, and the algorithm for sorting happened to pick a different one compared to the case without rules (where it doesn't run at all as there is nothing to resolve). Incidentally, if we had instead specified the redundant rule

```
\DeclareHookRule{myhook}{packageB}{before}{packageC}
```

the execution order would not have changed.

In summary: it is not possible to rely on the order of execution unless there are rules that partially or fully define the order (in which you can rely on them being fulfilled).

2.4 The use of “reversed” hooks

You may have wondered why you can declare a “reversed” hook with `\NewReversedHook` and what that does exactly.

In short: the execution order of a reversed hook (without any rules!) is exactly reversed to the order you would have gotten for a hook declared with `\NewHook`.

This is helpful if you have a pair of hooks where you expect to see code added that involves grouping, e.g., starting an environment in the first and closing that environment in the second hook. To give a somewhat contrived example⁵, suppose there is a package adding the following:

⁵there are simpler ways to achieve the same effect.

```

\AddToHook{env/quote/before}[package-1]{\begin{itshape}}
\AddToHook{env/quote/after} [package-1]{\end{itshape}}

```

As a result, all quotes will be in italics. Now suppose further that another `package-too` makes the quotes also in blue and therefore adds:

```

\usepackage{color}
\AddToHook{env/quote/before}[package-too]{\begin{color}{blue}}
\AddToHook{env/quote/after} [package-too]{\end{color}}

```

Now if the `env/quote/after` hook would be a normal hook we would get the same execution order in both hooks, namely:

```
package-1, package-too
```

(or vice versa) and as a result, would get:

```

\begin{itshape}\begin{color}{blue} ...
\end{itshape}\end{color}

```

and an error message that `\begin{color}` ended by `\end{itshape}`. With `env/quote/after` declared as a reversed hook the execution order is reversed and so all environments are closed in the correct sequence and `\ShowHook` would give us the following output:

```

-> The hook 'env/quote/after':
> Code chunks:
>   package-1 -> \end {itshape}
>   package-too -> \end {color}
> Document-level (top-level) code (executed first):
>   ---
> Extra code for next invocation:
>   ---
> Rules:
>   ---
> Execution order (after reversal):
>   package-too, package-1.

```

The reversal of the execution order happens before applying any rules, so if you alter the order you will probably have to alter it in both hooks, not just in one, but that depends on the use case.

2.5 Difference between “normal” and “one-time” hooks

When executing a hook a developer has the choice of using either `\UseHook` or `\UseOneTimeHook` (or their `expl3` equivalents `\hook_use:n` and `\hook_use_once:n`). This choice affects how `\AddToHook` is handled after the hook has been executed for the first time.

With normal hooks adding code via `\AddToHook` means that the code chunk is added to the hook data structure and then used each time `\UseHook` is called.

With one-time hooks it this is handled slightly differently: After `\UseOneTimeHook` has been called, any further attempts to add code to the hook via `\AddToHook` will simply execute the `<code>` immediately.

This has some consequences one needs to be aware of:

- If $\langle code \rangle$ is added to a normal hook after the hook was executed and it is never executed again for one or the other reason, then this new $\langle code \rangle$ will never be executed.
- In contrast if that happens with a one-time hook the $\langle code \rangle$ is executed immediately.

In particular this means that construct such as

```
\AddToHook{myhook}
{  $\langle code-1 \rangle$  \AddToHook{myhook}{ $\langle code-2 \rangle$ }  $\langle code-3 \rangle$  }
```

works for one-time hooks⁶ (all three code chunks are executed one after another), but it makes little sense with a normal hook, because with a normal hook the first time `\UseHook{myhook}` is executed it would

- execute $\langle code-1 \rangle$,
- then execute `\AddToHook{myhook}{code-2}` which adds the code chunk $\langle code-2 \rangle$ to the hook for use on the next invocation,
- and finally execute $\langle code-3 \rangle$.

The second time `\UseHook` is called it would execute the above and in addition $\langle code-2 \rangle$ as that was added as a code chunk to the hook in the meantime. So each time the hook is used another copy of $\langle code-2 \rangle$ is added and so that code chunk is executed $\langle \# \text{ of invocations} \rangle - 1$ times.

2.6 Private L^AT_EX kernel hooks

There are a few places where it is absolutely essential for L^AT_EX to function correctly that code is executed in a precisely defined order. Even that could have been implemented with the hook management (by adding various rules to ensure the appropriate ordering with respect to other code added by packages). However, this makes every document unnecessary slow, because there has to be sorting even though the result is predetermined. Furthermore it forces package writers to unnecessarily add such rules if they add further code to the hook (or break L^AT_EX).

For that reason such code is not using the hook management, but instead private kernel commands directly before or after a public hook with the following naming convention: `\@kernel@before@hookname` or `\@kernel@after@hookname`. For example, in `\enddocument` you find

```
\UseHook{enddocument}%
\@kernel@after@enddocument
```

which means first the user/package-accessible `enddocument` hook is executed and then the internal kernel hook. As their name indicates these kernel commands should not be altered by third-party packages, so please refrain from that in the interest of stability and instead use the public hook next to it.⁷

⁶This is sometimes used with `\AtBeginDocument` which is why it is supported.

⁷As with everything in T_EX there is no enforcement of this rule, and by looking at the code it is easy to find out how the kernel adds to them. The main reason of this section is therefore to say “please don’t do that, this is unconfigurable code!”

2.7 Legacy L^AT_EX 2_ε interfaces

L^AT_EX 2_ε offered a small number of hooks together with commands to add to them. They are listed here and are retained for backwards compatibility.

With the new hook management several additional hooks have been added to L^AT_EX and more will follow. See the next section for what is already available.

<code>\AtBeginDocument</code>	<code>\AtBeginDocument [<i>label</i>] {<i>code</i>}</code>
-------------------------------	------------------------------------------------------------

If used without the optional argument *label*, it works essentially like before, i.e., it is adding *code* to the hook `begindocument` (which is executed inside `\begin{document}`). However, all code added this way is labeled with the label `top-level` (see section 2.1.4) if done outside of a package or class or with the package/class name if called inside such a file (see section 2.1.3).

This way one can add further code to the hook using `\AddToHook` or `\AtBeginDocument` using a different label and explicitly order the code chunks as necessary, e.g., run some code before or after another package's code. When using the optional argument the call is equivalent to running `\AddToHook {begindocument} [label] {code}`.

`\AtBeginDocument` is a wrapper around the `begindocument` hook (see section 2.8.2), which is a one-time hook. As such, after the `begindocument` hook is executed at `\begin{document}` any attempt to add *code* to this hook with `\AtBeginDocument` or with `\AddToHook` will cause that *code* to execute immediately instead. See section 2.5 for more on one-time hooks.

For important packages with known order requirement we may over time add rules to the kernel (or to those packages) so that they work regardless of the loading-order in the document.

<code>\AtEndDocument</code>	<code>\AtEndDocument [<i>label</i>] {<i>code</i>}</code>
-----------------------------	----------------------------------------------------------

Like `\AtBeginDocument` but for the `enddocument` hook.

There is also `\AtBeginDvi` which is discussed in conjunction with the shipout hooks.

The few hooks that existed previously in L^AT_EX 2_ε used internally commands such as `@begindocumenthook` and packages sometimes augmented them directly rather than working through `\AtBeginDocument`. For that reason there is currently support for this, that is, if the system detects that such an internal legacy hook command contains code it adds it to the new hook system under the label `legacy` so that it doesn't get lost.

However, over time the remaining cases of direct usage need updating because in one of the future release of L^AT_EX we will turn this legacy support off, as it does unnecessary slow down the processing.

2.8 L^AT_EX 2_ε commands and environments augmented by hooks

intro to be written

2.8.1 Generic hooks for all environments

Every environment *env* has now four associated hooks coming with it:

env/⟨env⟩/before This hook is executed as part of `\begin` as the very first action, in particular prior to starting the environment group. Its scope is therefore not restricted by the environment.

env/⟨env⟩/begin This hook is executed as part of `\begin` directly in front of the code specific to the environment start (e.g., the second argument of `\newenvironment`). Its scope is the environment body.

env/⟨env⟩/end This hook is executed as part of `\end` directly in front of the code specific to the end of the environment (e.g., the third argument of `\newenvironment`).

env/⟨env⟩/after This hook is executed as part of `\end` after the code specific to the environment end and after the environment group has ended. Its scope is therefore not restricted by the environment.

The hook is implemented as a reversed hook so if two packages add code to `env/⟨env⟩/before` and to `env/⟨env⟩/after` they can add surrounding environments and the order of closing them happens in the right sequence.

Generic environment hooks are never one-time hooks even with environments that are supposed to appear only once in a document.⁸ In contrast to other hooks there is also no need to declare them using `\NewHook`.

The hooks are only executed if `\begin{⟨env⟩}` and `\end{⟨env⟩}` is used. If the environment code is executed via low-level calls to `\⟨env⟩` and `\end⟨env⟩` (e.g., to avoid the environment grouping) they are not available. If you want them available in code using this method, you would need to add them yourself, i.e., write something like

```
\UseHook{env/quote/before}\quote
...
\endquote\UseHook{env/quote/after}
```

to add the outer hooks, etc.

`\BeforeBeginEnvironment`

`\BeforeBeginEnvironment [⟨label⟩] {⟨code⟩}`

This declaration adds to the `env/⟨env⟩/before` hook using the `⟨label⟩`. If `⟨label⟩` is not given, the `⟨default label⟩` is used (see section 2.1.3).

`\AtBeginEnvironment`

`\AtBeginEnvironment [⟨label⟩] {⟨code⟩}`

Like `\BeforeBeginEnvironment` but adds to the `env/⟨env⟩/begin` hook.

`\AtEndEnvironment`

`\AtEndEnvironment [⟨label⟩] {⟨code⟩}`

Like `\BeforeBeginEnvironment` but adds to the `env/⟨env⟩/end` hook.

`\AfterEndEnvironment`

`\AfterEndEnvironment [⟨label⟩] {⟨code⟩}`

Like `\BeforeBeginEnvironment` but adds to the `env/⟨env⟩/after` hook.

⁸Thus if one adds code to such hooks after the environment has been processed, it will only be executed if the environment appears again and if that doesn't happen the code will never get executed.

2.8.2 Hooks provided by `\begin{document}`

Until 2020 `\begin{document}` offered exactly one hook that one could add to using `\AtBeginDocument`. Experiences over the years have shown that this single hook in one place was not enough and as part of adding the general hook management system a number of additional hooks have been added at this point. The places for these hooks have been chosen to provide the same support as offered by external packages, such as `etoolbox` and others that augmented `\document` to gain better control.

Supported are now the following hooks (all of them one-time hooks):

`begindocument/before` This hook is executed at the very start of `\document`, one can think of it as a hook for code at the end of the preamble section and this is how it is used by `etoolbox`'s `\AtEndPreamble`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

`begindocument` This hook is added to when using `\AtBeginDocument` and it is executed after the `.aux` file as be read in and most initialization are done, so they can be altered and inspected by the hook code. It is followed by a small number of further initializations that shouldn't be altered and are therefore coming later.

The hook should not be used to add material for typesetting as we are still in \LaTeX 's initialization phase and not in the document body. If such material needs to be added to the document body use the next hook instead.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

`begindocument/end` This hook is executed at the end of the `\document` code in other words at the beginning of the document body. The only command that follows it is `\ignorespaces`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

The generic hooks executed by `\begin` also exist, i.e., `env/document/before` and `env/document/begin`, but with this special environment it is better use the dedicated one-time hooks above.

2.8.3 Hooks provided by `\end{document}`

\LaTeX 2_ε always provided `\AtEndDocument` to add code to the execution of `\end{document}` just in front of the code that is normally executed there. While this was a big improvement over the situation in \LaTeX 2.09 it was not flexible enough for a number of use cases and so packages, such as `etoolbox`, `atveryend` and others patched `\enddocument` to add additional points where code could be hooked into.

Patching using packages is always problematical as leads to conflicts (code availability, ordering of patches, incompatible patches, etc.). For this reason a number of additional hooks have been added to the `\enddocument` code to allow packages to add code in various places in a controlled way without the need for overwriting or patching the core code.

Supported are now the following hooks (all of them one-time hooks):

enddocument The hook associated with `\AtEndDocument`. It is immediately called at the beginning of `\enddocument`.

When this hook is executed there may be still unprocessed material (e.g., floats on the deferlist) and the hook may add further material to be typeset. After it, `\clearpage` is called to ensure that all such material gets typeset. If there is nothing waiting the `\clearpage` has no effect.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/afterlastpage As the name indicates this hook should not receive code that generates material for further pages. It is the right place to do some final housekeeping and possibly write out some information to the `.aux` file (which is still open at this point to receive data). It is also the correct place to set up any testing code to be run when the `.aux` file is re-read in the next step.

After this hook has been executed the `.aux` file is closed for writing and then read back in to do some tests (e.g., looking for missing references or duplicated labels, etc.).

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/afteraux At this point, the `.aux` file has been reprocessed and so this is a possible place for final checks and display of information to the user. However, for the latter you might prefer the next hook, so that your information is displayed after the (possibly longish) list of files if that got requested via `\listfiles`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/info This hook is meant to receive code that write final information messages to the terminal. It follows immediately after the previous hook (so both could have been combined, but then packages adding further code would always need to also supply an explicit rule to specify where it should go).

This hook already contains some code added by the kernel (under the labels `kernel/filelist` and `kernel/warnings`), namely the list of files when `\listfiles` has been used and the warnings for duplicate labels, missing references, font substitutions etc.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/end Finally, this hook is executed just in front of the final call to `\@@end`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).is it even possible to add code after this one?

There is also the hook `shipout/lastpage`. This hook is executed as part of the last `\shipout` in the document to allow package to add final `\special`'s to that page. Where this hook is executed in relation to those from the above list can vary from document to document. Furthermore to determine correctly which of the `\shipouts` is the last one, \LaTeX needs to be run several times, so initially it might get executed on the wrong page. See section 2.8.4 for where to find the details.

It is also possible to use the generic `env/document/end` hook which is executed by `\end`, i.e., just in front of the first hook above. Note however that the other generic `\end` environment hook, i.e., `env/document/after` will never get executed, because by that time `LATEX` has finished the document processing.

2.8.4 Hooks provided `\shipout` operations

There are several hooks and mechanisms added to `LATEX`'s process of generating pages. These are documented in `ltshipout-doc.pdf` or with code in `ltshipout-code.pdf`.

2.8.5 Hooks provided by file loading operations

There are several hooks added to `LATEX`'s process of loading file via its high-level interfaces such as `\input`, `\include`, `\usepackage`, etc. These are documented in `ltfilehook-doc.pdf` or with code in `ltfilehook-code.pdf`.

2.8.6 Hooks provided in NFSS commands

In languages that need to support for more than one script in parallel (and thus several sets of fonts), e.g., Latin and Japanese fonts, NFSS font commands, such as `\sffamily`, need to switch both the Latin family to “Sans Serif” and in addition alter a second set of fonts.

To support this several NFSS have hooks in which such support can be added.

rmfamily After `\rmfamily` has done its initial checks and prepared a any font series update this hook is executed and only afterwards `\selectfont`.

sffamily Like the `rmfamily` hook but for the `\sffamily` command.

ttfamily Like the `rmfamily` hook but for the `\ttfamily` command.

normalfont The `\normalfont` command resets font encoding family series and shape to their document defaults. It then executes this hook and finally calls `\selectfont`.

expand@font@defaults The internal `\expand@font@defaults` command expands and saves the current defaults for the meta families (rm/sf/tt) and the meta series (bf/md). If the NFSS machinery has been augmented, e.g., for Chinese or Japanese fonts, then further defaults may need to be set at this point. This can be done in this hook which is executed at the end of this macro.

bfseries/defaults, bfseries If the `\bfdefault` was explicitly changed by the user its new value is used to set the bf series defaults for the meta families (rm/sf/tt) when `\bfseries` is called. In the `bfseries/defaults` hook further adjustments can be made in this case. This hook is only executed if such a change is detected. In contrast the `bfseries` hook is always executed just before `\selectfont` is called to change to the new series.

mdseries/defaults, mdseries These two hooks are like the previous ones but used in `\mdseries` command.

3 The Implementation

3.1 Loading further extensions

```
1 <@@=hook>
```

At the moment the whole module rolls back in one go, but if we make any modifications in later releases this will then need splitting.

```
2 <*2kernel | latexrelease>
3 <latexrelease> \IncludeInRelease{2020/10/01}%
4 <latexrelease> { \NewHook } { The hook management } %
5 \ExplSyntaxOn
```

3.2 Debugging

`\g__hook_debug_bool` Holds the current debugging state.

```
6 \bool_new:N \g__hook_debug_bool
```

(End definition for \g__hook_debug_bool.)

`\hook_debug_on:` Turns debugging on and off by redefining `__hook_debug:n`.

```
\hook_debug_off:
\__hook_debug:n
\__hook_debug_gset:
7 \cs_new_eq:NN \__hook_debug:n \use_none:n
8 \cs_new_protected:Npn \hook_debug_on:
9 {
10   \bool_gset_true:N \g__hook_debug_bool
11   \__hook_debug_gset:
12 }
13 \cs_new_protected:Npn \hook_debug_off:
14 {
15   \bool_gset_false:N \g__hook_debug_bool
16   \__hook_debug_gset:
17 }
18 \cs_new_protected:Npn \__hook_debug_gset:
19 {
20   \cs_gset_protected:Npx \__hook_debug:n ##1
21   { \bool_if:NT \g__hook_debug_bool {##1} }
22 }
```

(End definition for \hook_debug_on: and others. These functions are documented on page 174.)

3.3 Borrowing from internals of other kernel modules

`__hook_str_compare:nn` Private copy of `__str_if_eq:nn`

```
23 \cs_new_eq:NN \__hook_str_compare:nn \__str_if_eq:nn
```

(End definition for __hook_str_compare:nn.)

3.4 Declarations

`\l__hook_tmpa_bool` Scratch boolean used throughout the package.

```
24 \bool_new:N \l__hook_tmpa_bool
```

(End definition for \l__hook_tmpa_bool.)

<code>\l__hook_return_tl</code>	Scratch variables used throughout the package.
<code>\l__hook_tmpa_tl</code>	25 <code>\tl_new:N \l__hook_return_tl</code>
<code>\l__hook_tmpb_tl</code>	26 <code>\tl_new:N \l__hook_tmpa_tl</code>
	27 <code>\tl_new:N \l__hook_tmpb_tl</code>
	(End definition for <code>\l__hook_return_tl</code> , <code>\l__hook_tmpa_tl</code> , and <code>\l__hook_tmpb_tl</code> .)
<code>\g__hook_all_seq</code>	In a few places we need a list of all hook names ever defined so we keep track if them in this sequence.
	28 <code>\seq_new:N \g__hook_all_seq</code>
	(End definition for <code>\g__hook_all_seq</code> .)
<code>\g__hook_removal_list_prop</code>	A token list to hold delayed removals.
	29 <code>\tl_new:N \g__hook_removal_list_tl</code>
	(End definition for <code>\g__hook_removal_list_prop</code> .)
<code>\l__hook_cur_hook_tl</code>	Stores the name of the hook currently being sorted.
	30 <code>\tl_new:N \l__hook_cur_hook_tl</code>
	(End definition for <code>\l__hook_cur_hook_tl</code> .)
<code>\l__hook_work_prop</code>	A property list holding a copy of the <code>\g__hook_{hook}_code_prop</code> of the hook being sorted to work on, so that changes don't act destructively on the hook data structure.
	31 <code>\prop_new:N \l__hook_work_prop</code>
	(End definition for <code>\l__hook_work_prop</code> .)
<code>\g__hook_execute_immediately_prop</code>	List of hooks that from now on should not longer receive code.
	32 <code>\prop_new:N \g__hook_execute_immediately_prop</code>
	(End definition for <code>\g__hook_execute_immediately_prop</code> .)
<code>\g__hook_used_prop</code>	All hooks that receive code (for use in debugging display).
	33 <code>\prop_new:N \g__hook_used_prop</code>
	(End definition for <code>\g__hook_used_prop</code> .)
<code>\g__hook_hook_curr_name_tl</code>	Default label used for hook commands, and a stack to keep track of packages within packages.
<code>\g__hook_name_stack_seq</code>	34 <code>\tl_new:N \g__hook_hook_curr_name_tl</code>
	35 <code>\seq_new:N \g__hook_name_stack_seq</code>
	(End definition for <code>\g__hook_hook_curr_name_tl</code> and <code>\g__hook_name_stack_seq</code> .)
<code>__hook_tmp:w</code>	Temporary macro for generic usage.
	36 <code>\cs_new_eq:NN __hook_tmp:w ?</code>
	(End definition for <code>__hook_tmp:w</code> .)
<code>\tl_gremove_once:Nx</code>	Some variants of <code>expl3</code> functions.
<code>\tl_show:x</code>	
<code>\tl_log:x</code>	<i>FMi: should be moved to expl3</i>

```

37 \cs_generate_variant:Nn \tl_gremove_once:Nn { Nx }
38 \cs_generate_variant:Nn \tl_show:n { x }
39 \cs_generate_variant:Nn \tl_log:n { x }

```

(End definition for \tl_gremove_once:Nx, \tl_show:x, and \tl_log:x.)

\s__hook_mark Scan mark used for delimited arguments.

```

40 \scan_new:N \s__hook_mark

```

(End definition for \s__hook_mark.)

__hook_tl_set:Nn Private copies of a few expl3 functions. l3debug will only add debugging to the public names, not to these copies, so we don't have to use \debug_suspend: and \debug_resume: everywhere.

__hook_tl_set:Nx Functions like __hook_tl_set:Nn have to be redefined, rather than copied because in expl3 they use __kernel_tl_(g)set:Nx, which is also patched by l3debug.

```

41 \cs_new_protected:Npn \__hook_tl_set:Nn #1#2
42   { \cs_set_nopar:Npx #1 { \__kernel_exp_not:w {#2} } }
43 \cs_new_protected:Npn \__hook_tl_set:Nx #1#2
44   { \cs_set_nopar:Npx #1 {#2} }
45 \cs_generate_variant:Nn \__hook_tl_set:Nn { c }
46 \cs_generate_variant:Nn \__hook_tl_set:Nx { c }

```

(End definition for __hook_tl_set:Nn.)

__hook_tl_gset:Nn Same as above.

```

47 \cs_new_protected:Npn \__hook_tl_gset:Nn #1#2
48   { \cs_gset_nopar:Npx #1 { \__kernel_exp_not:w {#2} } }
49 \cs_new_protected:Npn \__hook_tl_gset:Nx #1#2
50   { \cs_gset_nopar:Npx #1 { \__kernel_exp_not:w \exp_after:wN {#2} } }
51 \cs_new_protected:Npn \__hook_tl_gset:Nn #1#2
52   { \cs_gset_nopar:Npx #1 {#2} }
53 \cs_generate_variant:Nn \__hook_tl_gset:Nn { c }
54 \cs_generate_variant:Nn \__hook_tl_gset:Nx { c }
55 \cs_generate_variant:Nn \__hook_tl_gset:Nx { c }

```

(End definition for __hook_tl_gset:Nn.)

__hook_tl_gput_right:Nn Same as above.

```

56 \cs_new_protected:Npn \__hook_tl_gput_right:Nn #1#2
57   { \__hook_tl_gset:Nx #1 { \__kernel_exp_not:w \exp_after:wN { #1 #2 } } }
58 \cs_generate_variant:Nn \__hook_tl_gput_right:Nn { No, cn }

```

(End definition for __hook_tl_gput_right:Nn.)

__hook_tl_gput_left:Nn Same as above.

```

59 \cs_new_protected:Npn \__hook_tl_gput_left:Nn #1#2
60   {
61     \__hook_tl_gset:Nx #1
62     { \__kernel_exp_not:w {#2} \__kernel_exp_not:w \exp_after:wN {#1} }
63   }
64 \cs_generate_variant:Nn \__hook_tl_gput_left:Nn { No }

```

(End definition for __hook_tl_gput_left:Nn.)

```
\__hook_tl_gset_eq:NN Same as above.
65 \cs_new_eq:NN \__hook_tl_gset_eq:NN \tl_gset_eq:NN

(End definition for \__hook_tl_gset_eq:NN.)
```

```
\__hook_tl_gclear:N Same as above.
\__hook_tl_gclear:c 66 \cs_new_protected:Npn \__hook_tl_gclear:N #1
67 { \__hook_tl_gset_eq:NN #1 \c_empty_tl }
68 \cs_generate_variant:Nn \__hook_tl_gclear:N { c }

(End definition for \__hook_tl_gclear:N.)
```

3.5 Providing new hooks

`\g__hook_..._code_prop` Hooks have a $\langle name \rangle$ and for each hook we have to provide a number of data structures. These are

`__hook_next~...`

`\g__hook_⟨name⟩_code_prop` A property list holding the code for the hook in separate chunks. The keys are by default the package names that add code to the hook, but it is possible for packages to define other keys.

`\g__hook_⟨name⟩_rule_⟨label1⟩|⟨label2⟩_tl` A token list holding the relation between $\langle label1 \rangle$ and $\langle label2 \rangle$ in the $\langle name \rangle$. The $\langle labels \rangle$ are lexically (reverse) sorted to ensure that two labels always point to the same token list. For global rules, the $\langle name \rangle$ is ??.

`__hook_⟨name⟩` The code that is actually executed when the hook is called in the document is stored in this token list. It is constructed from the code chunks applying the information. This token list is named like that so that in case of an error inside the hook, the reported token list in the error is shorter, and to make it simpler to normalize hook names in `__hook_make_name:n`.

`\g__hook_⟨name⟩_reversed_tl` Some hooks are “reversed”. This token list stores a - for such hook so that it can be identified. The - character is used because $\langle reversed \rangle 1$ is +1 for normal hooks and -1 for reversed ones.

`__hook_toplevel_⟨name⟩` This token list stores the code inserted in the hook from the user’s document, in the `top-level` label. This label is special, and doesn’t participate in sorting. Instead, all code is appended to it and executed after (or before, if the hook is reversed) the normal hook code, but before the `next` code chunk.

`__hook_next_⟨name⟩` Finally there is extra code (normally empty) that is used on the next invocation of the hook (and then deleted). This can be used to define some special behavior for a single occasion from within the document. This token list follows the same naming scheme than the main `__hook_⟨name⟩` token list. It is called `__hook_next_⟨name⟩` rather than `__hook_next_⟨name⟩` because otherwise a hook whose name is `next_⟨name⟩` would clash with the next code-token list of the hook called $\langle name \rangle$.

(End definition for `\g__hook_..._code_prop`, `__hook~...`, and `__hook_next~...`)

`\hook_new:n` The `\hook_new:n` declaration declare a new hook and expects the hook $\langle name \rangle$ as its argument, e.g., `\begin{document}`.

```

69 \cs_new_protected:Npn \hook_new:n #1
70 { \__hook_normalize_hook_args:Nn \__hook_new:n {#1} }
71 \cs_new_protected:Npn \__hook_new:n #1
72 {

```

We check for one of the internal data structures and if it already exists we complain.

```

73 \hook_if_exist:nTF {#1}
74 { \msg_error:nnn { hooks } { exists } {#1} }

```

Otherwise we add the hook name to the list of all hooks and allocate the necessary data structures for the new hook.

```

75 {
76 \seq_gput_right:Nn \g__hook_all_seq {#1}

```

This is only used by the actual code of the current hook, so declare it normally:

```

77 \tl_new:c { __hook~#1 }

```

Now ensure that the base data structure for the hook exists:

```

78 \__hook_declare:n {#1}

```

The `\g__hook_<hook>_labels_clist` holds the sorted list of labels (once it got sorted). This is used only for debugging.

```

79 \clist_new:c {g__hook_#1_labels_clist}

```

Some hooks should reverse the default order of code chunks. To signal this we have a token list which is empty for normal hooks and contains a `-` for reversed hooks.

```

80 \tl_new:c { g__hook_#1_reversed_tl }

```

The above is all in L3 convention, but we also provide an interface to legacy $\text{\LaTeX 2}_{\epsilon}$ hooks of the form `\@...hook`, e.g., `\@begin{document}hook`. there have been a few of them and they have been added to using `\g@addto@macro`. If there exists such a macro matching the name of the new hook, i.e., `\@<hook-name>hook` and it is not empty then we add its contents as a code chunk under the label `legacy`.

Warning: this support will vanish in future releases!

```

81 \__hook_include_legacy_code_chunk:n {#1}
82 }
83 }

```

(End definition for `\hook_new:n`. This function is documented on page 172.)

`__hook_declare:n` This function declares the basic data structures for a hook without actually declaring the hook itself. This is needed to allow adding to undeclared hooks. Here it is unnecessary to check whether all variables exist, since all three are declared at the same time (either all of them exist, or none).

```

84 \cs_new_protected:Npn \__hook_declare:n #1
85 {
86 \__hook_if_exist:nF {#1}
87 {
88 \prop_new:c { g__hook_#1_code_prop }
89 \tl_new:c { __hook_toplevel~#1 }
90 \tl_new:c { __hook_next~#1 }
91 }
92 }

```

(End definition for `_hook_declare:n`.)

`\hook_new_reversed:n` Declare a new hook. The default ordering of code chunks is reversed, signaled by setting `_hook_new_reversed:n` the token list to a minus sign.

```

93 \cs_new_protected:Npn \hook_new_reversed:n #1
94 { \_hook_normalize_hook_args:Nn \_hook_new_reversed:n {#1} }
95 \cs_new_protected:Npn \_hook_new_reversed:n #1
96 {
97   \_hook_new:n {#1}

```

If the hook already exists the above will generate an error message, so the next line should be executed (but it is — too bad).

```

98   \tl_gset:cn { g\_hook\_#1\_reversed\_tl } { - }
99 }

```

(End definition for `\hook_new_reversed:n` and `_hook_new_reversed:n`. This function is documented on page 172.)

`\hook_new_pair:nn` A shorthand for declaring a normal and a (matching) reversed hook in one go.

```

100 \cs_new_protected:Npn \hook_new_pair:nn #1#2
101 { \hook_new:n {#1} \hook_new_reversed:n {#2} }

```

(End definition for `\hook_new_pair:nn`. This function is documented on page 172.)

`_hook_include_legacy_code_chunk:n` The L^AT_EX legacy concept for hooks uses with hooks the following naming scheme in the code: `\@...hook`.

If this macro is not empty we add it under the label `legacy` to the current hook and then empty it globally. This way packages or classes directly manipulating commands such as `\@begindocumenthook` still get their hook data added.

Warning: this support will vanish in future releases!

```

102 \cs_new_protected:Npn \_hook_include_legacy_code_chunk:n #1
103 {

```

If the macro doesn't exist (which is the usual case) then nothing needs to be done.

```

104   \tl_if_exist:cT { @#1hook }

```

Of course if the legacy hook exists but is empty, there is no need to add anything under `legacy` the legacy label.

```

105   {
106     \tl_if_empty:cF { @#1hook }
107     {
108       \exp_args:Nnnv \_hook_hook_gput_code_do:nnn {#1}
109       { legacy } { @#1hook }

```

Once added to the hook, we need to clear it otherwise it might get added again later if the hook data gets updated.

```

110       \_hook_tl_gclear:c { @#1hook }
111     }
112   }
113 }

```

(End definition for `_hook_include_legacy_code_chunk:n`.)

3.6 Parsing a label

`__hook_parse_label_default:n` This macro checks if a label was given (not `\c_novalue_tl`), and if so, tries to parse the label looking for a leading `.` to replace by `__hook_currname_or_default:.`

```

114 \cs_new:Npn \__hook_parse_label_default:n #1
115 {
116   \tl_if_novalue:nTF {#1}
117     { \__hook_currname_or_default: }
118     { \tl_trim_spaces_apply:nN {#1} \__hook_parse_dot_label:n }
119 }
```

(End definition for `__hook_parse_label_default:n`.)

`__hook_parse_dot_label:n` Start by checking if the label is empty, which raises an error, and uses the fallback value.
`__hook_parse_dot_label:w` If not, split the label at a `.`, if any, and check if no tokens are before the `.`, or if the
`__hook_parse_dot_label_cleanup:w` only character is a `.`. If these requirements are fulfilled, the leading `.` is replaced with
`__hook_parse_dot_label_aux:w` `__hook_currname_or_default:.` Otherwise the label is returned unchanged.

```

120 \cs_new:Npn \__hook_parse_dot_label:n #1
121 {
122   \tl_if_empty:nTF {#1}
123     {
124       \msg_expandable_error:nn { hooks } { empty-label }
125       \__hook_currname_or_default:
126     }
127     {
128       \str_if_eq:nnTF {#1} { . }
129       { \__hook_currname_or_default: }
130       { \__hook_parse_dot_label:w #1 ./ \s__hook_mark }
131     }
132 }
133 \cs_new:Npn \__hook_parse_dot_label:w #1 ./ #2 \s__hook_mark
134 {
135   \tl_if_empty:nTF {#1}
136     { \__hook_parse_dot_label_aux:w #2 \s__hook_mark }
137     {
138       \tl_if_empty:nTF {#2}
139       { \__hook_make_name:n {#1} }
140       { \__hook_parse_dot_label_cleanup:w #1 ./ #2 \s__hook_mark }
141     }
142 }
143 \cs_new:Npn \__hook_parse_dot_label_cleanup:w #1 ./ \s__hook_mark {#1}
144 \cs_new:Npn \__hook_parse_dot_label_aux:w #1 ./ \s__hook_mark
145 { \__hook_currname_or_default: / \__hook_make_name:n {#1} }
```

(End definition for `__hook_parse_dot_label:n` and others.)

`__hook_currname_or_default:` Uses `\g__hook_hook_curr_name_tl` if it is set, otherwise tries `\@currname`. If neither is set, raises an error and uses the fallback value `label-missing`.

```

146 \cs_new:Npn \__hook_currname_or_default:
147 {
148   \tl_if_empty:nTF \g__hook_hook_curr_name_tl
149   {
150     \tl_if_empty:nTF \@currname
151     {
```

```

152         \msg_expandable_error:nnn { hooks } { should-not-happen }
153         { Empty-default~label. }
154         \__hook_make_name:n { label-missing }
155     }
156     { \@currname }
157 }
158 { \g__hook_hook_curr_name_tl }
159 }

```

(End definition for __hook_currname_or_default:.)

__hook_make_name:n Provides a standard sanitization of a hook’s name. It uses \cs:w to build a control sequence out of the hook name, then uses \cs_to_str:N to get the string representation of that, without the escape character. \cs:w-based expansion is used instead of e-based because Unicode characters don’t behave well inside \expanded. The macro adds the __hook~ prefix to the hook name to reuse the hook’s code token list to build the csname and avoid leaving “public” control sequences defined (as \relax) in TeX’s memory.

```

160 \cs_new:Npn \__hook_make_name:n #1
161 {
162     \exp_after:wN \exp_after:wN \exp_after:wN \__hook_make_name:w
163     \exp_after:wN \token_to_str:N \cs:w \__hook~ #1 \cs_end:
164 }
165 \exp_last_unbraced:NNNno
166 \cs_new:Npn \__hook_make_name:w #1 \tl_to_str:n { \__hook~ } { }

```

(End definition for __hook_make_name:n and __hook_make_name:w.)

_hook_normalize_hook_args:Nn Standard route for normalising hook and label arguments. The main macro does the entire operation within a group so that csnames made by __hook_make_name:n are wiped off before continuing. This means that this function cannot be used for \hook_use:n!

```

167 \cs_new_protected:Npn \__hook_normalize_hook_args_aux:Nn #1 #2
168 {
169     \group_begin:
170     \use:e
171     {
172         \group_end:
173         \exp_not:N #1 #2
174     }
175 }
176 \cs_new_protected:Npn \__hook_normalize_hook_args:Nn #1 #2
177 {
178     \__hook_normalize_hook_args_aux:Nn #1
179     { { \__hook_parse_label_default:n {#2} } }
180 }
181 \cs_new_protected:Npn \__hook_normalize_hook_args:Nnn #1 #2 #3
182 {
183     \__hook_normalize_hook_args_aux:Nn #1
184     {
185         { \__hook_parse_label_default:n {#2} }
186         { \__hook_parse_label_default:n {#3} }
187     }
188 }
189 \cs_new_protected:Npn \__hook_normalize_hook_rule_args:Nnnnn #1 #2 #3 #4 #5

```

```

190 {
191   \__hook_normalize_hook_args_aux:Nn #1
192   {
193     { \__hook_parse_label_default:n {#2} }
194     { \__hook_parse_label_default:n {#3} }
195     { \tl_trim_spaces:n {#4} }
196     { \__hook_parse_label_default:n {#5} }
197   }
198 }

```

(End definition for `__hook_normalize_hook_args:Nn` and others.)

`\hook_gput_code:nnn` With `\hook_gput_code:nnn{<hook>}{<label>}{<code>}` a chunk of `<code>` is added to an existing `<hook>` labeled with `<label>`.

```

\__hook_gput_code:nnn
\__hook_gput_code:nxv
\__hook_hook_gput_code_do:nnn
199 \cs_new_protected:Npn \hook_gput_code:nnn #1 #2
200 { \__hook_normalize_hook_args:Nnn \__hook_gput_code:nnn {#1} {#2} }
201 \cs_new_protected:Npn \__hook_gput_code:nnn #1 #2 #3
202 {

```

First check if the hook was used as a one-time hook:

```

203   \prop_if_in:NnTF \g__hook_execute_immediately_prop {#1}
204   {#3}
205   {

```

Then check if the current `<hook>/<label>` pair was marked for removal, in which case `__hook_unmark_removal:nn` is used to remove that mark (once). This may happen when a package removes code from another package which was not yet loaded: the removal order is stored, and at this stage it is executed by not adding to the hook.

```

206     \__hook_if_marked_removal:nnTF {#1} {#2}
207     { \__hook_unmark_removal:nn {#1} {#2} }
208     {

```

If no removal is queued, we are free to add. Start by checking if the hook exists.

```

209     \hook_if_exist:nTF {#1}

```

If so we simply add (or append) the new code to the property list holding different chunks for the hook. At `\begin{document}` this is then sorted into a token list for fast execution.

```

210     {
211       \__hook_hook_gput_code_do:nnn {#1} {#2} {#3}

```

However, if there is an update within the document we need to alter this execution code which is done by `__hook_update_hook_code:n`. In the preamble this does nothing.

```

212       \__hook_update_hook_code:n {#1}
213     }

```

If the hook does not exist, however, before giving up try to declare it as a generic hook, if its name matches one of the valid patterns.

```

214       { \__hook_try_declaring_generic_hook:nnn {#1} {#2} {#3} }
215     }
216   }
217 }

```

```

218 \cs_generate_variant:Nn \__hook_gput_code:nnn { nxv }

```

This macro will unconditionally add a chunk of code to the given hook.

```

219 \cs_new_protected:Npn \__hook_hook_gput_code_do:nnn #1 #2 #3
220 {

```

However, first some debugging info if debugging is enabled:

```

221 \__hook_debug:nf\iow_term:x{****~ Add~ to~
222 \hook_if_exist:nF {#1} { undeclared~ }
223 hook~ #1~ (#2)
224 \on@line\space <-- \tl_to_str:n{#3}} }

```

Then try to get the code chunk labeled #2 from the hook. If there's code already there, then append #3 to that, otherwise just put #3. If the current label is `top-level`, the code is added to a dedicated token list `__hook_toplevel <hook>` that goes at the end of the hook (or at the beginning, for a reversed hook), just before `__hook_next <hook>`.

```

225 \str_if_eq:nnTF {#2} { top-level }
226 {
227 \str_if_eq:eeTF { top-level } { \__hook_currname_or_default: }
228 {

```

If the hook's basic structure does not exist, we need to declare it with `__hook_declare:n`.

```

229 \__hook_declare:n {#1}
230 \__hook_tl_gput_right:cn { __hook_toplevel~#1 } {#3}
231 }
232 { \msg_error:nnn { hooks } { misused-top-level } {#1} }
233 }
234 {
235 \prop_get:cnNTF { g__hook_#1_code_prop } {#2} \l__hook_return_tl
236 {
237 \prop_gput:cno { g__hook_#1_code_prop } {#2}
238 { \l__hook_return_tl #3 }
239 }
240 { \prop_gput:cnn { g__hook_#1_code_prop } {#2} {#3} }
241 }
242 }

```

(End definition for `\hook_gput_code:nnn`, `__hook_gput_code:nnn`, and `__hook_hook_gput_code_do:nnn`. This function is documented on page 172.)

`__hook_gput_undeclared_hook:nnn`

Often it may happen that a package *A* defines a hook `foo`, but package *B*, that adds code to that hook, is loaded before *A*. In such case we need to add code to the hook before its declared.

```

243 \cs_new_protected:Npn \__hook_gput_undeclared_hook:nnn #1 #2 #3
244 {
245 \__hook_declare:n {#1}
246 \__hook_hook_gput_code_do:nnn {#1} {#2} {#3}
247 }

```

(End definition for `__hook_gput_undeclared_hook:nnn`.)

`__hook_try_declaring_generic_hook:nnn`

These entry-level macros just pass the arguments along to the common `__hook_try_declaring_generic_hook:nNNnn` with the right functions to execute when some action is to be taken.

The wrapper `__hook_try_declaring_generic_hook:nnn` then defers `\hook_gput_code:nnn` if the generic hook was declared, or to `__hook_gput_undeclared_hook:nnn` otherwise (the hook was tested for existence before, so at this point if it isn't generic, it doesn't exist).

The wrapper `__hook_try_declaring_generic_next_hook:nn` for next-execution hooks does the same: it defers the code to `\hook_gput_next_code:nn` if the generic hook was declared, or to `__hook_gput_next_do:nn` otherwise.

```

248 \cs_new_protected:Npn \__hook_try_declaring_generic_hook:nnn #1
249 {
250   \__hook_try_declaring_generic_hook:nNNnn {#1}
251   \hook_gput_code:nnn \__hook_gput_undeclared_hook:nnn
252 }
253 \cs_new_protected:Npn \__hook_try_declaring_generic_next_hook:nn #1
254 {
255   \__hook_try_declaring_generic_hook:nNNnn {#1}
256   \hook_gput_next_code:nn \__hook_gput_next_do:nn
257 }

```

`__hook_try_declaring_generic_hook:nNNnn` now splits the hook name at the first / (if any) and first checks if it is a file-specific hook (they require some normalization) using `__hook_if_file_hook:wTF`. If not then check it is one of a predefined set for generic names. We also split off the second component to see if we have to make a reversed hook. In either case the function returns *(true)* for a generic hook and *(false)* in other cases.

```

\__hook_try_declaring_generic_hook:nNNnn
hook_try_declaring_generic_hook_split:nNNnn
\__hook_try_declaring_generic_hook:wnTF
258 \cs_new_protected:Npn \__hook_try_declaring_generic_hook:nNNnn #1
259 {
260   \__hook_if_file_hook:wTF #1 / / \s__hook_mark
261   {
262     \exp_args:Ne \__hook_try_declaring_generic_hook_split:nNNnn
263     { \exp_args:Ne \__hook_file_hook_normalize:n {#1} }
264   }
265   { \__hook_try_declaring_generic_hook_split:nNNnn {#1} }
266 }
267 \cs_new_protected:Npn \__hook_try_declaring_generic_hook_split:nNNnn #1 #2 #3
268 {
269   \__hook_try_declaring_generic_hook:wnTF #1 / / / \scan_stop: {#1}
270   { #2 }
271   { #3 } {#1}
272 }
273 \prg_new_protected_conditional:Npnn \__hook_try_declaring_generic_hook:wn
274   #1 / #2 / #3 / #4 \scan_stop: #5 { TF }
275 {
276   \tl_if_empty:nTF {#2}
277   { \prg_return_false: }
278   {
279     \prop_if_in:NnTF \c__hook_generics_prop {#1}
280     {
281       \hook_if_exist:nF {#5} { \hook_new:n {#5} }

```

After having declared the hook we check the second component (for file hooks) or the third component for environment hooks) and if it is on the list of components for which we should have declared a reversed hook we alter the hook data structure accordingly.

```

282     \prop_if_in:NnTF \c__hook_generics_reversed_ii_prop {#2}
283     { \tl_gset:cn { g__hook_#5_reversed_tl } { - } }
284     {
285       \prop_if_in:NnTF \c__hook_generics_reversed_iii_prop {#3}
286       { \tl_gset:cn { g__hook_#5_reversed_tl } { - } }
287     }

```

Now that we know that the hook is declared we can add the code to it.

```

288         \prg_return_true:
289     }
290     { \prg_return_false: }
291 }
292 }

```

(End definition for `_hook_try_declaring_generic_hook:nnn` and others.)

`_hook_if_file_hook_p:w` `_hook_if_file_hook:wTF` checks if the argument is a valid file-specific hook (not, for example, `file/before`, but `file/before/foo.tex`). If it is a file-specific hook, then it executes the *⟨true⟩* branch, otherwise *⟨false⟩*.

A file-specific hook is `file/⟨position⟩/⟨name⟩`. If any of these parts don't exist, it is a general file hook or not a file hook at all, so the conditional evaluates to *⟨false⟩*. Otherwise, it checks that the first part is `file` and that the *⟨position⟩* is in the `\c_hook_generics_file_prop`.

A property list is used here to avoid having to worry with catcodes, because `expl3`'s file name parsing turns all characters into catcode-12 tokens, which might differ from hand-input letters.

```

293 \prg_new_conditional:Npnn \_hook_if_file_hook:w
294     #1 / #2 / #3 \s\_hook_mark { TF }
295 {
296     \str_if_eq:nnTF {#1} { file }
297     {
298         \bool_lazy_or:nnTF
299             { \tl_if_empty_p:n {#3} }
300             { \str_if_eq_p:nn {#3} { / } }
301         { \prg_return_false: }
302         {
303             \prop_if_in:NnTF \c\_hook_generics_file_prop {#2}
304                 { \prg_return_true: }
305                 { \prg_return_false: }
306         }
307     }
308     { \prg_return_false: }
309 }

```

(End definition for `_hook_if_file_hook:wTF`.)

`_hook_file_hook_normalize:n` When a file-specific hook is found, before being declared it is lightly normalized by `_hook_file_hook_normalize:n`. The current implementation just replaces two consecutive slashes (`//`) by a single one, to cope with simple cases where the user did something like `\def\input@path{./mypath/}`, in which case a hook would have to be `\AddToHook{file/after/./mypath//file.tex}`.

```

310 \cs_new:Npn \_hook_file_hook_normalize:n #1
311 { \_hook_strip_double_slash:n {#1} }
312 \cs_new:Npn \_hook_strip_double_slash:n #1
313 { \_hook_strip_double_slash:w #1 // \s\_hook_mark }

```

This function is always called after testing if the argument is a file hook with `_hook_if_file_hook:wTF`, so we can assume it has three parts (it is either `file/before/...` or `file/after/...`), so we use `#1/#2/#3 //` instead of just `#1 //` to prevent losing a slash if the file name is empty.

```

314 \cs_new:Npn \__hook_strip_double_slash:w #1/#2/#3 // #4 \s__hook_mark
315 {
316   \tl_if_empty:nTF {#4}
317   { #1/#2/#3 }
318   { \__hook_strip_double_slash:w #1/#2/#3 / #4 \s__hook_mark }
319 }

```

(End definition for __hook_file_hook_normalize:n, __hook_strip_double_slash:n, and __hook_strip_double_slash:w.)

\c__hook_generics_prop Property list holding the generic names. We don't provide any user interface to this as this is meant to be static.

env The generic hooks used in \begin and \end.

file The generic hooks used when loading a file

```

320 \prop_const_from_keyval:Nn \c__hook_generics_prop
321 {env=,file=,package=,class=,include=}

```

(End definition for \c__hook_generics_prop.)

\c__hook_generics_reversed_ii_prop Some of the generic hooks are supposed to use reverse ordering, these are the following
\c__hook_generics_reversed_iii_prop (only the second or third sub-component is checked):

```

\c__hook_generics_file_prop 322 \prop_const_from_keyval:Nn \c__hook_generics_reversed_ii_prop {after=,end=}
323 \prop_const_from_keyval:Nn \c__hook_generics_reversed_iii_prop {after=}
324 \prop_const_from_keyval:Nn \c__hook_generics_file_prop {before=,after=}

```

(End definition for \c__hook_generics_reversed_ii_prop, \c__hook_generics_reversed_iii_prop, and \c__hook_generics_file_prop.)

\hook_gremove_code:nn With \hook_gremove_code:nn{<hook>}{<label>} any code for <hook> stored under <label>
__hook_gremove_code:nn is removed.

```

325 \cs_new_protected:Npn \hook_gremove_code:nn #1 #2
326 { \__hook_normalize_hook_args:Nnn \__hook_gremove_code:nn {#1} {#2} }
327 \cs_new_protected:Npn \__hook_gremove_code:nn #1 #2
328 {

```

First check that the hook code pool exists. \hook_if_exist:nTF isn't used here because it should be possible to remove code from a hook before its defined (see section 2.1.6).

```

329   \__hook_if_exist:nTF {#1}
330   {

```

Then remove the chunk and run __hook_update_hook_code:n so that the execution token list reflects the change if we are after \begin{document}.

If all code is to be removed, clear the code pool \g__hook_<hook>_code_prop, the top-level code __hook_toplevel <hook>, and the next-execution code __hook_next <hook>.

```

331     \str_if_eq:nnTF {#2} {*}
332     {
333       \prop_gclear:c { g__hook_#1_code_prop }
334       \__hook_tl_gclear:c { __hook_toplevel~#1 }
335       \__hook_tl_gclear:c { __hook_next~#1 }
336     }
337     {

```

If the label is `top-level` then clear the token list, as all code there is under the same label. Marked removal is not implemented for `top-level` because it is hard to reliably know that no code was added to `__hook_toplevel` *<hook>* (granted that an empty code could be interpreted as that, but then it differs in behaviour from other labels, in which an empty chunk is still valid for removal). Besides, it doesn't make much (if any) sense for packages to remove `top-level` code. So here the chunk is just cleared unconditionally.

```

338         \str_if_eq:nnTF {#2} { top-level }
339         { \__hook_tl_gclear:c { __hook_toplevel~#1 } }
340         {

```

Otherwise check if the label being removed exists in the code pool. If it does, just call `__hook_gremove_code_do:nn` to do the removal, otherwise mark it to be removed.

```

341         \prop_get:cnNTF { g__hook_#1_code_prop } {#2} \l__hook_return_tl
342         { \__hook_gremove_code_do:nn }
343         { \__hook_mark_removal:nn }
344         {#1} {#2}
345     }
346 }

```

Finally update the code, if the hook exists.

```

347     \hook_if_exist:nT {#1}
348     { \__hook_update_hook_code:n {#1} }
349 }

```

If the code pool for this hook doesn't exist it means that nothing tried to add to it before, so we just queue this removal order for later.

```

350     { \__hook_mark_removal:nn {#1} {#2} }
351 }

```

Remove code for a given label.

```

352 \cs_new_protected:Npn \__hook_gremove_code_do:nn #1 #2
\__hook_gremove_code_do:nn 353 { \prop_gremove:cn { g__hook_#1_code_prop } {#2} }

```

(End definition for `\hook_gremove_code:nn`, `__hook_gremove_code:nn`, and `__hook_gremove_code_do:nn`. This function is documented on page 173.)

`__hook_mark_removal:nn` Marks *<label>* (#2) to be removed from *<hook>* (#1). The number of removals should be fairly small, and `\tl_gremove_once:Nx` is fairly efficient even for longer token lists, so we use a single global token list, rather than one for each hook.

A hand-crafted token list is used here because property lists don't hold repeated items, so multiple usages of `__hook_mark_removal:nn` would be cancelled by a single `__hook_unmark_removal:nn`.

```

354 \cs_new_protected:Npn \__hook_mark_removal:nn #1 #2
355 {
356     \tl_gput_right:Nx \g__hook_removal_list_tl
357     { \__hook_removal_tl:nn {#1} {#2} }
358 }

```

(End definition for `__hook_mark_removal:nn`.)

`__hook_unmark_removal:nn` Unmarks *<label>* (#2) to be removed from *<hook>* (#1). `\tl_gremove_once:Nx` is used rather than `\tl_gremove_all:Nx` so that two additions are needed to cancel two marked removals, rather than only one.

```

359 \cs_new_protected:Npn \__hook_unmark_removal:nn #1 #2

```

```

360 {
361   \tl_gremove_once:Nx \g__hook_removal_list_tl
362   { \__hook_removal_tl:nn {#1} {#2} }
363 }

```

(End definition for __hook_unmark_removal:nn.)

`__hook_if_marked_removal:nnTF` Checks if the `\g__hook_removal_list_tl` contains the current $\langle label \rangle$ ($\#2$) and $\langle hook \rangle$ ($\#1$).

```

364 \prg_new_protected_conditional:Npnn \__hook_if_marked_removal:nn #1 #2 { TF }
365 {
366   \exp_args:NNx \tl_if_in:NnTF \g__hook_removal_list_tl
367   { \__hook_removal_tl:nn {#1} {#2} }
368   { \prg_return_true: } { \prg_return_false: }
369 }

```

(End definition for __hook_if_marked_removal:nnTF.)

`__hook_removal_tl:nn` Builds a token list with $\#1$ and $\#2$ which can only be matched by $\#1$ and $\#2$. The $\&_4$ anchors a removal, so that $\#1$ can't be mistaken by $\#2$ and vice versa, and the two $\$3$ delimit the two arguments

```

370 \cs_new:Npn \__hook_removal_tl:nn #1 #2
371 { & \tl_to_str:n {#2} $ \tl_to_str:n {#1} $ }

```

(End definition for __hook_removal_tl:nn.)

`\g__hook_??_code_prop` Initially these variables simply used an empty “label” name (not two question marks).
`__hook_??` This was a bit unfortunate, because then l3doc complains about `__` in the middle of a command name when trying to typeset the documentation. However using a “normal” name such as `default` has the disadvantage of that being not really distinguishable from a real hook name. I now have settled for `??` which needs some gymnastics to get it into the csname, but since this is used a lot things should be fast, so this is not done with `c` expansion in the code later on.

`__hook~??` isn't used, but it has to be defined to trick the code into thinking that `??` is actually a hook.

```

372 \prop_new:c {g__hook_??_code_prop}
373 \prop_new:c {\__hook~??}

```

Default rules are always given in normal ordering (never in reversed ordering). If such a rule is applied to a reversed hook it behaves as if the rule is reversed (e.g., **after** becomes **before**) because those rules are applied first and then the order is reversed.

```

374 \tl_new:c {g__hook_??_reversed_tl}

```

(End definition for `\g__hook_??_code_prop`, `__hook~??`, and `\g__hook_??_reversed_tl`.)

3.7 Setting rules for hooks code

`\hook_gset_rule:nnnn`
`__hook_gset_rule:nnnn`

FMi: needs docu correction given new implementation

With `\hook_gset_rule:nnnn{ $\langle hook \rangle$ }{ $\langle label1 \rangle$ }{ $\langle relation \rangle$ }{ $\langle label2 \rangle$ }` a relation is defined between the two code labels for the given $\langle hook \rangle$. The special hook `??` stands for any hook describing a default rule.

```

375 \cs_new_protected:Npn \hook_gset_rule:nnnn #1#2#3#4
376 {
377   \__hook_normalize_hook_rule_args:Nnnnn \__hook_gset_rule:nnnn

```

```

378     {#1} {#2} {#3} {#4}
379   }
380   \cs_new_protected:Npn \__hook_gset_rule:nnnn #1#2#3#4
381   {

```

First we ensure the basic data structure of the hook exists:

```

382     \__hook_declare:n {#1}

```

Then we clear any previous relationship between both labels.

```

383     \__hook_rule_gclear:nnn {#1} {#2} {#4}

```

Then we call the function to handle the given rule. Throw an error if the rule is invalid.

```

384     \cs_if_exist_use:cTF { __hook_rule_#3_gset:nnn }
385     {
386         {#1} {#2} {#4}
387         \__hook_update_hook_code:n {#1}
388     }
389     { \msg_error:nnnnnn { hooks } { unknown-rule }
390         {#1} {#2} {#3} {#4}
391     }

```

(End definition for `\hook_gset_rule:nnnn` and `__hook_gset_rule:nnnn`. This function is documented on page 173.)

```

\__hook_rule_before_gset:nnn
\__hook_rule_after_gset:nnn
\__hook_rule_<_gset:nnn
\__hook_rule_>_gset:nnn

```

Then we add the new rule. We need to normalize the rules here to allow for faster processing later. Given a pair of labels l_A and l_B , the rule $l_A > l_B$ is the same as $l_B < l_A$ only presented differently. But by normalizing the forms of the rule to a single representation, say, $l_B < l_A$, reduces the time spent looking for the rules later considerably.

Here we do that normalization by using `\(pdf)strcmp` to lexically sort labels l_A and l_B to a fixed order. This order is then enforced every time these two labels are used together.

Here we use `__hook_label_pair:nn {<hook>} {<lA>} {<lB>}` to build a string $l_B|l_A$ with a fixed order, and use `__hook_label_ordered:nnTF` to apply the correct rule to the pair of labels, depending if it was sorted or not.

```

392   \cs_new_protected:Npn \__hook_rule_before_gset:nnn #1#2#3
393   {
394       \__hook_tl_gset:cx { g__hook_#1_rule_ \__hook_label_pair:nn {#2} {#3} _tl }
395       { \__hook_label_ordered:nnTF {#2} {#3} { < } { > } }
396   }
397   \cs_new_eq:cN { __hook_rule_<_gset:nnn } \__hook_rule_before_gset:nnn
398   \cs_new_protected:Npn \__hook_rule_after_gset:nnn #1#2#3
399   {
400       \__hook_tl_gset:cx { g__hook_#1_rule_ \__hook_label_pair:nn {#3} {#2} _tl }
401       { \__hook_label_ordered:nnTF {#3} {#2} { < } { > } }
402   }
403   \cs_new_eq:cN { __hook_rule_>_gset:nnn } \__hook_rule_after_gset:nnn

```

(End definition for `__hook_rule_before_gset:nnn` and others.)

```

\__hook_rule_voids_gset:nnn

```

This rule removes (clears, actually) the code from label #3 if label #2 is in the hook #1.

```

404   \cs_new_protected:Npn \__hook_rule_voids_gset:nnn #1#2#3
405   {
406       \__hook_tl_gset:cx { g__hook_#1_rule_ \__hook_label_pair:nn {#2} {#3} _tl }
407       { \__hook_label_ordered:nnTF {#2} {#3} { -> } { <- } }
408   }

```

(End definition for `_hook_rule_voids_gset:nnn`.)

`_hook_rule_incompatible-error_gset:nnn` These relations make an error/warning if labels #2 and #3 appear together in hook #1.
`_hook_rule_incompatible-warning_gset:nnn` 409 `\cs_new_protected:cpn { _hook_rule_incompatible-error_gset:nnn } #1#2#3`
410 `{ _hook_tl_gset:cn { g_hook_#1_rule_ _hook_label_pair:nn {#2} {#3} _tl }`
411 `{ xE } }`
412 `\cs_new_protected:cpn { _hook_rule_incompatible-warning_gset:nnn } #1#2#3`
413 `{ _hook_tl_gset:cn { g_hook_#1_rule_ _hook_label_pair:nn {#2} {#3} _tl }`
414 `{ xW } }`

(End definition for `_hook_rule_incompatible-error_gset:nnn` and
`_hook_rule_incompatible-warning_gset:nnn`.)

`_hook_rule_unrelated_gset:nnn` Undo a setting. `_hook_rule_unrelated_gset:nnn` doesn't need to do anything, since
`_hook_rule_gclear:nnn` we use `_hook_rule_gclear:nnn` before setting any rule.

415 `\cs_new_protected:Npn _hook_rule_unrelated_gset:nnn #1#2#3 { }`
416 `\cs_new_protected:Npn _hook_rule_gclear:nnn #1#2#3`
417 `{ \cs_undefine:c { g_hook_#1_rule_ _hook_label_pair:nn {#2} {#3} _tl } }`

(End definition for `_hook_rule_unrelated_gset:nnn` and `_hook_rule_gclear:nnn`.)

`_hook_label_pair:nn` Ensure that the lexically greater label comes first.

418 `\cs_new:Npn _hook_label_pair:nn #1#2`
419 `{`
420 `\if_case:w _hook_str_compare:nn {#1} {#2} \exp_stop_f:`
421 `#1 | #1 % 0`
422 `\or: #1 | #2 % +1`
423 `\else: #2 | #1 % -1`
424 `\fi:`
425 `}`

(End definition for `_hook_label_pair:nn`.)

`_hook_label_ordered_p:nn` Check that labels #1 and #2 are in the correct order (as returned by `_hook_label_-`
`_hook_label_ordered:nnTF` `pair:nn`) and if so return true, else return false.

426 `\prg_new_conditional:Npnn _hook_label_ordered:nn #1#2 { TF }`
427 `{`
428 `\if_int_compare:w _hook_str_compare:nn {#1} {#2} > 0 \exp_stop_f:`
429 `\prg_return_true:`
430 `\else`
431 `\prg_return_false:`
432 `\fi:`
433 `}`

(End definition for `_hook_label_ordered:nnTF`.)

`_hook_if_label_case:nnnnn` To avoid doing the string comparison twice in `_hook_initialize_single:NNn` (once
with `\str_if_eq:nn` and again with `_hook_label_ordered:nn`), we use a three-way
branching macro that will compare #1 and #2 and expand to `\use_i:nnn` if they are
equal, `\use_ii:nn` if #1 is lexically greater, and `\use_iii:nn` otherwise.

434 `\cs_new:Npn _hook_if_label_case:nnnnn #1#2`
435 `{`
436 `\cs:w use_`
437 `\if_case:w _hook_str_compare:nn {#1} {#2}`

```

438         i \or: ii \else: iii \fi: :nnn
439     \cs_end:
440 }

```

(End definition for _hook_if_label_case:nnnnn.)

_hook_update_hook_code:n Before \begin{document} this does nothing, in the body it reinitializes the hook code using the altered data.

```

441 \cs_new_eq:NN \_hook_update_hook_code:n \use_none:n

```

(End definition for _hook_update_hook_code:n.)

_hook_initialize_all: Initialize all known hooks (at \begin{document}), i.e., update the fast execution token lists to hold the necessary code in the right order.

```

442 \cs_new_protected:Npn \_hook_initialize_all: {

```

First we change _hook_update_hook_code:n which so far was a no-op to now initialize one hook. This way any later updates to the hook will run that code and also update the execution token list.

```

443   \cs_gset_eq:NN \_hook_update_hook_code:n \_hook_initialize_hook_code:n

```

Now we loop over all hooks that have been defined and update each of them.

```

444   \_hook_debug:n { \prop_gc_clear:N \g__hook_used_prop }
445   \seq_map_inline:Nn \g__hook_all_seq
446   {
447     \_hook_update_hook_code:n {##1}
448   }

```

If we are debugging we show results hook by hook for all hooks that have data.

```

449   \_hook_debug:n
450   { \iow_term:x{^^JAll~ initialized~ (non-empty)~ hooks:}
451     \prop_map_inline:Nn \g__hook_used_prop
452     { \iow_term:x{^^J~ ##1~ ->~
453       \exp_not:v {\_hook~##1}~ }
454     }
455   }

```

After all hooks are initialized we change the “use” to just call the hook code and not initialize it (as it was done in the preamble.

```

456   \cs_gset_eq:NN \hook_use:n \_hook_use_initialized:n
457   \cs_gset_eq:NN \_hook_preamble_hook:n \use_none:n
458 }

```

(End definition for _hook_initialize_all:.)

_hook_initialize_hook_code:n Initializing or reinitializing the fast execution hook code. In the preamble this is selectively done in case a hook gets used and at \begin{document} this is done for all hooks and afterwards only if the hook code changes.

```

459 \cs_new_protected:Npn \_hook_initialize_hook_code:n #1
460 {
461   \_hook_debug:n{ \iow_term:x{^^JUpdate~ code~ for~ hook~
462     '##1' \on@line :^^J} }

```

This does the sorting and the updates. First thing we do is to check if a legacy hook macro exists and if so we add it to the hook under the label `legacy`. This might make the hook non-empty so we have to do this before the then following test.

```

463   \_hook_include_legacy_code_chunk:n {##1}

```

If there aren't any code chunks for the current hook, there is no point in even starting the sorting routine so we make a quick test for that and in that case just update `__hook <hook>` to hold the top-level and next code chunks. If there are code chunks we call `__hook_initialize_single:NNn` and pass to it ready made csnames as they are needed several times inside. This way we save a bit on processing time if we do that up front.

```

464 \hook_if_exist:nT {#1}
465 {
466   \prop_if_empty:cTF {g__hook_#1_code_prop}
467   {
468     \__hook_tl_gset:co { __hook~#1 }
469     {
470       \cs:w __hook_toplevel~#1 \exp_after:wN \cs_end:
471       \cs:w __hook_next~#1 \cs_end:
472     }
473   }
474   {

```

By default the algorithm sorts the code chunks and then saves the result in a token list for fast execution by adding the code one after another using `\tl_gput_right:NV`. When we sort code for a reversed hook, all we have to do is to add the code chunks in the opposite order into the token list. So all we have to do in preparation is to change two definitions used later on.

```

475 \__hook_if_reversed:nTF {#1}
476 { \cs_set_eq:NN \__hook_tl_gput:Nn \__hook_tl_gput_left:Nn
477   \cs_set_eq:NN \__hook_clist_gput:NV \clist_gput_left:NV }
478 { \cs_set_eq:NN \__hook_tl_gput:Nn \__hook_tl_gput_right:Nn
479   \cs_set_eq:NN \__hook_clist_gput:NV \clist_gput_right:NV }

```

When sorting, some relations (namely voids) need to act destructively on the code property lists to remove code that shouldn't appear in the sorted hook token list, so we temporarily save the old code property list so that it can be restored later.

```

480 \prop_set_eq:Nc \l__hook_work_prop { g__hook_#1_code_prop }
481 \__hook_initialize_single:ccn
482 { __hook~#1 } { g__hook_#1_labels_clist } {#1}

```

For debug display we want to keep track of those hooks that actually got code added to them, so we record that in plist. We use a plist to ensure that we record each hook name only once, i.e., we are only interested in storing the keys and the value is arbitrary.

```

483 \__hook_debug:n{ \exp_args:NNx \prop_gput:Nnn
484                 \g__hook_used_prop {#1}{ } }
485 }
486 }
487 }

```

(End definition for `__hook_initialize_hook_code:n`.)

`__hook_tl_csname:n` It is faster to pass a single token and expand it when necessary than to pass a bunch of
`__hook_seq_csname:n` character tokens around.

FMi: note to myself: verify

```

488 \cs_new:Npn \__hook_tl_csname:n #1 { l__hook_label_#1_tl }
489 \cs_new:Npn \__hook_seq_csname:n #1 { l__hook_label_#1_seq }

```

(End definition for `_hook_tl_csname:n` and `_hook_seq_csname:n`.)

`\l_hook_labels_seq` For the sorting I am basically implementing Knuth's algorithm for topological sorting as
`\l_hook_labels_int` given in TAOCP volume 1 pages 263–266. For this algorithm we need a number of local
`\l_hook_front_tl` variables:
`\l_hook_rear_tl`
`\l_hook_label_0_tl`

- List of labels used in the current hook to label code chunks:

490 `\seq_new:N \l_hook_labels_seq`

- Number of labels used in the current hook. In Knuth's algorithm this is called N :

491 `\int_new:N \l_hook_labels_int`

- The sorted code list to be build is managed using two pointers one to the front of the queue and one to the rear. We model this using token list pointers. Knuth calls them F and R :

492 `\tl_new:N \l_hook_front_tl`

493 `\tl_new:N \l_hook_rear_tl`

- The data for the start of the queue is kept in this token list, it corresponds to what Don calls `QLINK[0]` but since we aren't manipulating individual words in memory it is slightly differently done:

494 `\tl_new:c { _hook_tl_csname:n { 0 } }`

(End definition for `\l_hook_labels_seq` and others.)

`_hook_initialize_single:NNn` `_hook_initialize_single:NNn` implements the sorting of the code chunks for a
`_hook_initialize_single:ccn` hook and saves the result in the token list for fast execution (#4). The arguments are $\langle \textit{hook-code-plist} \rangle$, $\langle \textit{hook-code-tl} \rangle$, $\langle \textit{hook-top-level-code-tl} \rangle$, $\langle \textit{hook-next-code-tl} \rangle$, $\langle \textit{hook-ordered-labels-clist} \rangle$ and $\langle \textit{hook-name} \rangle$ (the latter is only used for debugging—the $\langle \textit{hook-rule-plist} \rangle$ is accessed using the $\langle \textit{hook-name} \rangle$).

The additional complexity compared to Don's algorithm is that we do not use simple positive integers but have arbitrary alphanumeric labels. As usual Don's data structures are chosen in a way that one can omit a lot of tests and I have mimicked that as far as possible. The result is a restriction I do not test for at the moment: a label can't be equal to the number 0!

FMi: Needs checking for, just in case

495 `\cs_new_protected:Npn _hook_initialize_single:NNn #1#2#3`
496 `{`

Step T1: Initialize the data structure ...

497 `\seq_clear:N \l_hook_labels_seq`

498 `\int_zero:N \l_hook_labels_int`

Store the name of the hook:

499 `\tl_set:Nn \l_hook_cur_hook_tl {#3}`

We loop over the property list holding the code and record all labels listed there. Only rules for those labels are of interest to us. While we are at it we count them (which gives us the N in Knuth's algorithm. The prefix `label_` is added to the variables to ensure that labels named `front`, `rear`, `labels`, or `return` don't interact with our code.

```

500 \prop_map_inline:Nn \l__hook_work_prop
501 {
502   \int_incr:N \l__hook_labels_int
503   \seq_put_right:Nn \l__hook_labels_seq {##1}
504   \__hook_tl_set:cn { \__hook_tl_csname:n {##1} } { 0 }
505   \seq_clear_new:c { \__hook_seq_csname:n {##1} }
506 }

```

Steps T2 and T3: Sort the relevant rules into the data structure...

This loop constitutes a square matrix of the labels in `\l__hook_work_prop` in the vertical and the horizontal directions. However since the rule $l_A\langle rel \rangle l_B$ is the same as $l_B\langle rel \rangle^{-1} l_A$ we can cut the loop short at the diagonal of the matrix (*i.e.*, when both labels are equal), saving a good amount of time. The way the rules were set up (see the implementation of `__hook_rule_before_gset:nnn` above) ensures that we have no rule in the ignored side of the matrix, and all rules are seen. The rules are applied in `__hook_apply_label_pair:nnn`, which takes the properly-ordered pair of labels as argument.

```

507 \prop_map_inline:Nn \l__hook_work_prop
508 {
509   \prop_map_inline:Nn \l__hook_work_prop
510   {
511     \__hook_if_label_case:nnnnn {##1} {####1}
512     { \prop_map_break: }
513     { \__hook_apply_label_pair:nnn {##1} {####1} }
514     { \__hook_apply_label_pair:nnn {####1} {##1} }
515     {#3}
516   }
517 }

```

Take a breath and take a look at the data structures that have been set up:

```

518 \__hook_debug:n { \__hook_debug_label_data:N \l__hook_work_prop }

```

Step T4:

```

519 \tl_set:Nn \l__hook_rear_tl { 0 }
520 \tl_set:cn { \__hook_tl_csname:n { 0 } } { 0 }
521 \seq_map_inline:Nn \l__hook_labels_seq
522 {
523   \int_compare:nNnT { \cs:w \__hook_tl_csname:n {##1} \cs_end: } = 0
524   {
525     \tl_set:cn { \__hook_tl_csname:n { \l__hook_rear_tl } } {##1}
526     \tl_set:Nn \l__hook_rear_tl {##1}
527   }
528 }
529 \tl_set_eq:Nc \l__hook_front_tl { \__hook_tl_csname:n { 0 } }
530 \__hook_tl_gclear:N #1
531 \clist_gclear:N #2

```

The whole loop combines steps T5–T7:

```

532 \bool_while_do:nn { ! \str_if_eq_p:Vn \l__hook_front_tl { 0 } }
533 {

```

This part is step T5:

```

534      \int_decr:N \l__hook_labels_int
535      \prop_get:NVN \l__hook_work_prop \l__hook_front_tl \l__hook_return_tl
536      \exp_args:NNV \__hook_tl_gput:Nn #1 \l__hook_return_tl

537      \__hook_clist_gput:NV #2 \l__hook_front_tl
538      \__hook_debug:n{ \iow_term:x{Handled~ code~ for~ \l__hook_front_tl} }

```

This is step T6 except that we don't use a pointer P to move through the successors, but instead use ##1 of the mapping function.

```

539      \seq_map_inline:cn { \__hook_seq_csname:n { \l__hook_front_tl } }
540      {
541        \tl_set:cx { \__hook_tl_csname:n {##1} }
542        { \int_eval:n
543          { \cs:w \__hook_tl_csname:n {##1} \cs_end: - 1 }
544        }
545        \int_compare:nNnT
546        { \cs:w \__hook_tl_csname:n {##1} \cs_end: } = 0
547        {
548          \tl_set:cn { \__hook_tl_csname:n { \l__hook_rear_tl } } {##1}
549          \tl_set:Nn \l__hook_rear_tl {##1}
550        }
551      }

```

and step T7:

```

552      \tl_set_eq:Nc \l__hook_front_tl
553      { \__hook_tl_csname:n { \l__hook_front_tl } }

```

This is step T8: If we haven't moved the code for all labels (i.e., if `\l__hook_labels_int` is still greater than zero) we have a loop and our partial order can't be flattened out.

```

554    }
555    \int_compare:nNnF \l__hook_labels_int = 0
556    {
557      \iow_term:x{=====}
558      \iow_term:x{Error:~ label~ rules~ are~ incompatible:}

```

This is not really the information one needs in the error case but will do for now ...

FMi: fix

```

559      \__hook_debug_label_data:N \l__hook_work_prop
560      \iow_term:x{=====}
561    }

```

After we have added all hook code to #1 we finish it off with adding extra code for the `top-level` (#2) and for one time execution (#3). These should normally be empty. The `top-level` code is added with `__hook_tl_gput:Nn` as that might change for a reversed hook (then `top-level` is the very first code chunk added). The `next` code is always added last.

```

562      \exp_args:NNo \__hook_tl_gput:Nn #1 { \cs:w __hook_toplevel~#3 \cs_end: }
563      \__hook_tl_gput_right:No #1 { \cs:w __hook_next~#3 \cs_end: }
564    }

565    \cs_generate_variant:Nn \__hook_initialize_single:NNn { cc }

```

(End definition for `__hook_initialize_single:NNn`.)

`_hook_tl_gput:Nn` These append either on the right (normal hook) or on the left (reversed hook). This is
`_hook_clist_gput:NV` setup up in `_hook_initialize_hook_code:n`, elsewhere their behavior is undefined.

```
566 \cs_new:Npn \_hook_tl_gput:Nn { \ERROR }
567 \cs_new:Npn \_hook_clist_gput:NV { \ERROR }
```

(End definition for `_hook_tl_gput:Nn` and `_hook_clist_gput:NV`.)

`_hook_apply_label_pair:nnn` This is the payload of steps T2 and T3 executed in the loop described above. This macro
`_hook_label_if_exist_apply:nnnF` assumes #1 and #2 are ordered, which means that any rule pertaining the pair #1 and #2
is `\g__hook_<hook>_rule_#1|#2_tl`, and not `\g__hook_<hook>_rule_#2|#1_tl`. This
also saves a great deal of time since we only need to check the order of the labels once.

The arguments here are `<label1>`, `<label2>`, `<hook>`, and `<hook-code-plist>`. We are
about to apply the next rule and enter it into the data structure. `_hook_apply_-
label_pair:nnn` will just call `_hook_label_if_exist_apply:nnnF` for the `<hook>`,
and if no rule is found, also try the `<hook>` name ?? denoting a default hook rule.

`_hook_label_if_exist_apply:nnnF` will check if the rule exists for the given
hook, and if so call `_hook_apply_rule:nnn`.

```
568 \cs_new_protected:Npn \_hook_apply_label_pair:nnn #1#2#3
569 {
```

Extra complication: as we use default rules and local hook specific rules we first have to
check if there is a local rule and if that exist use it. Otherwise check if there is a default
rule and use that.

```
570 \_hook_label_if_exist_apply:nnnF {#1} {#2} {#3}
571 {
```

If there is no hook-specific rule we check for a default one and use that if it exists.

```
572 \_hook_label_if_exist_apply:nnnF {#1} {#2} { ?? } { }
573 }
574 }
575 \cs_new_protected:Npn \_hook_label_if_exist_apply:nnnF #1#2#3
576 {
577 \if_cs_exist:w g__hook_ #3 _rule_ #1 | #2 _tl \cs_end:
```

What to do precisely depends on the type of rule we have encountered. If it is a **before**
rule it will be handled by the algorithm but other types need to be managed differently.
All this is done in `_hook_apply_rule:nnnN`.

```
578 \_hook_apply_rule:nnn {#1} {#2} {#3}
579 \exp_after:wN \use_none:n
580 \else:
581 \use:nn
582 \fi:
583 }
```

(End definition for `_hook_apply_label_pair:nnn` and `_hook_label_if_exist_apply:nnnF`.)

`_hook_apply_rule:nnn` This is the code executed in steps T2 and T3 while looping through the matrix This is
part of step T3. We are about to apply the next rule and enter it into the data structure.
The arguments are `<label1>`, `<label2>`, `<hook-name>`, and `<hook-code-plist>`.

```
584 \cs_new_protected:Npn \_hook_apply_rule:nnn #1#2#3
585 {
586 \cs:w \_hook_apply_
587 \cs:w g__hook_#3_reversed_tl \cs_end: rule_
588 \cs:w g__hook_ #3 _rule_ #1 | #2 _tl \cs_end: :nnn \cs_end:
```

```

589     {#1} {#2} {#3}
590 }

```

(End definition for `_hook_apply_rule:nnn`.)

`_hook_apply_rule_<:nnn` The most common cases are `<` and `>` so we handle that first. They are relations `<` and `>` in TAOCP, and they dictate sorting.

```

591 \cs_new_protected:cpn { \_hook_apply_rule_<:nnn } #1#2#3
592 {
593   \_hook_debug:n { \_hook_msg_pair_found:nnn {#1} {#2} {#3} }
594   \tl_set:cx { \_hook_tl_csname:n {#2} }
595   { \int_eval:n{ \cs:w \_hook_tl_csname:n {#2} \cs_end: + 1 } }
596   \seq_put_right:cn{ \_hook_seq_csname:n {#1} }{#2}
597 }
598 \cs_new_protected:cpn { \_hook_apply_rule_>:nnn } #1#2#3
599 {
600   \_hook_debug:n { \_hook_msg_pair_found:nnn {#1} {#2} {#3} }
601   \tl_set:cx { \_hook_tl_csname:n {#1} }
602   { \int_eval:n{ \cs:w \_hook_tl_csname:n {#1} \cs_end: + 1 } }
603   \seq_put_right:cn{ \_hook_seq_csname:n {#2} }{#1}
604 }

```

(End definition for `_hook_apply_rule_<:nnn` and `_hook_apply_rule_>:nnn`.)

`_hook_apply_rule_xE:nnn` These relations make two labels incompatible within a hook. `xE` makes raises an error if the labels are found in the same hook, and `xW` makes it a warning.

```

605 \cs_new_protected:cpn { \_hook_apply_rule_xE:nnn } #1#2#3
606 {
607   \_hook_debug:n { \_hook_msg_pair_found:nnn {#1} {#2} {#3} }
608   \msg_error:nnnnnn { hooks } { labels-incompatible }
609   {#1} {#2} {#3} { 1 }
610   \use:c { \_hook_apply_rule_>:nnn } {#1} {#2} {#3}
611   \use:c { \_hook_apply_rule_<:nnn } {#1} {#2} {#3}
612 }
613 \cs_new_protected:cpn { \_hook_apply_rule_xW:nnn } #1#2#3
614 {
615   \_hook_debug:n { \_hook_msg_pair_found:nnn {#1} {#2} {#3} }
616   \msg_warning:nnnnnn { hooks } { labels-incompatible }
617   {#1} {#2} {#3} { 0 }
618 }

```

(End definition for `_hook_apply_rule_xE:nnn` and `_hook_apply_rule_xW:nnn`.)

`_hook_apply_rule_>:nnn` If we see `->` we have to drop code for label `#3` and carry on. We could do a little better and drop everything for that label since it doesn't matter where we sort in the empty code. However that would complicate the algorithm a lot with little gain.⁹ So we still unnecessarily try to sort it in and depending on the rules that might result in a loop that is otherwise resolved. If that turns out to be a real issue, we can improve the code.

Here the code is removed from `\l_hook_cur_hook_tl` rather than `#3` because the latter may be `??`, and the default hook doesn't store any code. Removing from `\l_hook_cur_hook_tl` makes default rules `->` and `<-` work properly.

⁹This also has the advantage that the result of the sorting doesn't change which might otherwise (for unrelated chunks) if we aren't careful.

```

619 \cs_new_protected:cpn { __hook_apply_rule_>:nnn } #1#2#3
620 {
621   \__hook_debug:n
622   {
623     \__hook_msg_pair_found:nnn {#1} {#2} {#3}
624     \iow_term:x{--->~ Drop~ '#2'~ code~ from~
625       \iow_char:N \ \ g__hook_ \l__hook_cur_hook_tl _code_prop ~
626       because~ of~ '#1' }
627   }
628   \prop_put:Nnn \l__hook_work_prop {#2} { }
629 }
630 \cs_new_protected:cpn { __hook_apply_rule_<:nnn } #1#2#3
631 {
632   \__hook_debug:n
633   {
634     \__hook_msg_pair_found:nnn {#1} {#2} {#3}
635     \iow_term:x{--->~ Drop~ '#1'~ code~ from~
636       \iow_char:N \ \ g__hook_ \l__hook_cur_hook_tl _code_prop ~
637       because~ of~ '#2' }
638   }
639   \prop_put:Nnn \l__hook_work_prop {#1} { }
640 }

```

(End definition for __hook_apply_rule_>:nnn and __hook_apply_rule_<:nnn.)

__hook_apply_rule_<:nnn Reversed rules.

```

\__hook_apply_rule_>:nnn 641 \cs_new_eq:cc { __hook_apply_rule_<:nnn } { __hook_apply_rule_>:nnn }

```

`__hook_log_next_code:n`

(End definition for `\hook_show:n` and others. These functions are documented on page 174.)

```

\__hook_list_rules:nn
\__hook_list_one_rule:nnn
\__hook_list_if_rule_exists:nnnF

```

This macro takes a *hook* and an *inline function* and loops through each pair of *labels* in the *hook*, and if there is a relation between this pair of *labels*, the *inline function* is executed with `#1 = relation`, `#2 = label1 | label2`, and `#3 = hook` (the latter may be the argument `#1` to `__hook_list_rules:nn`, or `??` if it is a default rule).

```

762 \cs_new_protected:Npn \__hook_list_rules:nn #1 #2
763 {
764     \cs_set_protected:Npn \__hook_tmp:w ##1 ##2 ##3 {#2}
765     \prop_map_inline:cn { g__hook_#1_code_prop }
766     {
767         \prop_map_inline:cn { g__hook_#1_code_prop }
768         {
769             \__hook_if_label_case:nnnnn {##1} {####1}
770             { \prop_map_break: }
771             { \__hook_list_one_rule:nnn {##1} {####1} }
772             { \__hook_list_one_rule:nnn {####1} {##1} }
773             {#1}
774         }
775     }
776 }

```

These two are quite similar to `__hook_apply_label_pair:nnn` and `__hook_label_if_exist_apply:nnnF`, respectively, but rather than applying the rule, they pass it to the *inline function*.

```

777 \cs_new_protected:Npn \__hook_list_one_rule:nnn #1#2#3
778 {
779     \__hook_list_if_rule_exists:nnnF {#1} {#2} {#3}
780     { \__hook_list_if_rule_exists:nnnF {#1} {#2} { ?? } { } }
781 }
782 \cs_new_protected:Npn \__hook_list_if_rule_exists:nnnF #1#2#3
783 {
784     \if_cs_exist:w g__hook_ #3 _rule_ #1 | #2 _tl \cs_end:
785     \exp_args:Nv \__hook_tmp:w
786     { g__hook_ #3 _rule_ #1 | #2 _tl } { #1 | #2 } {#3}
787     \exp_after:wN \use_none:nn
788     \fi:
789     \use:n
790 }

```

(End definition for `_hook_list_rules:nn`, `_hook_list_one_rule:nnn`, and `_hook_list_if_rule_exists:nnnF`.)

`_hook_debug_print_rules:n` A shorthand for debugging that prints similar to `\prop_show:N`.

```

791 \cs_new_protected:Npn \_hook_debug_print_rules:n #1
792 {
793   \iow_term:n { The~hook~#1~contains~the~rules: }
794   \cs_set_protected:Npn \_hook_tmp:w ##1
795   {
796     \_hook_list_rules:nn {#1}
797     {
798       \iow_term:x
799       {
800         > ##1 {####2} ##1 => ##1 {####1}
801         \str_if_eq:nnT {####3} {??} { ~(default) }
802       }
803     }
804   }
805   \exp_args:No \_hook_tmp:w { \use:nn { ~ } { ~ } }
806 }

```

(End definition for `_hook_debug_print_rules:n`.)

3.8 Specifying code for next invocation

`\hook_gput_next_code:nn`

```

%!!!!\_hook_gput_next_code:nn
\_hook_gput_next_do:nn
\_hook_gput_next_do:Nnn
\_hook_clear_next:n
807 \cs_new_protected:Npn \hook_gput_next_code:nn #1
808 { \_hook_normalize_hook_args:Nn \_hook_gput_next_code:nn {#1} }
809 \cs_new_protected:Npn \_hook_gput_next_code:nn #1 #2
810 {
811   \_hook_declare:n {#1}
812   \hook_if_exist:nTF {#1}
813   { \_hook_gput_next_do:nn {#1} {#2} }
814   { \_hook_try_declaring_generic_next_hook:nn {#1} {#2} }
815 }
816 \cs_new_protected:Npn \_hook_gput_next_do:nn #1
817 {
818   \exp_args:Nc \_hook_gput_next_do:Nnn
819   { \_hook_next~#1 } {#1}
820 }

```

First check if the “next code” token list is empty: if so we need to add a `\tl_gclear:c` to clear it, so the code lasts for one usage only. The token list is cleared early so that nested usages don’t get lost. `\tl_gclear:c` is used instead of `\tl_gclear:N` in case the hook is used in an expansion-only context, so the token list doesn’t expand before `\tl_gclear:N`: that would make an infinite loop. Also in case the main code token list is empty, the hook code has to be updated to add the next execution token list.

```

821 \cs_new_protected:Npn \_hook_gput_next_do:Nnn #1 #2
822 {
823   \tl_if_empty:cT { \_hook~#2 }
824   { \_hook_update_hook_code:n {#2} }
825   \tl_if_empty:NT #1
826   { \_hook_tl_gset:Nn #1 { \_hook_clear_next:n {#2} } }
827   \_hook_tl_gput_right:Nn #1

```

```

828 }
829 \cs_new_protected:Npn \__hook_clear_next:n #1
830 { \cs_gset_eq:cN { __hook_next~#1 } \c_empty_tl }

```

(End definition for `\hook_gput_next_code:nn` and others. This function is documented on page 172.)

3.9 Using the hook

```

\hook_use:n \hook_use:n as defined here is used in the preamble, where hooks aren't initialized
\__hook_use_initialized:n by default. \__hook_use_initialized:n is also defined, which is the non-\protected
\__hook_use_undefined:w version for use within the document. Their definition is identical, except for the \__-
\__hook_use_end: hook_preamble_hook:n (which wouldn't hurt in the expandable version, but it would be
\__hook_preamble_hook:n an unnecessary extra expansion).

```

`__hook_use_initialized:n` holds the expandable definition while in the preamble. `__hook_preamble_hook:n` initializes the hook in the preamble, and is redefined to `\use_none:n` at `\begin{document}`.

Both versions do the same internally: check if the hook exist as given, and if so use it as quickly as possible. If it doesn't exist, the a call to `__hook_use:wn` checks for file hooks.

At `\begin{document}`, all hooks are initialized, and any change in them causes an update, so `\hook_use:n` can be made expandable. This one is better not protected so that it can expand into nothing if containing no code. Also important in case of generic hooks that we do not generate a `\relax` as a side effect of checking for a csname. In contrast to the \TeX low-level `\csname ... \endcsname` construct `\tl_if_exist:c` is careful to avoid this.

```

831 \cs_new_protected:Npn \hook_use:n #1
832 {
833   \tl_if_exist:cTF { __hook~#1 }
834   {
835     \__hook_preamble_hook:n {#1}
836     \cs:w __hook~#1 \cs_end:
837   }
838   { \__hook_use:wn #1 / \s__hook_mark {#1} }
839 }
840 \cs_new:Npn \__hook_use_initialized:n #1
841 {
842   \if_cs_exist:w __hook~#1 \cs_end:
843   \else:
844     \__hook_use_undefined:w
845     \fi:
846     \cs:w __hook~#1 \__hook_use_end:
847 }
848 \cs_new:Npn \__hook_use_undefined:w #1 #2 __hook~#3 \__hook_use_end:
849 {
850   #1 % fi
851   \__hook_use:wn #3 / \s__hook_mark {#3}
852 }
853 \cs_new_protected:Npn \__hook_preamble_hook:n #1
854 { \__hook_initialize_hook_code:n {#1} }
855 \cs_new_eq:NN \__hook_use_end: \cs_end:

```

(End definition for `\hook_use:n` and others. This function is documented on page 172.)

`__hook_use:wn` `__hook_use:wn` does a quick check to test if the current hook is a file hook: those need a special treatment. If it is not, the hook does not exist. If it is, then `__hook_try_file_hook:n` is called, and checks that the current hook is a file-specific hook using `__hook_if_file_hook:wTF`. If it's not, then it's a generic file/ hook and is used if it exist.

If it is a file-specific hook, it passes through the same normalization as during declaration, and then it is used if defined. `__hook_if_exist_use:n` checks if the hook exist, and calls `__hook_preamble_hook:n` if so, then uses the hook.

```

856 \cs_new:Npn \__hook_use:wn #1 / #2 \s__hook_mark #3
857 {
858   \str_if_eq:nnTF {#1} { file }
859     { \__hook_try_file_hook:n {#3} }
860     { } % Hook doesn't exist
861 }
862 \cs_new_protected:Npn \__hook_try_file_hook:n #1
863 {
864   \__hook_if_file_hook:wTF #1 / / \s__hook_mark
865   {
866     \exp_args:Ne \__hook_if_exist_use:n
867       { \exp_args:Ne \__hook_file_hook_normalize:n {#1} }
868   }
869   { \__hook_if_exist_use:n {#1} } % file/ generic hook (e.g. file/before)
870 }
871 \cs_new_protected:Npn \__hook_if_exist_use:n #1
872 {
873   \tl_if_exist:cT { __hook~#1 }
874   {
875     \__hook_preamble_hook:n {#1}
876     \cs:w __hook~#1 \cs_end:
877   }
878 }

```

(End definition for `__hook_use:wn`, `__hook_try_file_hook:n`, and `__hook_if_exist_use:n`.)

`\hook_use_once:n` For hooks that can and should be used only once we have a special use command that remembers the hook name in `\g__hook_execute_immediately_prop`. This has the effect that any further code added to the hook is executed immediately rather than stored in the hook.

The code needs some gymnastics to prevent space trimming from the hook name, since `\hook_use:n` and `\hook_use_once:n` are documented to not trim spaces.

PhO: Should this raise an error if the hook doesn't exist?

```

879 \cs_new_protected:Npn \hook_use_once:n #1
880 {
881   \tl_if_exist:cT { __hook~#1 }
882   {
883     \tl_set:Nn \l__hook_return_tl {#1}
884     \__hook_normalize_hook_args:Nn \__hook_use_once_store:n
885       { \l__hook_return_tl }
886     \hook_use:n {#1}
887   }
888 }

```

```

889 \cs_new_protected:Npn \__hook_use_once_store:n #1
890 { \prop_gput:Nnn \g__hook_execute_immediately_prop {#1} { } }

```

(End definition for `\hook_use_once:n`. This function is documented on page 172.)

3.10 Querying a hook

Simpler data types, like token lists, have three possible states; they can exist and be empty, exist and be non-empty, and they may not exist, in which case emptiness doesn't apply (though `\tl_if_empty:N` returns false in this case).

Hooks are a bit more complicated: they have four possible states. A hook may exist or not, and either way it may or may not be empty (even a hook that doesn't exist may be non-empty).

A hook is said to be empty when no code was added to it, either to its permanent code pool, or to its “next” token list. The hook doesn't need to be declared to have code added to its code pool (it may happen that a package *A* defines a hook `foo`, but it's loaded after package *B*, which adds some code to that hook. In this case it is important that the code added by package *B* is remembered until package *A* is loaded).

A hook is said to exist when it was declared with `\hook_new:n` or some variant thereof.

`\hook_if_empty_p:n` Test if a hook is empty (that is, no code was added to that hook). A $\langle hook \rangle$ being empty means that all three of its `\g__hook_<hook>_code_prop`, its `__hook_toplevel <hook>` and its `__hook_next <hook>` are empty.

```

891 \prg_new_conditional:Npnn \hook_if_empty:n #1 { p , T , F , TF }
892 {
893   \__hook_if_exist:nTF {#1}
894   {
895     \bool_lazy_and:nnTF
896     { \prop_if_empty_p:c { g__hook_#1_code_prop } }
897     {
898       \bool_lazy_and_p:nn
899       { \tl_if_empty_p:c { __hook_toplevel~#1 } }
900       { \tl_if_empty_p:c { __hook_next~#1 } }
901     }
902     { \prg_return_true: }
903     { \prg_return_false: }
904   }
905   { \prg_return_true: }
906 }

```

(End definition for `\hook_if_empty:nTF`. This function is documented on page 173.)

`\hook_if_exist_p:n` A canonical way to test if a hook exists. A hook exists if the token list that stores the sorted code for that hook, `__hook <hook>`, exists. The property list `\g__hook_<hook>_code_prop` cannot be used here because often it is necessary to add code to a hook without knowing if such hook was already declared, or even if it will ever be (for example, in case the package that defines it isn't loaded).

```

907 \prg_new_conditional:Npnn \hook_if_exist:n #1 { p , T , F , TF }
908 {
909   \tl_if_exist:cTF { __hook~#1 }
910   { \prg_return_true: }
911   { \prg_return_false: }

```

912 }

(End definition for `\hook_if_exist:nTF`. This function is documented on page 173.)

`__hook_if_exist_p:n` An internal check if the hook has already been declared with `__hook_declare:n`. This means that the hook was already used somehow (a code chunk or rule was added to it), but it still wasn't declared with `\hook_new:n`.

`__hook_if_exist:nTF`

```
913 \prg_new_conditional:Npnn \__hook_if_exist:n #1 { p , T , F , TF }
914 {
915   \prop_if_exist:cTF { g__hook_#1_code_prop }
916   { \prg_return_true: }
917   { \prg_return_false: }
918 }
```

(End definition for `__hook_if_exist:nTF`.)

`__hook_if_reversed_p:n` An internal conditional that checks if a hook is reversed.

`__hook_if_reversed:nTF`

```
919 \prg_new_conditional:Npnn \__hook_if_reversed:n #1 { p , T , F , TF }
920 {
921   \if_int_compare:w \cs:w g__hook_#1_reversed_tl \cs_end: 1 < 0 \exp_stop_f:
922   \prg_return_true:
923   \else:
924   \prg_return_false:
925   \fi:
926 }
```

(End definition for `__hook_if_reversed:nTF`.)

\SetDefaultHookLabel

\PushDefaultHookLabel

\PopDefaultHookLabel

\DeclareDefaultHookLabel

_hook_curr_name_push:n

_hook_curr_name_push_aux:n

_hook_curr_name_pop:

_hook_end_document_label_check:

The token list `\g__hook_hook_curr_name_tl` stores the name of the current package/file to be used as label for hooks. Providing a consistent interface is tricky, because packages can be loaded within packages, and some packages may not use `\SetDefaultHookLabel` to change the default label (in which case `\@currname` is used).

To pull that one off, we keep a stack that contains the default label for each level of input. The bottom of the stack contains the default label for the `top-level` (this stack should never go empty). If we're building the format, set the default label to be `top-level`:

```

1014 \tl_gset:Nn \g__hook_hook_curr_name_tl { top-level }

```

Then, in case we're in `latexrelease` we push something on the stack to support roll forward. But in some rare cases, `latexrelease` may be loaded inside another package (notably `platexrelease`), so we'll first push the `top-level` entry:

```

1015 <latexrelease>\seq_gput_right:Nn \g__hook_name_stack_seq { top-level }

```

then we dissect the `\@currnamestack`, adding `\@currname` to the stack:

```

1016 <latexrelease>\cs_set_protected:Npn \_hook_tmp:w #1 #2 #3
1017 <latexrelease> {
1018 <latexrelease>   \quark_if_recursion_tail_stop:n {#1}
1019 <latexrelease>   \seq_gput_right:Nn \g__hook_name_stack_seq {#1}
1020 <latexrelease>   \_hook_tmp:w
1021 <latexrelease> }
1022 <latexrelease>\exp_after:wN \_hook_tmp:w \@currnamestack
1023 <latexrelease> \q_recursion_tail \q_recursion_tail
1024 <latexrelease> \q_recursion_tail \q_recursion_stop

```

and finally set the default label to be the \@currname:

```
1025 \latexrelease\l_gset:Nx \g__hook_hook_curr_name_tl { \@currname }
```

Two commands keep track of the stack: when a file is input, __hook_curr_name_push:n pushes the current default label to the stack, and sets the new default label in one go:

```
1026 \cs_new_protected:Npn \__hook_curr_name_push:n #1
1027 { \exp_args:Nx \__hook_curr_name_push_aux:n { \__hook_make_name:n {#1} } }

1041     }
1042   }
1043 }
```

and when an input is over, the topmost item of the stack is popped, since the label will not be used again, and \g__hook_hook_curr_name_tl is updated to the now topmost item of the stack:

```
1044 \cs_new_protected:Npn \__hook_curr_name_pop:
1045 {
1046   \seq_gpop:NNTF \g__hook_name_stack_seq \l__hook_return_tl
1047   { \tl_gset_eq:NN \g__hook_hook_curr_name_tl \l__hook_return_tl }
1048   { \msg_error:nn { hooks } { extra-pop-label } }
1049 }
```

At the end of the document we want to check if there was no __hook_curr_name_push: without a matching __hook_curr_name_pop: (not a critical error, but it might indicate that something else is not quite right):

```
1050 \tl_gput_right:Nn \@kernel@after@enddocument@afterlastpage
1051 { \__hook_end_document_label_check: }
1052 \cs_new_protected:Npn \__hook_end_document_label_check:
1053 {
1054   \seq_gpop:NNT \g__hook_name_stack_seq \l__hook_return_tl
1055   {
1056     \msg_error:nnx { hooks } { missing-pop-label }
1057     { \g__hook_hook_curr_name_tl }
1058     \tl_gset_eq:NN \g__hook_hook_curr_name_tl \l__hook_return_tl
1059     \__hook_end_document_label_check:
1060   }
1061 }
```

The token list \g__hook_hook_curr_name_tl is but a mirror of the top of the stack.

Now define a wrapper that replaces the top of the stack with the argument, and updates \g__hook_hook_curr_name_tl accordingly.

```
1062 \NewDocumentCommand \SetDefaultHookLabel { m }
```

```

1063 {
1064   \seq_if_empty:NTF \g__hook_name_stack_seq
1065   {
1066     \msg_error:nnnnn { hooks } { set-top-level }
1067     { for } { SetDefaultHookLabel } {#1}
1068   }
1069   { \exp_args:Nx \__hook_set_default_label:n { \__hook_make_name:n {#1} } }
1070 }
1071 \cs_new_protected:Npn \__hook_set_default_label:n #1
1072 {
1073   \str_if_eq:nnTF {#1} { top-level }
1074   {
1075     \msg_error:nnnnn { hooks } { set-top-level }
1076     { to } { SetDefaultHookLabel } {#1}
1077   }
1078   { \tl_gset:Nn \g__hook_hook_curr_name_tl {#1} }
1079 }
1080 \NewDocumentCommand \DeclareDefaultHookLabel { m }
1081 {
1082   \msg_error:nn { hooks } { ddhl-deprecated }
1083   \SetDefaultHookLabel {#1}
1084 }

```

The label is only automatically updated with `\@onefilewithoptions` (`\usepackage` and `\documentclass`), but some packages, like `TikZ`, define package-like interfaces, like `\usetikzlibrary` that are wrappers around `\input`, so they inherit the default label currently in force (usually `top-level`, but it may change if loaded in another package). To provide a package-like behaviour also for hooks in these files, we provide high-level access to the default label stack.

```

1085 \NewDocumentCommand \PushDefaultHookLabel { m }
1086 { \__hook_curr_name_push:n {#1} }
1087 \NewDocumentCommand \PopDefaultHookLabel { }
1088 { \__hook_curr_name_pop: }

```

The current label stack holds the labels for all files but the current one (more or less like `\@currnamestack`), and the current label token list, `\g__hook_hook_curr_name_tl`, holds the label for the current file. However `\@pushfilename` happens before `\@currname` is set, so we need to look ahead to get the `\@currname` for the label. `expl3` also requires the current file in `\@pushfilename`, so here we abuse `\@expl@push@filename@aux@@` to do `__hook_curr_name_push:n`.

```

1089 \cs_gset_protected:Npn \@expl@push@filename@aux@@ #1#2#3
1090 {
1091   \__hook_curr_name_push:n {#3}
1092   \str_gset:Nx \g_file_curr_name_str {#3}
1093   #1 #2 {#3}
1094 }

```

(End definition for `\SetDefaultHookLabel` and others. These functions are documented on page 167.)

`\UseHook` Avoid the overhead of `xparse` and its protection that we don't want here (since the hook should vanish without trace if empty)!

`\UseOneTimeHook`

```

1095 \cs_new:Npn \UseHook { \hook_use:n }
1096 \cs_new:Npn \UseOneTimeHook { \hook_use_once:n }

```

(End definition for `\UseHook` and `\UseOneTimeHook`. These functions are documented on page 163.)

\ShowHook

\LogHook

```
1097 \cs_new_protected:Npn \ShowHook { \hook_show:n }
1098 \cs_new_protected:Npn \LogHook { \hook_log:n }
```

(End definition for \ShowHook and \LogHook. These functions are documented on page 170.)

\DebugHooksOn

\DebugHooksOff

```
1099 \cs_new_protected:Npn \DebugHooksOn { \hook_debug_on: }
1100 \cs_new_protected:Npn \DebugHooksOff { \hook_debug_off: }
```

(End definition for \DebugHooksOn and \DebugHooksOff. These functions are documented on page 171.)

\DeclareHookRule

```
1101 \NewDocumentCommand \DeclareHookRule { m m m m }
1102 { \hook_gset_rule:nnnn {#1}{#2}{#3}{#4} }
```

(End definition for \DeclareHookRule. This function is documented on page 168.)

\DeclareDefaultHookRule

This declaration is only supported before \begin{document}.

```
1103 \NewDocumentCommand \DeclareDefaultHookRule { m m m }
1104 { \hook_gset_rule:nnnn {??}{#1}{#2}{#3} }
1105 \@onlypreamble\DeclareDefaultHookRule
```

(End definition for \DeclareDefaultHookRule. This function is documented on page 169.)

\ClearHookRule

A special setup rule that removes an existing relation. Basically @@_rule_gclear:nm plus fixing the property list for debugging.

FMi: Need an L3 interface, or maybe it should get dropped?

```
1106 \NewDocumentCommand \ClearHookRule { m m m }
1107 { \hook_gset_rule:nnnn {#1}{#2}{unrelated}{#3} }
```

(End definition for \ClearHookRule. This function is documented on page 169.)

\IfHookExistsTF

\IfHookEmptyTF

Here we avoid the overhead of xparse, since \IfHookEmptyTF is used in \end (that is, every L^AT_EX environment). As a further optimisation, use \let rather than \def to avoid one expansion step.

```
1108 \cs_new_eq:NN \IfHookExistsTF \hook_if_exist:nTF
1109 \cs_new_eq:NN \IfHookEmptyTF \hook_if_empty:nTF
```

(End definition for \IfHookExistsTF and \IfHookEmptyTF. These functions are documented on page 170.)

3.13 Internal commands needed elsewhere

Here we set up a few horrible (but consistent) L^AT_EX_{2 ϵ} names to allow for internal commands to be used outside this module. We have to unset the @@ since we want double “at” sign in place of double underscores.

```

1110 <@@=)

\@expl@@@initialize@all@@
  \@expl@@@hook@curr@name@pop@@
1111 \cs_new_eq:NN \@expl@@@initialize@all@@
1112         \__hook_initialize_all:

1113 \cs_new_eq:NN \@expl@@@hook@curr@name@pop@@
1114         \__hook_curr_name_pop:

(End definition for \@expl@@@initialize@all@@ and \@expl@@@hook@curr@name@pop@@.)

1115 \ExplSyntaxOff

```

Rolling back here doesn’t undefine the interface commands as they may be used in packages without rollback functionality. So we just make them do nothing which may or may not work depending on the code usage.

```

1 Counters

This section deals with counter and other variable allocation.

```
1 <*2ekernel>
```

The following are from plain T_EX:

`\z@` A zero dimen or number. It's more efficient to write `\parindent\z@` than `\parindent 0pt`.

`\@ne` The number 1.

`\m@ne` The number -1 .

`\tw@` The number 2.

`\sist@@n` The number 16.

`\@m` The number 1000.

`\@MM` The number 20000.

`\@xxxii` The constant 32.

```
2 \chardef\@xxxii=32
```

(End definition for \@xxxii.)

`\@Mi` Constants 10001–10004.

```
\@Mii 3 \mathchardef\@Mi=10001
```

```
\@Miii 4 \mathchardef\@Mii=10002
```

```
\@Miv 5 \mathchardef\@Miii=10003
```

```
6 \mathchardef\@Miv=10004
```

(End definition for \@Mi and others.)

`\@tempcnta` Scratch count registers used by L^AT_EX kernel commands.

```
\@tempcntb 7 \newcount\@tempcnta
```

```
8 \newcount\@tempcntb
```

(End definition for \@tempcnta and \@tempcntb.)

`\if@tempswa` General boolean switch used by L^AT_EX kernel commands.

```
9 \newif\if@tempswa
```

(End definition for \if@tempswa.)

`\@tempdima` Scratch dimen registers used by L^AT_EX kernel commands.

```
\@tempdimb 10 \newdimen\@tempdima
```

```
\@tempdimc 11 \newdimen\@tempdimb
```

```
12 \newdimen\@tempdimc
```

(End definition for \@tempdima, \@tempdimb, and \@tempdimc.)

`\@tempboxa` Scratch box register used by L^AT_EX kernel commands.
¹³ `\newbox\@tempboxa`
(End definition for \@tempboxa.)

`\@tempskipa` Scratch skip registers used by L^AT_EX kernel commands.
`\@tempskipb` ¹⁴ `\newskip\@tempskipa`
¹⁵ `\newskip\@tempskipb`
(End definition for \@tempskipa and \@tempskipb.)

`\@temptokena` Scratch token register used by L^AT_EX kernel commands.
¹⁶ `\newtoks\@temptokena`
(End definition for \@temptokena.)

`\@flushglue` Glue used for `\right-` & `\leftskip = 0pt plus 1fil`
¹⁷ `\newskip\@flushglue \@flushglue = 0pt plus 1fil`
(End definition for \@flushglue.)
¹⁸ `\</2ekernel>`

1 Program control structure

This section defines a number of control structure macros, such as while-loops and for-loops.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```

1 \*2kernel)
2 \message{control,}

\@whilenum TEST \do {BODY}
\@whiledim TEST \do {BODY} : These implement the loop
    while TEST do BODY od
    where TEST is a TeX \ifnum or \ifdim test, respectively.
    They are optimized for the normal case of TEST initially false.

\@whilesw SWITCH \fi {BODY} : Implements the loop
    while SWITCH do BODY od
    Optimized for normal case of SWITCH initially false.

\@for NAME := LIST \do {BODY} : Assumes that LIST expands to A1,A2,
    ... ,An .
    Executes BODY n times, with NAME = Ai on the i-th iteration.
    Optimized for the normal case of n = 1. Works for n=0.

\@tfor NAME := LIST \do {BODY}
    if, before expansion, LIST = T1 ... Tn where each Ti is a
    token or {...}, then executes BODY n times, with NAME = Ti
    on the i-th iteration. Works for n=0.

NOTES: 1. These macros use no \@temp sequences.
        2. These macros do not work if the body contains anything that
        looks syntactically to TeX like an improperly balanced \if
        \else \fi.

\@whilenum TEST \do {BODY} ==
BEGIN
  if TEST
  then BODY
    \@iwhilenum{TEST \relax BODY}
END

\@iwhilenum {TEST BODY} ==
BEGIN
  if TEST
  then BODY
    \@nextwhile = def(\@iwhilenum)

```

```

        else \@nextwhile = def(\@whilenoop)
      fi
      \@nextwhile {TEST BODY}
    END

\@whilesw SWITCH \fi {BODY} ==

1 Error handling and tracing

This section defines L^AT_EX's error commands.

```
1 <*2kernel>
```

The ‘2kernel’ code ensures that a `\usepackage{autoerr}` is essentially ignored if a ‘full’ format is being used that has the error messages already in the format.

These days we don't support autoloading approach any longer, but this part bit is kept in case it is used in old documents.

```
2 \expandafter\let\csname ver@autoerr.sty\endcsname\fmtversion
```

1.1 General commands

\MessageBreak This command prints a new-line inside a message, followed by a continuation line begun with `\@msg@continuation`. Normally it is defined to be `\relax`, but inside messages, it is let to `\@message@break`.

```
3 \let\MessageBreak\relax
```

(End definition for \MessageBreak.)

\GenericInfo This takes two arguments: a continuation and a message, and sends the result to the log file.

```
4 \DeclareRobustCommand{\GenericInfo}[2]{%
5   \begingroup
6     \def\MessageBreak{^^J#1}%
7     \set@display@protect
8     \immediate\write\m@ne{#2\on@line.}%
9   \endgroup
10 }
```

(End definition for \GenericInfo.)

\GenericWarning This takes two arguments: a continuation and a message, and sends the result to the screen.

```
11 \DeclareRobustCommand{\GenericWarning}[2]{%
12   \begingroup
13     \def\MessageBreak{^^J#1}%
14     \set@display@protect
15     \immediate\write\@unused{^^J#2\on@line.^^J}%
16   \endgroup
17 }
```

(End definition for \GenericWarning.)

`\GenericError` This macro takes four arguments: a continuation, an error message, where to go for further information, and the help information. It displays the error message, and sets the error help (the result of typing `h` to the prompt), and does a horrible hack to turn the last context line (which by default is the only context line) into just three dots. This could be made more efficient.

```

18 \bgroup
19 \lccode'\@=' \ %
20 \lccode'\~=' \ %
21 \lccode'\}=' \ %
22 \lccode'\{=' \ %
23 \lccode'\T=' \T%
24 \lccode'\H=' \H%
25 \catcode'\ =11\relax%
26 \lowercase{%
27 \egroup%
```

Unfortunately \TeX versions older than 3.141 have a bug which means that `^^J` does not force a linebreak in `\message` and `\errmessage` commands. So for these old \TeX 's we use `\typeout` to produce the message, and then have an empty `\errmessage` command. This causes an extra line of the form

.

To appear on the terminal, but if you do not like it, you can always upgrade your \TeX ! In order for your format to use this version, you must define the macro `\TeXversion` to be the version number, e.g., 3.14 of the underlying \TeX . See the comments in `ltdircheck.dtx`.

```

28 \dimen@ifx\TeXversion\undefined4\else\TeXversion\fi\p@%
29 \ifdim\dimen@>3.14\p@%
    First the 'standard case'.
30 \DeclareRobustCommand{\GenericError}[4]{%

(End definition for \GenericError.)

<pre> \PackageError \PackageWarning \PackageWarningNoLine \PackageInfo \ClassError \ClassWarning \ClassWarningNoLine \ClassInfo </pre>	<p>These commands are intended for use by package and class writers, to give information to authors. The syntax is:</p> <pre> \PackageError{<package>}{<error>}{<help>} \PackageWarning{<package>}{<warning>} \PackageWarningNoLine{<package>}{<warning>} \PackageInfo{<package>}{<info>} </pre>
----------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

and similarly for classes. The **Error** commands print the *<error>* message, and present the interactive prompt; if the author types **h**, then the *<help>* information is displayed. The **Warning** commands produce a warning but do not present the interactive prompt. The **WarningNoLine** commands do the same, but don't print the input line number. The **Info** commands write the message to the log file. Within the messages, the command `\MessageBreak` can be used to break a line, `\protect` can be used to protect command names, and `\space` is a space, for example:

```

\newcommand{\foo}{F00}
\PackageWarning{ethel}{%
  Your hovercraft is full of eels,\MessageBreak
  and \protect\foo\space is \foo}

```

produces:

```

Package ethel warning: Your hovercraft is full of eels,
(ethel)                and \foo is F00 on input line 54.

```

```

\@badmath Called by \[, \], \(or \) when used in wrong mode.

```

201 \gdef\@badmath{%
202   \@latex@error{Bad math environment delimiter}\@eha}

```

	(End definition for <code>\@badmath</code> .)
<code>\@toodeep</code>	Called by a list environment nested more than six levels deep, or an enumerate or itemize nested more than four levels. <pre> 203 \gdef\@toodeep{% 204 \latex@error{Too deeply nested}\@ehd} </pre> (End definition for <code>\@toodeep</code> .)
<code>\@badpoptabs</code>	Called by <code>\endtabbing</code> when not enough <code>\poptabs</code> have occurred, or by <code>\poptabs</code> when too many have occurred. <pre> 205 \gdef\@badpoptabs{% 206 \latex@error{\protect\pushtabs\space and \protect\poptabs 207 \space don't match}\@ehd} </pre> (End definition for <code>\@badpoptabs</code> .)
<code>\@badtab</code>	Called by <code>\></code> , <code>\+</code> , <code>\-</code> or <code>\<</code> when stepping to an undefined tab. <pre> 208 \gdef\@badtab{% 209 \latex@error{Undefined tab position}\@ehd} </pre> (End definition for <code>\@badtab</code> .)
<code>\@preamerr</code>	This error is special: it appears in places where we normally have to <code>\protect</code> expansions. However, to prevent a protection of the error message itself (which would result in the message getting printed not issued on the terminal) we need to locally reset <code>\protect</code> to <code>\relax</code> . <pre> 210 \gdef\@preamerr#1{% 211 \begingroup 212 \let\protect\relax 213 \latex@error{\ifcase #1 Illegal character\or 214 Missing @-exp\or Missing p-arg\fi\space 215 in array arg}\@ehd 216 \endgroup} </pre> (End definition for <code>\@preamerr</code> .)
<code>\@badlinearg</code>	Occurs in <code>\line</code> and <code>\vector</code> command when a bad slope argument is encountered. <pre> 217 \gdef\@badlinearg{% 218 \latex@error{% 219 Bad \protect\line\space or \protect\vector 220 \space argument}\@ehb} </pre> (End definition for <code>\@badlinearg</code> .)
<code>\@parmoderr</code>	Occurs in a float environment or a <code>\marginpar</code> when encountered in inner vertical mode. <pre> 221 \gdef\@parmoderr{% 222 \latex@error{Not in outer par mode}\@ehb} </pre> (End definition for <code>\@parmoderr</code> .)
<code>\@fltovf</code>	Occurs in float environment or <code>\marginpar</code> when there are no more free boxes for storing floats. <pre> 223 \gdef\@fltovf{% 224 \latex@error{Too many unprocessed floats}\@ehb} </pre>

(End definition for \fltovf.)

\@latexbug Occurs in output routine. This is bad news.

```
225 \gdef\@latexbug{%  
226   \@latex@error{This may be a LaTeX bug}{Call for help}}
```

(End definition for \@latexbug.)

\@badcrerr This error was removed and replaced by \@nolnerr.

```
227 %\def\@badcrerr {\@latex@error{Bad use of \protect\\}\@ehc}
```

(End definition for \@badcrerr.)

\@noitemerr \addvspace or \addpenalty was called when not in vmode. Probably caused by a missing \item.

```
228 \gdef\@noitemerr{%  
229   \@latex@error{Something's wrong--perhaps a missing %  
230     \protect\item}\@ehc}
```

(End definition for \@noitemerr.)

\@notprerr A command that can be used only in the preamble appears after the command \begin{document}.

```
231 \gdef\@notprerr{%  
232   \@latex@error{Can be used only in preamble}\@eha}
```

(End definition for \@notprerr.)

\@inmatherr Issued by commands that don't work correctly within math (like \item). There is no real error recovery happening, e.g., the user might get additional errors afterwards.

```
233 \gdef\@inmatherr#1{%  
234   \relax  
235   \ifmmode  
236     \@latex@error{Command \protect#1 invalid in math mode}\@ehc  
237     \fi}
```

(End definition for \@inmatherr.)

\@invalidchar An error for use with invalid characters. This is commented out, since we decided to use catcode 15 instead.

```
238 %\def\@invalidchar{\@latex@error{Invalid character in input}\@ehc}
```

(End definition for \@invalidchar.)

As well as the above error commands some error messages are directly coded to save space. The messages already present in L^AT_EX 2.09 include:

Environment --- undefined

Issued by \begin for undefined environment.

Tab overflow

Occurs in \= when maximum number of tabs exceeded.

\< in mid line

Occurs in \< when it appears in middle of line.

Float(s) lost

In output routine, caused by a float environment or \marginpar occurring in inner vertical mode.

1.3 Tracing

The `trace` package implements the commands `\traceon` and `\traceoff` that work similar to `\tracingall` but skip certain code blocks that produce a lot of tracing output being of no interest during debugging (for example loading a font). Code blocks that should be hidden during tracing need to be surrounded by the macros `\conditionally@traceoff` and `\conditionally@traceon`.

For the kernel code the `trace` package then redefines a number of macros to include this tracing support.

However, in order to allow any macro package to react to `\traceon` we also provide dummy definitions for the two commands in the kernel so that they can be used by external packages without the need to distinguish between `trace` being loaded or not.

```
\conditionally@traceon  These are only dummy definitions. For details see the trace package.
\conditionally@traceoff
239 \let\conditionally@traceon\@empty
240 \let\conditionally@traceoff\@empty

(End definition for \conditionally@traceon and \conditionally@traceoff.)

241 \</2ekernel>
```

File 1

ltpar.dtx

1 Paragraphs

This section of the kernel declares the commands used to set `\par` and `\everypar` whenever their function needs to be changed for a long time.

1.1 Implementation

There are two situations in which `\par` may be changed:

- Long-term changes, in which the new value is to remain in effect until the current environment is left. The environments that change `\par` in this way are the following:
 - All list environments (itemize, quote, etc.)
 - Environments that turn `\par` into a noop: tabbing, array and tabular.
- Temporary changes, in which `\par` is restored to its previous value the next time it is executed. The following are all such uses.
 - `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
 - The mechanism for avoiding page breaks and getting the spacing right after section heads.

`\@setpar` To permit the proper interaction of these two situations, long-term changes are made by the `\@setpar{<VAL>}` command. Its function is:

To set `\par`. It `\def`'s `\par` and `\@par` to `<VAL>`.

`\@restorepar` Short-term changes are made by the usual `\def\par` commands. The original values are restored after a short-term change by the `\@restorepar` commands.

`\@@par` `\@@par` always is defined to be the original TeX `\par`.

`\everypar` `\everypar` is changed only for the short term. Whenever `\everypar` is set non-null, it should restore itself to null when executed.

The following commands change `\everypar` in this way:

- `\item`
- `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
- `\minipage`

When dealing with `\par` and `\everypar` remember the following two warnings:

1. Commands that make short-term changes to `\par` and `\everypar` must take account of the possibility that the new commands and the ones that do the restoration may be executed inside a group. In particular, `\everypar` is executed inside a group whenever a new paragraph begins with a left brace. The `\everypar` command that restores its definition should be local to the current group (in case the command is inside a minipage used inside someplace where `\everypar` has been redefined).

Thus, if `\everypar` is redefined to do an `\everypar{}` it could take several executions of `\everypar` before the restoration “holds”. This usually causes no problem. However, to prevent the extra executions from doing harm, use a global switch to keep anything harmful in the new `\everypar` from being done twice.

2. Commands that change `\everypar` should remember that `\everypar` might be supposed to set the following switches false:

- `@nobreak`
- `@minipage`

they should do the setting if necessary.

```

1 <*2ekernel>
2 \message{par,}

```

`\@setpar` Initiate a long-term change to `\par`.

```

\@par 3 \def\@setpar#1{\def\par{#1}\def\@par{#1}}

```

The default definition of `\@par` will ensure that if `\@restorepar` defines `\par` to execute `\@par` it will redefine itself to the primitive `\@@par` after one iteration.

```

4 \def\@par{\let\par\@@par\par}

```

(End definition for \@setpar and \@par.)

`\@restorepar` Restore from a short-term change to `\par`.

```

5 \def\@restorepar{\def\par{\@par}}
6 </2ekernel>

```

(End definition for \@restorepar.)

File m

ltspace.dtx

1 Spacing

This section deals with spacing, and line- and page-breaking.

1.1 User Commands

`\nopagebreak` [$\langle i \rangle$] : $\langle i \rangle = 0, \dots, 4$.
 Default argument = 4. Puts a penalty into the vertical list output as follows:
 0 : penalty = 0
 1 : penalty = `\@lowpenalty`
 2 : penalty = `\@medpenalty`
 3 : penalty = `\@highpenalty`
 4 : penalty = 10000
`\pagebreak` [$\langle i \rangle$] : same as except negatives of its penalty
`\linebreak` [$\langle i \rangle$] : analog of the above
`\nolinebreak` [$\langle i \rangle$] : analog of the above
`\samepage` : inhibits page breaking most places by setting the following penalties to 10000:
 `\interlinepenalty`
 `\postdisplaypenalty`
 `\interdisplaylinepenalty`
 `\@beginparpenalty`
 `\@endparpenalty`
 `\@itempenalty`
 `\@secpenalty`
 `\interfootnotelinepenalty`
`\` : initially defined to be `\newline`
`\` [$\langle length \rangle$] : initially defined to be `\vspace{\langle length \rangle}\newline`
 Note: `\`* adds a `\vadjust{\penalty 10000}`
 OBSOLETE COMMANDS (which never made it into the manual):
 `\obeycr` : defines `<CR> == \`
 `\restorecr` : restores `<CR>` to its usual meaning.

1.2 Chris' comments

There are several aspects of the handling of space in horizontal mode that are inconsistent or do not work well in some cases. These are largely concerned with ignoring the effect of space tokens that would otherwise typeset an inter-word space.

Negating the effect of such space tokens is achieved by two mechanisms:

- `\unskip` is used to remove the glue just added by a space that has already had its effect; it is sometimes invoked after an `\ifdim` test on `\lastskip` (see below);
- `\ignorespaces` is used to ignore space-tokens yet to come.

The test done on `\lastskip` is sometimes for equality with zero and sometimes for being positive. Recall also that the test is only on the natural length of the glue and that no glue cannot be distinguished from glue whose natural length is zero: to summarise, a pretty awful test. It is not clear why these tests are not all the same; I think that they should all be for equality. One place where `\unskip` is often used is just before a `\par` (which itself internally does an `\unskip`) and one bit of code (in `\@item`) even has two `\unskips` before a `\par`. These uses may be fossil code but if they are necessary, maybe `\@killglue` would be even safer.

Such removal of glue by `\unskip` may sometimes have the wrong result, removing not the glue from a space-token but other explicit glue; this is sometimes not what is intended.

A common way to prevent such removal is to add an `\hskip\z@` after the glue that should not be removed. This protects that glue against one `\unskip` with no test but not against more than one. It does work for ‘tested `\unskips`’. This is used by `\hspace*` but not by `\hspace`; this is inconsistent as the star is supposed to prevent removal only at the beginning of a line, not at the end, or in a tabular, etc.

If this reason for removing glue were the only consideration then a tested-`\unskip` and protection by `\hskip\z@` would suffice but would need to be consistently implemented.

However, the class of invisibles, commands and environments tries to be even cleverer: one of these tries to leave only one inter-word space whenever there is one before it and one after it; and it does this quite well.

But problems can arise when there is not a space-token on both sides of it; in particular, when an invisible appears at the beginning or end of a piece of text the method still leaves one space token whereas usually in these cases it should leave none.

Also, the current rules do not work well when more than one such command appears consecutively, separated by space-tokens; it leaves glue between every other invisible.

There is also a question about what these commands should do when they occur next to spaces that do not come from space tokens but, for example, from `\hspace`. Should they still produce ‘just one space’? If so, which one? It is good to note that the manual is sufficiently cautious about invisibles that we are not obliged to make anything work.

Another interesting side-road to explore is whether the space-tokens either side of an `\hspace{...}` should be ignored.

One alternative to the current algorithm that is often suggested is that all glue around the invisible should be consolidated into a space after it (usually without stating how much glue should be put there). The command `\nolinebreak` is implemented this way (and `\linebreak` should also be). This does not work correctly for the following common case:

```
... some text
\index{some-word}
some-word and more text.
```

This is optimal coding since it is normal to index a word that gets split across a page-break on its starting page. This would, on the other hand, fix another common (and documented) failure of the current system: when the invisible is the last thing in a paragraph the space before it is not removed and, worse, it is also hidden from the paragraph-ending mechanism so that an ‘empty’ line can be created at the end of the paragraph.

Another deficiency (I think) of the current system is that the following is treated as having the `\index` command between the paragraphs, which is probably not what the author intended (since there is no empty line after it).

```
\index{beginnings}
Beginnings of paragraphs ...
```

I know of no algorithm that will handle satisfactorily even all the most common cases; note that it could be that the best algorithm may be different for different invisibles since, for example, the common uses and expected behaviour of `\index`, `\marginpar`, `\linebreak`, `\pagebreak` and `\vspace` are somewhat different. [For example, is `\vspace` ever used in the middle of a paragraph?]

One method that can (and is) used to make invisible commands produce no space when used at the beginning of text is to put in some glue that is nearly enough the same as no glue or glue of zero length in all respects except for the precise test for not being exactly equal to zero; examples of such glue are `\hskip 1sp` and, possibly better but more complex, `\hskip -1sp \hskip 1sp`. However, this only works when it is known that user-supplied text is about to start.

Some similar concerns apply to the handling of space and penalties in vertical mode; there is an extra hurdle here as `\unskip` does not work on the main vertical list. The complexity of the tests done by `\addvspace` have never been explained.

The implementation of space hacks etc for vertical mode is another major area that needs further attention; my earlier experiments did not produce much improvement over the current unsatisfactory situation.

One particular problem is what happens when the following very natural coding is used (part of the problem here is that this looks like an hmode problem, but it is not):

```
... end of text.

\begin{enumerate}
  \item \label{item:xxx} Item text.
\end{enumerate}
```

1.3 Some immediate actions

- Fix bug in `\linebreak`.
- Fix bug in `*`.
- Reimplement `\\`, etc, removing extra `\adjusts` and getting better error trapping (this seems to involve a lot more tokens).
- Investigate whether `\\`, etc need to be errors in vmode; I think that they could be noops (maybe with a warning).
- Make all(?) `\unskips` include test for zero skip (rather than other tests or no test).
- Consider replacing `\hskip 1sp` by something better (here called an ‘infinitesimal’ skip).
- Look at all `\hskip\z@` (or similar) to see if they should be changed to an ‘infinitesimal’ skip.

- Resolve the inconsistency between `\hspace` and `\hspace*`.
- Remove unnecessary `\unskips`.
- Investigate and rationalise the ‘newline’ code.
- Find better algorithms for all sorts of things or, easier(?), fix T_EX itself.

1.4 The code

`\` The purpose of the new code is to fix a few bugs; however, it also attempts to optimize the following, in order of priority:

1. efficient execution of plain `\`;
2. efficient execution of `\[...]`;
3. memory use;
4. name-space use.

The changes should make no difference to the typeset output. It appears to be safe to use `\reserved@e` and `\reserved@f` here (other reserved macros are somewhat disastrous).

These changes made `\newline` even less robust than it had been, so now it is explicitly robust, like `\`.

The internal definition of the ‘normal’ definition of `\`.

```

(End definition for \@savsk and \@savsf.)

`\@bsphack` `\@bsphack` and `\@esphack` used by macros such as `\index` and `\begin{@float} ... \end{@float}` that want to be invisible — i.e., not leave any extra space when used in the middle of text. Such a macro should begin with `\@bsphack` and end with `\@esphack`. The macro in question should not create any text, nor change the mode.

Before giving the current definition we give an extended definition that is currently not used (because it doesn't work as advertised:-)

These are generalised hacks which attempt to do sensible things when 'invisible commands' appear in vmode too.

They need to cope with space in both hmode (plus spacefactor) and vmode, and also cope with breaks etc. In vmode this means ensuring that any following `\advspace`, etc sees the correct glue in `\lastskip`.

In fact, these improved versions should be used for other cases of 'whatsits, thingies etc' which should be invisible. They are only for commands, not environments (see notes on `\@Esphack`).

BTW, anyone know why the standard hacks are surrounded by `\ifmmode\else` rather than simply `\ifhmode`?

And are there any cases where saving the spacefactor is essential? I have some extensions where it is, but it does not appear to be so in the standard uses.

```
def \@bsphack{%
  \relax \ifvmode
    \@savsk \lastskip
    \ifdim \lastskip=\z@
    \else
      \vskip -\lastskip
    \fi
  \else
    \ifhmode
      \@savsk \lastskip
      \@savsf \spacefactor
    \fi
  \fi
}
```

I think that, in vmode, it is the safest to put in a `\nobreak` immediately after such things since writes, inserts etc followed by glue give valid breakpoints and, in general, it is possible to create breaks but impossible to destroy them.

```
def \@esphack{%
  \relax \ifvmode
    \nobreak
    \ifdim \@savsk=\z@
    \else
      \vskip \@savsk
    \fi
  \else
    \ifhmode
      \spacefactor \@savsf
      \ifdim \@savsk>\z@
        \ignorespaces
      \fi
    \fi
  \fi
}
```

```

\fi
\fi

```

For the moment we are going to ignore the vertical versions until they are correct.

```

125 \def\bsphack{%
126   \relax
127   \ifhmode
128     \@savsk\lastskip
129     \@savsf\spacefactor
130   \fi}

```

(End definition for \bsphack.)

\@esphack Companion to \bsphack. If this command is not properly paired with \bsphack one might end up with a low-level T_EX error: “BAD spacefactor”. One possible cause is calling \bsphack in vertical mode, then doing something that gets you (sometimes) into horizontal mode and finally calling \@esphack. Even if no error is generated that is wrong, because \@esphack will then use the saved values for \@savsk and \@savsf from some earlier invocation of \bsphack which will have nothing to do with the current situation.

\@vbsphack Another variant which is useful for invisible things which should not live in vmode (this is how some people feel about marginals).

If it occurs in vmode then it enters hmode and ensures that \@savsk is nonzero so that the \ignorespaces is put in later. It is not used at present.

```

\def \@vbsphack{ %
  \relax \ifvmode
    \leavevmode
    \@savsk 1sp
    \@savsf \spacefactor
  \else
    \ifhmode
      \@savsk \lastskip
      \@savsf \spacefactor
    \fi
  \fi
}

```

(End definition for \@vbsphack.)

1.5 Vertical spacing

L^AT_EX supports the plain T_EX commands \smallskip, \medskip and \bigskip. However, it redefines them using \vspace instead of \vskip.

Extra vertical space is added by the command \addvspace{<skip>}, which adds a vertical skip of <skip> to the document. The sequence \addvspace{<s1>} \addvspace{<s2>} is equivalent to \addvspace{<maximum of s1, s2>}.

\addvspace should be used only in vertical mode, and gives an error if it's not. The \addvspace command does *not* add vertical space if @minipage is true. The minipage environment uses this to inhibit the addition of extra vertical space at the beginning.

Penalties are put into the vertical list with the \addpenalty{<penalty>} command. It works properly when \addpenalty and \addvspace commands are mixed.

The @nobreak switch is set true used when in vertical mode and no page break should occur. (Right now, it is used only by the section heading commands to inhibit page breaking after a heading.)

```

\addvspace{SKIP} ==
BEGIN
  if vmode
    then if @minipage

```

```

        else if \lastskip =0
        then \vskip SKIP
        else if \lastskip < SKIP
            then \vskip -\lastskip
            \vskip SKIP
            else if SKIP < 0 and \lastskip >= 0
            then \vskip -\lastskip
            \vskip \lastskip + SKIP
        fi
    fi
else useful error message (CAR).
fi
END

```

1.6 Horizontal space (and breaks)

`\nobreakdashes` This idea is borrowed from the `amsmath` package but here we define a robust command. This command is a low-level command designed for use only before hyphens or dashes (such as `-`, `--`, or `---`).

It could probably be better implemented: it may need its own private token register and temporary command.

Setting the hyphen in a box and then unboxing it means that the normal penalty will not be added after it—and if the penalty is not there a break will not be taken (unless an explicit penalty or glue follows, thus the final `\nobreak`).

Note that even if it is not followed by a `'-`', it still leaves vmode and sets the spacefactor; so use it carefully!

```

406 \DeclareRobustCommand{\nobreakdashes}{%
407   \leavevmode
408   \toks@{}%
409   \def\reserved@a##1{\toks@\expandafter{\the\toks@-}%
410     \futurelet\@let@token \reserved@b}%
411   \def\reserved@b  {\ifx\@let@token -%
412     \expandafter\reserved@a

```

```

413             \else
414             \setbox\z@ \hbox{\the\toks@\nobreak}%
415             \unhbox\z@
416             \spacefactor\sfcode'\-
417             \fi}%
418 \futurelet\@let@token \reserved@b
419 }

```

(End definition for \nobreakdashes.)

\nobreakspace This is a robust command that produces a horizontal space at which, in paragraph-mode, a line-break is not possible. We then define an active ~ to expand to it since this is the documented behaviour of ~. One reason for introducing this is that some 8-bit input encodings have a slot for such a space and we do not want to use active characters as the L^AT_EX internal commands.

\@xobeysp

The braces in the definition of ~ are needed to ensure that a following space is preserved when reading to/from internal files.

We need to keep \@xobeysp as it is widely used; so here it is let to the non-robust command \nobreakspace .

```

420 \DeclareRobustCommand{\nobreakspace}{%
421   \leavevmode\nobreak\ }
422 \catcode '\~=13
423 \def~{\nobreakspace{}}
424 \expandafter\let\expandafter\@xobeysp\csname nobreakspace \endcsname

```

(End definition for \nobreakspace and \@xobeysp.)

\@ Placed before a '?', makes it a sentence-ending period. Does the right thing for other punctuation marks as well. Does this by setting spacefactor to 1000.

```

(End definition for \LaTeXe.)

File o

ltfiles.dtx

1 File Handling

The following user commands are defined in this part:

<code>\document</code>	(ie <code>\begin{document}</code>)
	Reads in the .AUX files and <code>\catcode</code> 's @ to 12.
<code>\nofiles</code>	Suppresses all file output by setting <code>\@files</code> false.
<code>\includeonly</code>	<code>{\NAME1, ... ,NAMEn}</code> Causes only parts NAME1, ... ,NAMEn to be read by their <code>\include</code> commands. Works by setting <code>partsw</code> true and setting <code>\@partlist</code> to NAME1, ... ,NAMEn.
<code>\include</code>	<code>{\NAME}</code> Does an <code>\input NAME</code> unless <code>\@partsw</code> is true and NAME is not in <code>\@partlist</code> . If <code>\@files</code> is true, then it directs .AUX output to NAME.AUX, including a checkpoint at the end.
<code>\input</code>	<code>{\NAME}</code> The same as TeX's <code>\input</code> , except it allows optional braces around the file name. In L ^A T _E X 2 _ε , it also avoids the primitive 'missing file' error, if the file can not be found.
<code>\IfFileExists</code>	<code>{\NAME}{\then}{\else}</code> If the file exists on the system, execute <i>then</i> otherwise execute <i>else</i> .
<code>\InputIfFileExists</code>	<code>{\NAME}{\then}{\else}</code> If the file exists on the system, execute <i>then</i> and input NAME otherwise execute <i>else</i> . <i>Historical L^AT_EX 2.09 comments (not necessarily accurate any more):</i>

```

1 {\*2kernel}
2 \message{files,}

```

VARIABLES, SWITCHES AND INTERNAL COMMANDS:

<code>\@mainaux</code>	: Output file number for main .AUX file.
<code>\@partaux</code>	: Output file number for current part's .AUX file.
<code>\@auxout</code>	: Either <code>\@mainout</code> or <code>\@partout</code> , depending on which .AUX file output goes to.
<code>\@input{foo}</code>	: If file foo exists, then <code>\input</code> 's it, otherwise types a warning message.
<code>@files</code>	: Switch – set false if no .AUX, .TOC, .IDX etc files are to be written
<code>@partsw</code>	: Set true by a <code>\includeonly</code> command.
<code>\@partlist</code>	: Set to the argument of the <code>\includeonly</code> command.
<code>\cp@F00</code>	: The checkpoint for <code>\include</code> 'd file FOO.TEX, written by <code>\@writeckpt</code> at the end of file FOO.AUX

```

\document

 11 </2ekernel>
 12 <latexrelease>\IncludeInRelease{2020/10/01}%
 13 <latexrelease> {\document}{Added hook to load l3backend code}%
 14 <*2ekernel | latexrelease>
 15 \def\document{%

We do cancel the grouping as part of the \begin handling (this is now done inside \begin instead) so that the env/<env>/begin hook is not hidden inside \begingroup ... \endgroup.

 16 % \endgroup

 17 \UseOneTimeHook{begindocument/before}%
 18 \@kernel@after@begindocument@before

Added hook to load l3backend code:

```

19 \expl@sys@load@backend@@
20 \ifx\@unusedoptionlist\@empty\else
21   \@latex@warning@no@line{Unused global option(s):^^J%
22     \spaces[\@unusedoptionlist]}%
23 \fi
24 \@colht\textheight
25 \@colroom\textheight \vsize\textheight
26 \columnwidth\textwidth
27 \@clubpenalty\clubpenalty
28 \if@twocolumn
29   \advance\columnwidth -\columnsep
30   \divide\columnwidth\tw@ \hsize\columnwidth \@firstcolumntrue
31 \fi
32 \hsize\columnwidth \linewidth\hsize
33 \begingroup\@floatplacement\@dblfloatplacement
34   \makeatletter\let\@writefile\@gobbletwo
35   \global \let \@multiplelabels \relax
36   \input{\jobname.aux}%
37 \endgroup
38 \if@files
39   \immediate\openout\@mainaux\jobname.aux
40   \immediate\write\@mainaux{\relax}%
41 \fi

```

Dateline 1991/03/26: FMi added `\process@table` to support NFSS; This will also work with old lfonts if no other style defines `\process@table`. The following line forces the initialization of the math fonts.

```

42 \process@table
43 \let\glb@currsiz\@empty % Force math initialization.
44 \normalsize
45 \everypar{}%

```

So that punctuation in headings is not disturbed by verbatim or other local changes to the space factor codes, save the document default here. This will be locally reset by the output routine. For special cases a class may want to define `\normalsfcodes` directly, in case that definition will be used. (This is an old bug, problem existed in L^AT_EX 2.0x and plain T_EX.)

```

46 \ifx\normalsfcodes\@empty
47   \ifnum\sfcode'\.=\@m
48     \let\normalsfcodes\frenchspacing
49   \else
50     \let\normalsfcodes\nonfrenchspacing
51   \fi
52 \fi

```

For similar reasons also save the default language, this will be reset locally in the output routine. In particular it allows hyphenation in the page head even if the page break happens in verbatim. If this has already been set by a package, set to the value of `\language` at this point.

```

53 \ifx\document@default@language\m@ne
54   \chardef\document@default@language\language
55 \fi

```

Way back in 1991 (08/26) FMi & RmS set the `\@noskipsec` switch to true in the preamble and to false here. This was done to trap lists and related text in the preamble but it does not catch everything; hence Change 1.1g was introduced.

```
56 \noskipsecfalse

57 \let \@refundefined \relax
```

Just before disabling the preamble commands we execute the begin document hook which contains any code contributed by `\AtBeginDocument`. Also disable the gathering of the file list, if no `\listfiles` has been issued. `\AtBeginDocument` is redefined at this point so that and such commands that get into the hook do not chase their tail...

```
58 \@kernel@before@begindocument
59 \UseOneTimeHook{begindocument}%
60 \@kernel@after@begindocument
```

Most of the following assignments will be done globally in case the user adds something like `\begin{multicols}` to the document hook, i.e. starts a group in `\begin{document}`.

Since a value of exactly 0pt for `\topskip` causes `\twocolumn` to misbehave, we add this check, hoping that it will not cause any problems elsewhere.

```
61 \ifdim\topskip<1sp\global\topskip 1sp\relax\fi
62 \global\@maxdepth\maxdepth
63 \global\let\@begindocumenthook\@undefined
64 \ifx\@listfiles\@undefined
65 \global\let\@filelist\relax
66 \global\let\@addtofilelist\@gobble
67 \fi
```

At the very end we disable all preamble commands. This has to happen after the begin document hooks was executed so that this hook can still use such commands.

```
68 \gdef\do##1{\global\let ##1\@notprerr}%
69 \@preamblecmds
```

The next line saves tokens and also allows `\@nodocument` to be used directly to trap preamble errors.

```
70 \global\let \@nodocument \relax
```

The next line is a pure safety measure in case a do list is ever expanded at the wrong place. In addition it will save a few tokens to get rid of the above definition.

```
71 \global\let\do\noexpand
72 \UseOneTimeHook{begindocument/end}%
```

Use of the hook might mean that we are already in horizontal mode, so ignore the space after `\begin{document}`.

```
73 \ignorespaces
```

The `begindocument` hook already existed in the kernel since 1994 under the name `\atbegindocumenthook` the additional ones are originally from the `etoolbox` package under the names `\@endpreamblehook` `\afterpreamble`.

```
74 \NewHook{begindocument}
75 \NewHook{begindocument/before}
76 \NewHook{begindocument/end}
```

```

\@kernel@after@begindocument@before
\@kernel@before@begindocument
\@kernel@after@begindocument

```

Above we used two kernel only hooks to be run after the public `begindocument/before` and after `begindocument` hooks.

In `\@kernel@after@begindocument@before` we already place one action: drop the fast execution code for the `env/document/begin` hook. That hook marks the end of the preamble and should therefore only be run once. In a normal document that is anyway the case (so the code would just sit there taking up space afterwards, which these days is rather harmless), however, in more complicated scenarios where several full documents are combined to a single document it might get applied several times with harmful effects. We therefore explicitly drop it at this point. the coding is somewhat obscure due to the name of the macro which requires constructing.

```

77 \edef \@kernel@after@begindocument@before {%
78   \let\expandafter\noexpand\csname
79     __hook env/document/begin\endcsname
80   \noexpand\@empty}

\normalsfcodes The setting of \@empty is just a flag. This command may be defined in a class or package file. If it is still \@empty at \begin{document} it will be defined to be \frenchspacing or \nonfrenchspacing, depending on which of those appears to be in effect at that point.

```
199 \let\normalsfcodes\@empty
```

(End definition for \normalsfcodes.)

\nofiles Set \@fileswfalse which suppresses the places where L^AT_EX makes \immediate writes. The \makeindex and \makeglossary are disabled. \protected@write is redefined not to write to the file specified, but rather to write a blank line to the log file. This ensures that a <whatsit> node is still created, and so spacing is not affected by the \nofiles command; to ensure this more generally, the \if@nobreak test is needed.

```

200 \def\nofiles{%
201   \@fileswfalse
202   \typeout{No auxiliary output files.^^J}%

213     \edef\reserved@a{\write#1{#3}}%
214     \reserved@a
215     \endgroup
216     \if@nobreak\ifvmode\nobreak\fi\fi
217 }

```

(End definition for `\protected@write`.)

```

218 \let\@auxout=\@mainaux

```

`\include` In the definition of `\include`, `\def\reserved@b` changed to `\edef\reserved@b` to be consistent with the `\edef` in `\includeonly`. (Suggested by Rainer Schöpf & Frank Mittelbach. Change made 20 Jul 88.)

Changed definition of `\include` to allow space at end of file name — otherwise, typing `\include{foo }` would cause L^AT_EX to overwrite `foo.tex`. Change made 24 May 89, suggested by Rainer Schöpf and Frank Mittelbach

Made `\include` check for being used inside an `\include`'d file, as this will not work and cause surprising results.

```

219 </2ekernel>
220 <*2ekernel | latexrelease>
221 <latexrelease> \IncludeInRelease{2020/10/01}%
222 <latexrelease> { \includeonly } { Spaces in file names } %
223 \def\include#1{\relax
224     \ifnum\@auxout=\@partaux
225         \@latex@error{\string\include\space cannot be nested}\@eha
226     \else

```

Here the normalization will add `.tex` for all files, (it uses the same normalization as the hooks), so we need to remove that manually. `\@strip@tex@ext` does that.

```

227     \set@curr@file{#1}%
228     \edef\@curr@file{\@strip@tex@ext\@curr@file}%

```

For historical reasons `\@include` expects an argument delimited by a space. This is kept (though unnecessary now) to avoid errors in other packages that use `\@include` directly.

```

229     \expandafter\@include\expandafter{\@curr@file} % deliberate space
230     \fi}

```

Here in `\includeonly` we also need to strip `.tex` after normalization:

```

231 \def\includeonly#1{%
232     \@partswtrue

```

Because the argument to `\includeonly` is a comma-separated list of filenames where there may be comma's preceding some of the filenames or trailing them. Therefore we need to take the list apart, remove the unwanted spaces while leaving the spaces *in* the filenames intact.

```

233     \let\@partlist\@empty
234     \@for\reserved@a:=#1 \do

```

```

235   {%
236     \expandafter\set@curr@file\expandafter{\reserved@a}%
237     \ifx\@partlist\@empty
238       \edef\@partlist{\@strip@tex@ext\@curr@file}%
239     \else
240       \edef\@partlist{\@partlist,\@strip@tex@ext\@curr@file}%
241     \fi
242   }%
243 }
244 \@onlypreamble\includeonly

```

(End definition for \include and \includeonly.)

\@strip@tex@ext These macros take a (\detokenized file name and remove any .tex extension). Extra
\@strip@tex@ext@aux care is taken to not remove the string .tex from the middle of a file name: it is only
removed if it's the very last thing in the file name.

```

```

(End definition for `\@charlb` and `\@charrb`.)

1.1 Safe Input Macros

`\@curr@file` File name handling is done by generating a `csname` from the provided file name (which
`\set@curr@file` means that UTF-8 octets gets turned into strings as this is what happens if they appear in a `csname` due to the code in `utf8.def`). By setting `\escapchar` to -1 we ensure that we don't get a backslash in front. As a result we end up with all characters as catcode 12 (plus spaces). We then sometimes add quotes around the construct (removing any existing inner quotes. Sometimes we only remove the quotes if they have been supplied by the user. There is clearly some room for improvement.

A side effect of the new code is that we will see quotes around file name displays where there haven't been any before.

For compatibility with existing code using `{abc}.tex` or `{one.two}.png`, an initial brace group is discarded before expansion and `\string` is applied. The content of the brace group is discarded. This means that a leading space will be lost unless protected (by `{ }` or `" "` or `\space`) but filenames with a space are hopefully rare.

The definition below is from 2019 and only used during kernel bootstrapping, later on in `ltfilehook.dtx` it will get overwritten.

```

390 \def\set@curr@file#1{%
391   \begingroup
392   \escapechar\m@ne
393   \xdef\@curr@file{%
394     \expandafter\expandafter\expandafter\unquote@name

531 <latexrelease>\EndIncludeInRelease
532 <*2ekernel>

```

(End definition for \@input.)

\@input Define `\@input` in terms of `\IfFileExists`. So this is a ‘safe input’ command, but the files input are not listed by `\listfiles`.

We don’t want `.aux`, `.toc` files etc be listed by `\listfiles`. However, something like `.bbl` probably should be listed and thus should be implemented not by `\@input`.

```

533 \def\@input#1{%
534   \IfFileExists{#1}{\@input\@filef@und}{\typeout{No file #1.}}

```

(End definition for \@input.)

\@input@ Version of `\@input` that does add the file to `\@filelist`.

```

535 \def\@input@#1{\InputIfFileExists{#1}{}{\typeout{No file #1.}}}

```

(End definition for \@input@.)

\@missingfileerror This ‘error’ command avoids T_EX’s primitive missing file loop.

Missing file error. Prompt for a new filename, offering a default extension.

Changes to `\@missingfileerror`: rather than trying to input the file by force, now `\@missingfileerror` just returns three `\@missingfile@<part>` and the caller macro is responsible for doing the right thing with it.

```

536 </2ekernel>
537 <*2ekernel | latexrelease>

\@obsoletefile For compatibility with L^AT_EX 2.09 document styles, we distribute files called `article.sty`, `book.sty`, `report.sty`, `slides.sty` and `letter.sty`. These use the command `\@obsoletefile`, which produces a warning message.

```

599 \def\@obsoletefile#1#2{%
600 \@latex@warning@no@line{inputting ‘#1’ instead of obsolete ‘#2’}}
601 \@onlypreamble\@obsoletefile

```

1.2 Listing files

A list of files input so far. The initial value of `\@gobble` eats the comma before the first file name.

```

602 \let\@filelist\@gobble

```

\@addtofilelist Add to the list of files input so far. This ‘real’ definition is only used for ‘cfg’ files during intex. An initial definition of `\@gobble` has already been set.

```

603 %\def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}

```

A preamble command to cause `\end{document}` to list files input from the main file.

```

\listfiles
604 \def\listfiles{%
605 \let\listfiles\relax
606 \def\@listfiles##1##2##3##4##5##6##7##8##9\@{%
607 \def\reserved@d{\}%
608 \@tfor\reserved@c:=##1##2##3##4##5##6##7##8\do{%
609 \ifx\reserved@c\reserved@d
610 \edef\filename@area{ \filename@area}%
611 \fi}}%

612 \def\@dofilelist{%
613 \typeout{^^J *File List*}%
614 \@for\@currname:=\@filelist\do{%
615 \filename@parse\@currname
616 \edef\reserved@a{%
617 \filename@base.%
618 \ifx\filename@ext\relax tex\else\filename@ext\fi}%
619 \expandafter\let\expandafter\reserved@b

```

```

620 \csname ver@\reserved@a\endcsname
621 \expandafter\expandafter\expandafter\@listfiles\expandafter

623 \typeout{%
624 \filename@area\reserved@a
625 \ifx\reserved@b\relax\else\@spaces\reserved@b\fi}%
626 \typeout{ *****~^J}}

```

The `\@filelist` will be de-activated if `\listfiles` does not appear in the preamble.
`\begin{document}` contains code equivalent to the following:

```

\AtBeginDocument{%
  \ifx\@listfiles\@undefined
    \let\@filelist\relax
    \let\@addtofilelist\@gobble
  \fi}
627 \@onlypreamble\listfiles

```

```

\@dofilelist 628 \let\@dofilelist\relax

```

```

629 </2ekernel>

```

(End definition for \obsoletefile and others.)

File p

ltoutenc.dtx

1 Font encodings

This section of the kernel contains commands for declaring encoding-specific commands, such as accents. It also contains the code for some of the encoding files, including `omlenc.def`, `omsenc.def`, `t1enc.def` and `ot1enc.def` files, which define the OLM, OMS, T1 and OT1 encodings, and the `fontenc` package for selecting encodings.

The `fontenc` package has options for encodings, of which the last option is the default encoding. For example, to use the OT2, OT3 and T1 encodings, with T1 as the default, you say:

```
\usepackage[OT2,OT3,T1]{fontenc}
```

The standard kernel set-up loads font encoding files and selects an encoding as follows.

```
\input {omlenc.def}
\input {t1enc.def}
\input {ot1enc.def}
\input {omsenc.def}
\fontencoding{OT1}
```

Note that the files in the standard `inputenc` package depend on this behaviour of the kernel.

The syntax for declaring encoding-specific commands is:

```
\DeclareTextCommand{<command>}{<encoding>}
                               [<number>] [<default>]{<commands>}
```

This command is like `\newcommand`, except that it defines a command which is specific to one encoding. The resulting command is always robust, even if its definition is fragile. For example, the definition of `\l` in the OT1 encoding is:

```
\DeclareTextCommand{\l}{OT1}{\@xxxii l}
```

`\DeclareTextCommand` takes the same optional arguments as `\newcommand`.

```
\ProvideTextCommand{<command>}{<encoding>}
                               [<number>] [<default>]{<commands>}
```

This acts like `\DeclareTextCommand`, but does nothing if the command is already defined.

```
\DeclareTextSymbol{<command>}{<encoding>}{<slot>}
```

This command defines a text symbol, with a particular slot in that encoding. The commands:

```
\DeclareTextSymbol{\ss}{OT1}{25}
\DeclareTextCommand{\ss}{OT1}{\char25 }
```

have the same effect, but the `\DeclareTextSymbol` is faster.

```
\DeclareTextAccent{<command>}{<encoding>}{<slot>}
```

This command declares a text accent. The commands:

```
\DeclareTextAccent{"}{OT1}{127}
\DeclareTextCommand{"}{OT1}{\add@accent {127}}
```

have the same effect.

```
\DeclareTextComposite{<command>}
                               {<encoding>}{<argument>}{<slot>}
```

This command declares a composite letter, for example in the T1 encoding `\'a` is slot 225, which is declared by:

```
\DeclareTextComposite{\'}{T1}{a}{225}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

`\DeclareTextComposite` is the most common example of using the more general declaration `\DeclareTextCompositeCommand`, which can define a composite to be an arbitrary piece of text.

```
\DeclareTextCompositeCommand{<command>}
                               {<encoding>}{<argument>}{<text>}
```

For example, in the OT1 encoding Å has a hand-crafted definition this is declared as follows

```
\DeclareTextCompositeCommand{\r}{OT1}{A}
{\leavevmode\setbox\z@\hbox{!}\dimen@ht\z@\advance\dimen@-1ex%
 \rlap{\raise.67\dimen@\hbox{\char23}}A}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

The commands defined using the above declarations can be used in two ways. Normally they are used by just calling the command in the appropriate encoding, for example `\ss`. However, sometimes you may wish to use a command in an encoding where it is not defined. If the command has no arguments, then you can use it in another encoding by calling `\UseTextSymbol`:

```
\UseTextSymbol{<encoding>}{<command>}
```

For example, `\UseTextSymbol{OT1}{\ss}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\ss}
```

If the command has one argument then you can use it in another encoding by calling `\UseTextAccent`:

```
\UseTextAccent{<encoding>}{<command>}{<text>}
```

For example, if the current encoding is OT2 then `\UseTextAccent{OT1}{\'}{a}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\'{\fontencoding{OT2}\selectfont a}}
```

You can also declare a default definition for a text command, which will be used if the current encoding has no appropriate definition. Such use will also set the definition for this command in the current encoding to equal this default definition; this makes subsequent uses of the command much faster.

```
\DeclareTextCommandDefault{<command>}{<definition>}
```

For example, the default definition of the command `\textonequarter` (which produces the fraction $\frac{1}{4}$) could be built using math mode:

```
\DeclareTextCommandDefault{\textonequarter}{\ensuremath {\frac{1}{4}}}
```

There is a matching `\Provide` command which will not override an existing default definition:

```
\ProvideTextCommandDefault{<command>}{<definition>}
```

The most common use for these commands is to use symbols from other encodings, so there are some optimizations provided:

```
\DeclareTextSymbolDefault{<command>}{<encoding>}
\DeclareTextAccentDefault{<command>}{<encoding>}
```

are short for:

```
\DeclareTextCommandDefault{<command>}
      {\UseTextSymbol{<encoding>}{<command>}}
\DeclareTextCommandDefault[1]{<command>}
      {\UseTextAccent{<encoding>}{<command>}{#1}}
```

For example, to make OT1 the default encoding for `\ss` and `\'` you say:

```
\DeclareTextSymbolDefault{\ss}{OT1}
\DeclareTextAccentDefault{\'}{OT1}
```

Note that you can use these commands on any zero- or one-argument commands declared with `\DeclareText*` or `\ProvideText*`, not just those defined using `\DeclareTextSymbol` or `\DeclareTextAccent`.

1.1 Removing encoding-specific commands

In some cases encoding definitions are given to provide some limited support since nothing better is available, for example, the definition for `\textdollar` in OT1 is a hack since \$ and £ actually share the same slot in this encoding. Thus if such a glyph becomes available in a different encoding (e.g., TS1) one would like to get rid of the flaky one and make the default definition point to the new encoding. In such a case defining

```
\DeclareTextSymbol{\textdollar}{TS1}{36}
\DeclareTextSymbolDefault{\textdollar}{TS1}
```

is not enough since if typesetting in OT1 L^AT_EX will still find the encoding specific-definition for OT1 and therefore ignore the new default. Therefore to ensure that in this case the TS1 version is used we have to remove the OT1 declaration:

```
\UndeclareTextCommand{\textdollar}{OT1}
```

Since the \$ sign is a proper glyph in the T1 encoding there is no point removing its definition and forcing L^AT_EX to pick up the TS1 version if typesetting in this encoding. However, assume you want to use the variant dollar sign, i.e., \$ for your dollars. In that case you have to get rid of the T1 declaration as well, e.g., the following would do that for you:

```
\UndeclareTextCommand{\textdollar}{OT1}
\UndeclareTextCommand{\textdollar}{T1}
\DeclareTextCommandDefault{\textdollar}
{\UseTextSymbol{TS1}\textdollaroldstyle}
```

1.2 The order of declarations

If an encoding-specific command is defined for more than one encoding, then it will execute fastest in the encoding in which it was defined last since its top-level definition will be set up to execute in that encoding without any overhead.

For this reason the file `fonttext.ltx` currently first loads the definitions for the T1 encoding and then those for the OT1 encoding so that typesetting in OT1 is optimized since that is (still) the default. However, when T1 is explicitly requested (via `\usepackage[T1]{fontenc}`) the top-level definitions are automatically changed to favour T1 since its declarations are reloaded in the process.

For the same reason default declarations should never come last since they are implemented as a special encoding themselves (with the name ?). Specifying them last would simply mean to make those encoding-specific commands equally inefficient in all encodings. Therefore the `textcomp` package, for example, first sets up all defaults to point to TS1 and then declares the commands in the TS1 encoding.

1.3 Docstrip modules

This `.dtx` file is be used to generate several related files containing font encoding definitions. The mutually exclusive docstrip options are listed here.

T1	generates <code>t1enc.def</code> for the Cork encoding.
TS1	generates <code>ts1enc.def</code> for the Text Companion encoding.
TS1sty	generates <code>textcomp.sty</code> , package that sets up use of the Text Companion encoding.
OT1	generates <code>ot1enc.def</code> for Knuth's CM encoding.
OMS	generates <code>omsenc.def</code> for Knuth's math symbol encoding.
OML	generates <code>omlenc.def</code> for Knuth's math letters encoding.
OT4	generates <code>ot4enc.def</code> for the Polish extension to the OT1 encoding, created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete.
TU	generates <code>tuenc.def</code> for Unicode font encoding.
package	generates <code>fontenc.sty</code> for selecting encodings.
2ekernel	for the kernel commands.

1.4 Definitions for the kernel

1.4.1 Declaration commands

This section contains definitions for commands such as accents which depend on the current encoding. These commands will usually be kept in `.def` files, for example `ot1enc.def` contains the definitions for the OT1 encoding.

```
1 <*2ekernel>
2 \message{font encodings,}

Far too many macros in one block here!
```

```
\DeclareTextCommand
\ProvideTextCommand
\DeclareTextSymbol
  \@dec@text@cmd
\chardef@text@cmd
  \@changed@cmd
  \@changed@x
\TextSymbolUnavailable
  \@inmathwarn

If you say:
  \DeclareTextCommand{\foo}{T1}...

then \foo is defined to be \T1-cmd \foo \T1\foo, where \T1\foo is one control sequence, not two! We then call \newcommand to define \T1\foo.

3 \def\DeclareTextCommand{%
4   \@dec@text@cmd\newcommand}
5 \def\ProvideTextCommand{%
6   \@dec@text@cmd\providecommand}
7 \def\@dec@text@cmd#1#2#3{%
8   \expandafter\def\expandafter#2%
9     \expandafter{%
10      \csname#3-cmd\expandafter\endcsname
11      \expandafter#2%
12      \csname#3\string#2\endcsname
13    }%
14   \let\@ifdefinable\@rc@ifdefinable
15   \expandafter#1\csname#3\string#2\endcsname}
```

This command was introduced to fix a major bug in `\@dec@text@cmd` without changing that command itself. This was thought to be necessary because it is defined in more than one package. (Perhaps the more serious bug is to put complex low-level commands like this in packages?)

The problem it solves is that whereas both `\newcommand` and `\providecommand` (used just above) both handle the resetting of `\@ifdefinable` (following its disabling in `\@dec@text@cmd`), the primitive `\chardef` neither needs the disabling, nor does the resetting.

```
16 \def\chardef@text@cmd{%
17   \let\@ifdefinable\@@ifdefinable
18   \chardef
19 }
20 \def\DeclareTextSymbol#1#2#3{%
21   \@dec@text@cmd\chardef@text@cmd#1{#2}#3\relax
22 }
```

The declarations are only available before `\begin{document}`.

```
23 \@onlypreamble\DeclareTextCommand
24 \@onlypreamble\DeclareTextSymbol
```

The sneaky bit in all this is what `\T1-cmd \foo \T1\foo` does. There are five possibilities, depending on the current values of `\protect`, `\cf@encoding` and `\ifmmode`:

- If `\protect` is `\@typeset@protect` and `\cf@encoding` is T1, then we execute `\T1\foo`. This should be the normal behaviour, and is optimized for speed.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, and `\OT1\foo` is defined, then we execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, we're in text mode, and `\OT1\foo` is undefined, then we define `\OT1\foo` to be the default value of `\foo`, and execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, we're in math mode, and `\OT1\foo` is undefined, then we execute the default value of `\foo`. (This is necessary so that things like `X_\copyright` work properly.)
- If `\protect` is not `\@typeset@protect` then we execute `\noexpand\foo`. For example, if we are writing to a file, then this results in `\foo` being written. If we are in a `\mark`, then `\foo` will be put in the mark—since `\foo` is robust, it will then survive all the things which may happen to it whilst it's a `\mark`.

So after all that, we will either execute the appropriate definition of `\foo` for the current encoding, or we will execute `\noexpand\foo`.

The default value of `\foo` is `\?\foo` if it is defined, and an error message otherwise.

When the encoding is changed from T1 to OT1, `\T1-cmd` is defined to be `\@changed@cmd` and `\OT1-cmd` is defined to be `\@current@cmd`. This means that the test for what the current encoding is can be performed quickly.

```

25 \def\@current@cmd#1{%
26   \ifx\protect\@typeset@protect
27     \inmathwarn#1%
28   \else
29     \noexpand#1\expandafter\@gobble
30   \fi}

31 \def\@changed@cmd#1#2{%
32   \ifx\protect\@typeset@protect
33     \inmathwarn#1%
34     \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
35       \expandafter\ifx\csname ?\string#1\endcsname\relax
36         \expandafter\def\csname ?\string#1\endcsname{%
37           \TextSymbolUnavailable#1%
38         }%
39       \fi
40       \global\expandafter\let
41         \csname\cf@encoding\string#1\expandafter\endcsname
42         \csname ?\string#1\endcsname
43     \fi
44     \csname\cf@encoding\string#1%
45       \expandafter\endcsname
46   \else
47     \noexpand#1%
48   \fi}

49 \gdef\TextSymbolUnavailable#1{%
50   \@latex@error{%
51     Command \protect#1 unavailable in encoding \cf@encoding%
52   }\@eha}

```

The command `\@inmathwarn` produces a warning message if we are currently in math mode. Note that since this command is used inside text commands, it can't call `\relax` before the `\ifmmode`. This means that it is possible for the warning to fail to be issued at the beginning of a row of an `halign` whose template enters math mode. This is probably a bad feature, but there's not much that can be done about it, since adding a `\relax` would break ligatures and kerning between text symbols.

A more efficient solution would be to make `\@inmathwarn` and `\@inmatherr` equal to `\@empty` and `\relax` by default, and to have `\everymath` reset them to their usual definitions. This is left for future investigation (for example it may break some third party code).

```
53 \def\@inmathwarn#1{%
54   \ifmmode
55     \@latex@warning{Command \protect#1 invalid in math mode}%
56   \fi}
```

(End definition for \DeclareTextCommand and others.)

`\DeclareTextCommandDefault`
`\ProvideTextCommandDefault`

These define commands with encoding ?.

Note that `\DeclareTextCommandDefault` can only be used in the preamble, but that the `\Provide` version is allowed in inputenc .def files, so is allowed anywhere.

```
57 \def\DeclareTextCommandDefault#1{%
58   \DeclareTextCommand#1?}

59 \def\ProvideTextCommandDefault#1{%
60   \ProvideTextCommand#1?}

61 \@onlypreamble\DeclareTextCommandDefault
62 %\@onlypreamble\ProvideTextCommandDefault
```

They require `\? -cmd` to be initialized as `\@changed@cmd`.

```
63 \expandafter\let\csname?-cmd\endcsname\@changed@cmd
```

(End definition for \DeclareTextCommandDefault and \ProvideTextCommandDefault.)

`\DeclareTextAccent`

This is just a disguise for defining a T_EX `\accent` command.

```
64 \def\DeclareTextAccent#1#2#3{%
65   \DeclareTextCommand#1{#2}{\add@accent{#3}}}

66 \@onlypreamble\DeclareTextAccent
```

(End definition for \DeclareTextAccent.)

`\add@accent`

To save space this code is shared between all text accents that are set using the `\accent` primitive. The argument is pre-set in a box so that any font loading that is needed is already done within the box. This is needed because font-loading involves grouping and that would prevent the accent mechanism from working so that the accent would not be positioned over the argument. Declarations that change the font should be allowed (only low-level ones are at present) inside the argument of an accent command, but not size changes, as they involve `\setbox` operations which also inhibit the mechanism of the `\accent` primitive.

Note that the whole process is within a group. For a detailed discussion of this reimplementaion and its deficiencies, see pr/3160.

```
67 \def\add@accent#1#2{\hmode@bgroup
```

Turn off the group in `\UseTextSymbol` in case this is used inside the argument of `\add@accent`.

```
68 \let\hmode@start@before@group\@firstofone
69 \setbox\@tempboxa\hbox{#2}
```

When presetting the argument in a box we record its `\spacefactor` for later use after the accent got typeset. This way something like `\‘A` gets the spacefactor of `A` (i.e., 999) rather than the default value of 1000.

```
70 \global\mathchardef\accent@spacefactor\spacefactor}%
```

The accent primitive doesn't allow things `\begingroup` to interfere between accent and base character. Therefore we need to avoid that (they are some hidden inside `\maybe@load@fontshape`). As we don't have to load the fontshape in this case (as that happened in the box above if necessary, we simply disable that part of the code temporarily. We also ignore `\ignorespaces` which has the same issue and may show up as part of `\normalfont` if that is used.

```
71 \let\maybe@load@fontshape\relax
72 \let\ignorespaces\relax
73 \accent#1 #2\egroup\spacefactor\accent@spacefactor}
```

Default definition for `\accent@spacefactor` prevents a horrible death of the above macro inside an unprotected `\edef`.

```
74 \let\accent@spacefactor\relax
```

(End definition for `\add@accent`.)

`\hmode@bgroup`

```
75 \def\hmode@bgroup{\leavevmode\bgroup}
```

(End definition for `\hmode@bgroup`.)

`\DeclareTextCompositeCommand` Another amusing game to play with `\expandafter`, `\csname`, and `\string`. When you say `\DeclareTextCompositeCommand{\foo}{T1}{a}{bar}`, we look to see if the expansion of `\T1\foo` begins with `\@text@composite`, and if it doesn't, we redefine `\T1\foo` to be:

```
\@text@composite
\@text@composite@x
\@strip@args
#1 -> \@text@composite \T1\foo #1\@empty \@text@composite {...}
```

where `...` is the previous definition of `\T1\foo`. Finally, we define `\T1\foo-a` to expand to `bar`.

```

123 <latexrelease>\EndIncludeInRelease
124 <*2ekernel>
125 \@onlypreamble\DeclareTextCompositeCommand

```

This all works because:

```
\@text@composite \T1\foo A\@empty \@text@composite {...}
```

expands to `\T1\foo-A` if `\T1\foo-A` has been defined, and `{...}` otherwise.

Note that `\@text@composite` grabs the first token of the argument and puts just that in the csname. This is so that `\'\textit{e}` will work—it checks whether `\T1\'-\textit` is defined (which presumably it isn't) and so expands to `\accent 1 \textit{e}`.

This trick won't always work, for example `\'\itshape e` will expand to (with spaces added for clarity):

```
\csname \string \T1\' - \string {\itshape e} \@empty \endcsname
```

which will die pretty horribly. Unfortunately there's not much can be done about this if we're going to use `\csname` lookups as a fast way of accessing composites.

This has an unfortunate 'misfeature' though, which is that in the T1 encoding, `\'aa` produces á. This is not the expected behaviour, and should perhaps be fixed if the fix doesn't affect performance too badly.

Finally, it's worth noting that the `\@empty` is used in `\@text@composite` so that accents will work even when the argument is empty. If you say `\'{}` then this looks up `\T1\'-\@empty`, which ought to be `\relax`, and so all is well. If we didn't include the `\@empty`, then `\'{}` would expand to:

```
\csname \string \T1\' - \string \endcsname
```

so the `\endcsname` would be `\string'ed` and the whole of the rest of the document would be put inside the `\csname`. This would not be good.

```
126 \def\@text@composite#1#2#3\@text@composite{%
127   \expandafter\@text@composite@x
128     \csname\string#1-\string#2\endcsname}
```

Originally the `\@text@composite@x` macro had two arguments and if `#1` was not `\relax` it was executed, otherwise `#2` was executed. All this happened within the `\ifx` code so that neither `#1` nor `#2` could have picked up any additional arguments from the input stream. This has now been changed using the typical `\@firstoftwo / \@secondoftwo` coding. This way the final expansion will happen without any `\else` or `\fi` intervening in the case that we need to get a further token from the input stream.

```
129 \def\@text@composite@x#1{%
130   \ifx#1\relax
131     \expandafter\@secondoftwo
132   \else
133     \expandafter\@firstoftwo
134   \fi
135   #1}
```

The command `\DeclareTextComposite` uses `\DeclareTextCompositeCommand` to declare a command which expands out to a single glyph.

```
136 \catcode\z@=11\relax
137 \def\DeclareTextComposite#1#2#3#4{%
138   \def\reserved@a{\DeclareTextCompositeCommand#1{#2}{#3}}%
139   \bgroup
140     \lccode\z@#4%
141     \lowercase{%
142   \egroup
143     \reserved@a ^^@}}
144 \catcode\z@=15\relax
145 \@onlypreamble\DeclareTextComposite
(End definition for \DeclareTextCompositeCommand and others.)
146 </2ekernel>
147 <*2ekernel | latexrelease>
148 <latexrelease>\IncludeInRelease{2019/10/01}%
149 <latexrelease>          {\UseTextAccent}{Make commands robust}}%
```

`\UseTextAccent` These fragile commands access glyphs from different encodings. They use grotty low-level calls to the font selection scheme for speed, and in order to make sure that `\UseTextSymbol` doesn't do anything which you're not allowed to do between an `\accent` and its glyph.

`\@use@text@encoding`

For a detailed discussion of this reimplementaion and its deficiencies, see pr/3160.

```

150 \DeclareRobustCommand*\UseTextAccent[3]{%
151   \hmode@start@before@group
152   {%

```

Turn off the group in `\UseTextSymbol` in case this is used inside the arguments of `\UseTextAccent`.

```

153   \let\hmode@start@before@group\@firstofone
154   \let\@curr@enc\cf@encoding
155   \@use@text@encoding{#1}%
156   #2{\@use@text@encoding\@curr@enc#3}%
157   }}

158 \DeclareRobustCommand*\UseTextSymbol[2]{%
159   \hmode@start@before@group
160   {%
161     \def\@wrong@font@char{\MessageBreak
162       for \noexpand\symbol'\string#2'}%
163     \@use@text@encoding{#1}%
164     #2%
165   }%
166   }

167 </2ekernel | latexrelease>
168 <latexrelease>\EndIncludeInRelease
169 <latexrelease>\IncludeInRelease{0000/00/00}%
170 <latexrelease>      {\UseTextAccent}{Make commands robust}%
171 <latexrelease>
172 <latexrelease>\kernel@make@fragile\UseTextAccent
173 <latexrelease>\kernel@make@fragile\UseTextSymbol
174 <latexrelease>
175 <latexrelease>\EndIncludeInRelease
176 <*2ekernel>

```

Switch to a different text encoding without any grouping for use in `\UseTextAccent` or `\UseTextSymbol` (and for `\oldstylenums`).

```

177 \def\@use@text@encoding#1{%
178   \edef\f@encoding{#1}%
179   \xdef\font@name{%
180     \csname\curr@fontshape/\f@size\endcsname}%
181   \pickup@font
182   \font@name
183   \@@enc@update}

```

(End definition for `\UseTextAccent`, `\UseTextSymbol`, and `\@use@text@encoding`.)

`\hmode@start@before@group` The `\hmode@start@before@group` starts hmode and should be immediately followed by an explicit `{...}`. Its purpose is to ensure that hmode is started before this group is opened. Inside `\add@accent` and `\UseTextAccent` it is redefined to remove this group so that it doesn't conflict with the `\accent` primitive.

For a detailed discussion see pr/3160.

```

184 \let\hmode@start@before@group\leavevmode

```

(End definition for `\hmode@start@before@group`.)

`\DeclareTextSymbolDefault` Some syntactic sugar. Again, these should probably be optimized for speed.

```
\DeclareTextAccentDefault
185 \def\DeclareTextSymbolDefault#1#2{%
186   \DeclareTextCommandDefault#1{\UseTextSymbol{#2}#1}}
187 \def\DeclareTextAccentDefault#1#2{%
188   \DeclareTextCommandDefault#1{\UseTextAccent{#2}#1}}
189 \@onlypreamble\DeclareTextSymbolDefault
190 \@onlypreamble\DeclareTextAccentDefault
```

(End definition for \DeclareTextSymbolDefault and \DeclareTextAccentDefault.)

`\UndeclareTextCommand` This command safely removes an encoding specific declaration for a given encoding. It is helpful if one intends to use the default definition always and therefore wants to get rid of a declaration for some specific encoding.

```
191 \def\UndeclareTextCommand#1#2{%
If there is no declaration for the current encoding do nothing. (This makes a hash table
entry but without eTeX we can't do anything about that).
192   \expandafter\ifx\csname#2\string#1\endcsname\relax
193   \else
```

Else: throw away that declaration.

```
194     \global\expandafter\let\csname#2\string#1\endcsname
195     \undefined
```

But this is unfortunately not enough, we have to take a look at the top-level definition of the encoding specific command which for a command `\foo` would look similar to `\T1-cmd \foo \T1\foo` (three tokens).

Of course, instead of `T1` one could see a different encoding name; which one depends the encoding for which `\foo` was declared last.

Now assume we have just removed the declaration for `\foo` in `T1` and the top-level of `\foo` expands to the above. Then we better change that pretty fast otherwise we do get an “undefined csname error” when we try to typeset `\foo` within `T1` instead of getting the default definition for `\foo`. And what is the best way to change that top-level definition? Well, the only “encoding” we know for sure will still be around is the default encoding denoted by `?`.

Thus in case the last token of the top-level expansion is now undefined we change the declaration to look like `\?-cmd \foo \?\foo` which is done by the following (readable?) code:

```
196   \expandafter\expandafter\expandafter
197   \ifx\expandafter\@thirdofthree#1\@undefined
198     \expandafter\gdef\expandafter#1\expandafter
199     {\csname ?-cmd\expandafter\endcsname\expandafter
200      #1\csname?\string#1\endcsname}%
201   \fi
202   \fi
203 }
```

```
204 \@onlypreamble\UndeclareTextCommand
```

(End definition for \UndeclareTextCommand.)

1.4.2 Hyphenation

`\patterns` We redefine `\patterns` and `\hyphenation` to allow the use of commands declared with
`\@@patterns` `\DeclareText*` to be used inside them.
`\hyphenation`
`\@@hyphenation`

```

205 %\let\@@patterns\patterns
206 %\let\@@hyphenation\hyphenation
207 %\def\patterns{%
208 %   \bgroup
209 %     \let\protect\@empty
210 %     \let\@typeset@protect\@empty
211 %     \let\@changed@x\@changed@x@mouth
212 %   \afterassignment\egroup
213 %   \@@patterns
214 %}
215 %\def\hyphenation{%
216 %   \bgroup
217 %     \let\protect\@empty
218 %     \let\@typeset@protect\@empty
219 %     \let\@changed@x\@changed@x@mouth
220 %   \afterassignment\egroup
221 %   \@@hyphenation
222 %}

```

(End definition for `\patterns` and others.)

1.4.3 Miscellanea

`\a` The `\a` command is used to access the accent commands even when they have been redefined (for example by the `\tabbing` environment). Its internal name is `\@tabacckludge`.
 The `\string` within the `\csname` guards against something like `'` being active at the point of use.

```

223 \def\@tabacckludge#1{\expandafter\@changed@cmd
224                                     \csname\string#1\endcsname\relax}
225 \let\a=\@tabacckludge

```

(End definition for `\a`.)

1.4.4 Default encodings

We define the default encodings for most commands to be either OT1, OML or OMS. These defaults are in the kernel and therefore fonts with these encodings must be available unless these defaults are redefined elsewhere. Recall that the standard kernel loads the encoding files for these encodings, and also that for the T1 encoding.

The naming conventions in the kernel are not what we would use if we were starting from scratch... Those defined by DEK (like `\ae` and `\ss`) or by the T_EX Users Group Technical Working Group on multi-lingual typesetting (like `\th` and `\ng`) have short names. Those which were added to the kernel in 1993 and early 1994 are named after their Adobe glyph names (like `\guillemotleft` and `\quotedblbase`). Unfortunately, this naming scheme won't work for all glyphs, since some names (like `\space`) are already used, and some (like `\endash`) are very likely to be defined by users. So we're now using the naming scheme of `\text` followed by the Adobe name, (like `\textendash` and `\textsterling`). Except that some glyphs don't have Adobe names, so we're using the names used by fontinst for those (like `\textcompwordmark`). Sigh.

Some accents from OT1:

```
226 \DeclareTextAccentDefault{"}{OT1}
227 \DeclareTextAccentDefault{'}{OT1}
228 \DeclareTextAccentDefault{.}{OT1}
229 \DeclareTextAccentDefault{=}{OT1}
230 \DeclareTextAccentDefault{H}{OT1}
231 \DeclareTextAccentDefault{^}{OT1}
232 \DeclareTextAccentDefault{'}{OT1}
233 \DeclareTextAccentDefault{b}{OT1}
234 \DeclareTextAccentDefault{c}{OT1}
235 \DeclareTextAccentDefault{d}{OT1}
236 \DeclareTextAccentDefault{r}{OT1}
237 \DeclareTextAccentDefault{u}{OT1}
238 \DeclareTextAccentDefault{v}{OT1}
239 \DeclareTextAccentDefault{~}{OT1}
```

Some symbols from OT1:

```
240 %\DeclareTextSymbolDefault{AA}{OT1}
241 \DeclareTextSymbolDefault{AE}{OT1}
242 \DeclareTextSymbolDefault{L}{OT1}
243 \DeclareTextSymbolDefault{OE}{OT1}
244 \DeclareTextSymbolDefault{O}{OT1}
245 %\DeclareTextSymbolDefault{aa}{OT1}
246 \DeclareTextSymbolDefault{ae}{OT1}
247 \DeclareTextSymbolDefault{i}{OT1}
248 \DeclareTextSymbolDefault{j}{OT1}

249 \DeclareTextSymbolDefault{ij}{OT1}
250 \DeclareTextSymbolDefault{IJ}{OT1}

251 \DeclareTextSymbolDefault{l}{OT1}
252 \DeclareTextSymbolDefault{oe}{OT1}
253 \DeclareTextSymbolDefault{o}{OT1}
254 \DeclareTextSymbolDefault{ss}{OT1}
255 \DeclareTextSymbolDefault{textdollar}{OT1}
256 \DeclareTextSymbolDefault{textemdash}{OT1}
257 \DeclareTextSymbolDefault{textendash}{OT1}
258 \DeclareTextSymbolDefault{textexclamdown}{OT1}
259 %\DeclareTextSymbolDefault{texthyphenchar}{OT1}
260 %\DeclareTextSymbolDefault{texthyphen}{OT1}
261 \DeclareTextSymbolDefault{textquestiondown}{OT1}
262 \DeclareTextSymbolDefault{textquotedblleft}{OT1}
263 \DeclareTextSymbolDefault{textquotedblright}{OT1}
264 \DeclareTextSymbolDefault{textquoteleft}{OT1}
265 \DeclareTextSymbolDefault{textquoteright}{OT1}
266 \DeclareTextSymbolDefault{textsterling}{OT1}
```

Some symbols from OMS:

```
267 \DeclareTextSymbolDefault{textasteriskcentered}{OMS}
268 \DeclareTextSymbolDefault{textbackslash}{OMS}
269 \DeclareTextSymbolDefault{textbar}{OMS}
270 \DeclareTextSymbolDefault{textbardbl}{OMS}
271 \DeclareTextSymbolDefault{textbraceleft}{OMS}
272 \DeclareTextSymbolDefault{textbraceright}{OMS}
273 \DeclareTextSymbolDefault{textbullet}{OMS}
```

```

274 \DeclareTextSymbolDefault{\textdaggerdbl}{OMS}
275 \DeclareTextSymbolDefault{\textdagger}{OMS}
276 \DeclareTextSymbolDefault{\textparagraph}{OMS}
277 \DeclareTextSymbolDefault{\textperiodcentered}{OMS}
278 \DeclareTextSymbolDefault{\textsection}{OMS}
279 \DeclareTextAccentDefault{\textcircled}{OMS}

```

Some symbols from OML:

```

280 \DeclareTextSymbolDefault{\textless}{OML}
281 \DeclareTextSymbolDefault{\textgreater}{OML}
282 \DeclareTextAccentDefault{\t}{OML}

```

Some defaults we can fake.

The interface for defining `\copyright` changed, it used to use `\expandafter` to add braces at the appropriate points.

```

283 \DeclareTextCommandDefault{\textcopyright}{\textcircled{c}}
284 % \expandafter\def\expandafter
285 % \copyright\expandafter{\expandafter{\copyright}}

286 \DeclareTextCommandDefault{\textasciicircum}{\~{}}
287 \DeclareTextCommandDefault{\textasciitilde}{\~{}}
288 \DeclareTextCommandDefault{\textunderscore}{%
289 \leavevmode \kern.06em\vbox{\hrule\@width.3em}}

```

There is no good reason anymore to fake `\textcompwordmark`.

```

290 %\DeclareTextCommandDefault{\textcompwordmark}{\leavevmode\kern\z@}
291 \DeclareTextSymbolDefault{\textcompwordmark}{T1}

292 \DeclareTextCommandDefault{\textvisiblespace}{%
293 \mbox{\kern.06em\vrule \@height.3ex}%
294 \vbox{\hrule \@width.3em}%
295 \hbox{\vrule \@height.3ex}}

```

Using `\fontdimen3` in the next definition is some sort of a kludge (since it is the interword stretch) but it makes the ellipsis come out right in mono-spaced fonts too (since there it is zero).

```

296 \DeclareTextCommandDefault{\textellipsis}{%
297 .\kern\fontdimen3\font
298 .\kern\fontdimen3\font
299 .\kern\fontdimen3\font}

300 %\DeclareTextCommandDefault{\textregistered}{\textcircled{\scshape r}}
301 \DeclareTextCommandDefault{\textregistered}{\textcircled{%
302 \check@mathfonts\fontsize\sf@size\z@\math@fontsfalse\selectfont R}}
303 \DeclareTextCommandDefault{\texttrademark}{\textsuperscript{TM}}
304 \DeclareTextCommandDefault{\SS}{SS}

305 \DeclareTextCommandDefault{\textordfeminine}{\textsuperscript{a}}
306 \DeclareTextCommandDefault{\textordmasculine}{\textsuperscript{o}}

```

1.4.5 Math material

Some commands can be used in both text and math mode:

```
307 \DeclareRobustCommand{\$}{\ifmmode\mathdollar\else\textdollar\fi}
```

We use `\protected` not `\DeclareRobustCommand` so that `\bigl\{` etc. works inside `\protected@edef`.

```
308 \protected\def{{\ifmmode\lbrace\else\textbraceleft\fi}
```

```
309 \protected\def\}{\ifmmode\rbrace\else\textbraceright\fi}
```

```
310 \DeclareRobustCommand{\P}{\ifmmode\mathparagraph\else\textparagraph\fi}
```

```
311 \DeclareRobustCommand{\S}{\ifmmode\mathsection\else\textsection\fi}
```

```
312 \DeclareRobustCommand{\dag}{\ifmmode{\dagger}\else\textdagger\fi}
```

```
313 \DeclareRobustCommand{\ddag}{\ifmmode{\ddagger}\else\textdaggerdbl\fi}
```

For historical reasons `\copyright` needs `{}` around the definition in maths.

```
314 \DeclareRobustCommand{\_}{%
```

```
315   \ifmmode\nfss@text{\textunderscore}\else\textunderscore\fi}
```

```
316 \DeclareRobustCommand{\copyright}{%
```

```
317   \ifmmode{\nfss@text{\textcopyright}}\else\textcopyright\fi}
```

```
318 \DeclareRobustCommand{\pounds}{%
```

```
319   \ifmmode\mathsterling\else\textsterling\fi}
```

```
320 \DeclareRobustCommand{\dots}{%
```

```
321   \ifmmode\mathellipsis\else\textellipsis\fi}
```

```
322 \let\ldots\dots
```

Default definition of the `commabelow` accent.

```
323 </2ekernel>
```

```
324 <latexrelease>\IncludeInRelease{2015/10/01}{\textcommabelow}{comma accent}}%
```

```
325 <*2ekernel | latexrelease>
```

```
326 \DeclareTextCommandDefault\textcommabelow[1]
```

```
327   {\hmode\bgroup\oalign{\null#1\cr\hidewidth\raise-.31ex
```

```
328     \hbox{\check@mathfonts\fontsize\ssf@size\z@
```

```
329     \math@fontsfalse\selectfont,}\hidewidth}\egroup}
```

```
330 <latexrelease>\EndIncludeInRelease
```

```
331 </2ekernel | latexrelease>
```

```

1.5 Definitions for the OT1 encoding

The definitions for the ‘T_EX text’ (OT1) encoding.

Declare the encoding.

```

376 <*OT1>
377 \DeclareFontEncoding{OT1}{-}{-}

```

Declare the accents.

```

378 \DeclareTextAccent{"}{OT1}{127}
379 \DeclareTextAccent{'}{OT1}{19}
380 \DeclareTextAccent{.}{OT1}{95}
381 \DeclareTextAccent{=}{OT1}{22}
382 \DeclareTextAccent{^}{OT1}{94}
383 \DeclareTextAccent{'}{OT1}{18}
384 \DeclareTextAccent{\~}{OT1}{126}
385 \DeclareTextAccent{\H}{OT1}{125}
386 \DeclareTextAccent{\u}{OT1}{21}
387 \DeclareTextAccent{\v}{OT1}{20}
388 \DeclareTextAccent{\r}{OT1}{23}

```

Some accents have to be built by hand: Note that `\ooalign` and `\o@lign` must be inside a group. In these definitions we no longer use the helper function `\sh@ft` from `plain.tex` since that now has two incompatible definitions.

```

389 \DeclareTextCommand{\b}{OT1}[1]
390   {\hmode\bgroup\o@lign{\relax#1\crrcr\hidewidth\ltx@sh@ft{-3ex}}%

```

```

391 \vbox to.2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
392 \DeclareTextCommand{\c}{OT1}[1]
393 {\leavevmode\setbox\z@\hbox{#1}\ifdim\ht\z@=1ex\accent24 #1%
394 \else\oalign{\unhbox\z@\crrc\hidewidth\char24\hidewidth}}\fi}
395 \DeclareTextCommand{\d}{OT1}[1]
396 {\hmode\bgroup
397 \oalign{\relax#1\crrc\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}

```

Declare the text symbols.

```

398 \DeclareTextSymbol{\AE}{OT1}{29}
399 \DeclareTextSymbol{\OE}{OT1}{30}
400 \DeclareTextSymbol{\O}{OT1}{31}
401 \DeclareTextSymbol{\ae}{OT1}{26}
402 \DeclareTextSymbol{\i}{OT1}{16}
403 \DeclareTextSymbol{\j}{OT1}{17}
404 \DeclareTextSymbol{\oe}{OT1}{27}
405 \DeclareTextSymbol{\o}{OT1}{28}
406 \DeclareTextSymbol{\ss}{OT1}{25}
407 \DeclareTextSymbol{\textendash}{OT1}{124}
408 \DeclareTextSymbol{\textdash}{OT1}{123}

```

The `\nobreak\hskip\z@` is there to prevent a break after the hyphen but allow later breaks in the remainder of the word.

```

409 \DeclareTextCommand{\textnonbreakinghyphen}{OT1}{\mbox{-}\nobreak\hskip\z@}
410 \DeclareTextCommand{\textfiguredash}{OT1}{\textendash}
411 \DeclareTextCommand{\texthorizontalbar}{OT1}{\textdash}

```

Using the ligatures helps with OT1 fonts that have `\textexclamdown` and `\textquestiondown` in unusual positions.

```

412 %\DeclareTextSymbol{\textexclamdown}{OT1}{60}
413 %\DeclareTextSymbol{\textquestiondown}{OT1}{62}
414 \DeclareTextCommand{\textexclamdown}{OT1}{\!'}
415 \DeclareTextCommand{\textquestiondown}{OT1}{\?' }
416 %\DeclareTextSymbol{\texthyphenchar}{OT1}{'\-}
417 %\DeclareTextSymbol{\texthyphen}{OT1}{'\-}
418 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
419 \DeclareTextSymbol{\textquotedblright}{OT1}{'\"}
420 \DeclareTextSymbol{\textquoteleft}{OT1}{'\'}
421 \DeclareTextSymbol{\textquoteright}{OT1}{'\'}

```

Some symbols which are faked from others:

```

422 % \DeclareTextCommand{\aa}{OT1}
423 % {\accent23a}
424 \DeclareTextCommand{\L}{OT1}
425 {\leavevmode\setbox\z@\hbox{L}\hb@xt@\wd\z@{\hss\@xxxii L}}
426 \DeclareTextCommand{\l}{OT1}
427 {\hmode\bgroup\@xxxii l\egroup}
428 % \DeclareTextCommand{\AA}{OT1}
429 % {\leavevmode\setbox\z@\hbox{h}\dimen@ht\z@\advance\dimen@-1ex%
430 % \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

In the OT1 encoding Å has a hand-crafted definition, so we have here the first recorded explicit use of `\DeclareTextCompositeCommand`.

```

431 \DeclareTextCompositeCommand{\r}{OT1}{A}
432 {\leavevmode\setbox\z@\hbox{!}\dimen@ht\z@\advance\dimen@-1ex%
433 \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefor we fake it for the OT1 encoding.

```

434 \DeclareTextCommand{\ij}{OT1}{%
435   \nobreak\hskip\z@skip i\kern-0.02em j\nobreak\hskip\z@skip}
436 \DeclareTextCommand{\IJ}{OT1}{%
437   \nobreak\hskip\z@skip I\kern-0.02em J\nobreak\hskip\z@skip}

```

In the OT1 encoding, £ and \$ share a slot.

```

438 \DeclareTextCommand{\textdollar}{OT1}{\hmode@bgroup
439   \ifdim \fontdimen\@ne\font >\z@
440     \slshape
441   \else
442     \upshape
443   \fi
444   \char‘\$ \egroup}

445 \DeclareTextCommand{\textsterling}{OT1}{\hmode@bgroup
446   \ifdim \fontdimen\@ne\font >\z@
447     \itshape
448   \else
449     \fontshape{ui}\selectfont
450   \fi
451   \char‘$ \egroup}

```

Here we are adding some more composite commands to the OT1 encoding. This makes the use of certain accents with i compatible with their use with the T1 encoding; this enables them to become true L^AT_EX internal representations. However, it will make these accents work a little less fast since a check will always be made for the existence of a composite.

```

452 \DeclareTextComposite{\.}{OT1}{i}{‘\i}
453 \DeclareTextComposite{\.}{OT1}{i}{‘\i}
454 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge‘\i}
455 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge‘\i}
456 \DeclareTextCompositeCommand{\~}{OT1}{i}{\^{\i}}
457 \DeclareTextCompositeCommand{\~}{OT1}{i}{\^{\i}}

```

T1 encoding is given more extensive set of overloads for \c But here we just adjust \c{g}.

```

458 \ifx\textcommaabove\undefined\else
459 \DeclareTextCompositeCommand{\c}{OT1}{g}{\textcommaabove{g}}
460 \fi
461 </OT1>

```

1.6 Definitions for the T1 encoding

The definitions for the ‘Extended T_EX text’ (T1) encoding.

Declare the encoding.

```

462 <*T1>
463 \DeclareFontEncoding{T1}{\}{}

```

Declare the accents.

```

464 \DeclareTextAccent{\'}{T1}{0}
465 \DeclareTextAccent{\'}{T1}{1}
466 \DeclareTextAccent{\~}{T1}{2}

```

```

467 \DeclareTextAccent{\~}{T1}{3}
468 \DeclareTextAccent{\"}{T1}{4}
469 \DeclareTextAccent{\H}{T1}{5}
470 \DeclareTextAccent{\r}{T1}{6}
471 \DeclareTextAccent{\v}{T1}{7}
472 \DeclareTextAccent{\u}{T1}{8}
473 \DeclareTextAccent{\=}{T1}{9}
474 \DeclareTextAccent{\.}{T1}{10}

```

Some accents have to be built by hand. Note that `\ooalign` and `\oalign` must be inside a group. In these definitions we no longer use the helper function `\sh@ft` from `plain.tex` since that now has two incompatible definitions.

```

475 \DeclareTextCommand{\b}{T1}[1]
476   {\hmode\bgroup\oalign{\relax#1\crrc\hidewidth\ltx@sh@ft{-3ex}%
477     \vbox to.2ex{\hbox{\char9}\vss}\hidewidth}\egroup}
478 \DeclareTextCommand{\c}{T1}[1]
479   {\leavevmode\setbox\z@\hbox{#1}\ifdim\ht\z@=1ex\accent11 #1%
480     \else{\ooalign{\unhbox\z@\crrc
481       \hidewidth\char11\hidewidth}}\fi}
482 \DeclareTextCommand{\d}{T1}[1]
483   {\hmode\bgroup
484     \oalign{\relax#1\crrc\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}
485 \DeclareTextCommand{\k}{T1}[1]
486   {\hmode\bgroup\ooalign{\null#1\crrc\hidewidth\char12}\egroup}
487 \DeclareTextCommand{\textogonekcentered}{T1}[1]
488   {\hmode\bgroup\ooalign{%
489     \null#1\crrc\hidewidth\char12\hidewidth}\egroup}

```

Some symbols are constructed.

Slot 24 contains a small circle intended for construction of these two glyphs.

```

490 \DeclareTextCommand{\textperthousand}{T1}
491   {\%\char 24 } % space or 'relax as delimiter?
492 \DeclareTextCommand{\textpertenthousand}{T1}
493   {\%\char 24\char 24 } % space or 'relax as delimiter?

```

For Maltese, `\Hwithstroke` and `\hwithstroke` are needed.

```

494 \DeclareTextCommand{\Hwithstroke}{T1}
495   {%
496     \hmode\bgroup
497     \vphantom{H}%
498     \sbox\z@{H}%
499     \ooalign{%
500       H\cr
501       \hidewidth
502       \vrule
503         height \dimexpr 0.7\ht\z@+0.1ex\relax
504         depth -0.7\ht\z@
505         width 0.8\wd\z@
506       \hidewidth\cr
507     }%
508     \egroup
509   }
510 \DeclareTextCommand{\hwithstroke}{T1}
511   {%

```

```

512 \hmode@bgroup
513 \vphantom{h}%
514 \sbox\z@{h}%
515 \ooalign{%
516   h\cr
517   \kern0.075\wd\z@
518   \vrule
519     height \dimexpr 0.7\ht\z@+0.1ex\relax
520     depth  -0.7\ht\z@
521     width  0.4\wd\z@
522   \hidewidth\cr
523 }%
524 \egroup
525 }

```

733 \char 13 % "0D

```

```

734     }%
735     \egroup}
736   </OMS>

```

1.8 Definitions for the OML encoding

The definitions for the ‘T_EX math italic’ (OML) encoding. Even though this is meant to be a math font, it includes some of the standard L^AT_EX text symbols.

Declare the encoding.

```

737 <*OML>
738 \DeclareFontEncoding{OML}{-}{-}

```

Declare the symbols.

```

739 \DeclareTextSymbol{\textless}{OML}{'\<}
740 \DeclareTextSymbol{\textgreater}{OML}{'\>}
741 \DeclareTextAccent{\t}{OML}{127} % "7F
742 </OML>

```

1.9 Definitions for the OT4 encoding

These definitions are for the Polish extension to the ‘T_EX text’ (OT1) encoding. This encoding was created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete. In positions 0–127 it is identical to OT1 but it contains some additional characters in the upper half. The L^AT_EX support was developed by Mariusz Olko.

The PL fonts that use it are available as follows:

Metafont sources <ftp://ftp.gust.org.pl/TeX/language/polish/pl-mf.zip>;

Font files <ftp://ftp.gust.org.pl/TeX/language/polish/pl-tfm.zip>.

Declare the encoding.

```

743 <*OT4>
744 \DeclareFontEncoding{OT4}{-}{-}
745 \DeclareFontSubstitution{OT4}{cmr}{m}{n}

```

Declare the accents.

```

746 \DeclareTextAccent{"}{OT4}{127}
747 \DeclareTextAccent{'}{OT4}{19}
748 \DeclareTextAccent{.}{OT4}{95}
749 \DeclareTextAccent{=}{OT4}{22}
750 \DeclareTextAccent{~}{OT4}{94}
751 \DeclareTextAccent{'}{OT4}{18}
752 \DeclareTextAccent{~}{OT4}{126}
753 \DeclareTextAccent{H}{OT4}{125}
754 \DeclareTextAccent{u}{OT4}{21}
755 \DeclareTextAccent{v}{OT4}{20}
756 \DeclareTextAccent{r}{OT4}{23}

```

The ogonek accent is available only under a e A & E. But we have to provide some definition for \k. Some other accents have to be built by hand as in OT1:

```

757 \DeclareTextCommand{\k}{OT4}[1]{%
758   \TextSymbolUnavailable{\k{#1}}#1}

```

In these definitions we no longer use the helper function `\sh@ft` from `plain.tex` since that now has two incompatible definitions.

```

759 \DeclareTextCommand{\b}{OT4}[1]
760   {\hmode\bgroup\o@lign{\relax#1\cr cr\hidewidth\ltx@sh@ft{-3ex}%

862 \DeclareTextSymbol{\textdollar}{TS1}{36}
863 \DeclareTextSymbol{\textquotesingle}{TS1}{39}

```

"28 = 40

The symbol `\textasteriskcentered` “*” is supposed to be always available in `TS1` and that is important as it is used in footnote symbols. However, in a few fonts it is missing even though they are otherwise fairly complete. We therefore use a rather elaborate method and check if the slot has a glyph and if not produce a poor man’s version by using a normal “*” slightly enlarged and somewhat lowered. The main application for this symbol is in footnote symbols and there it should produce a comparable size and show a similar placement.

```

864 %\DeclareTextSymbol{\textasteriskcentered}{TS1}{42} % that's wanted
865 \DeclareTextCommand \textasteriskcentered{TS1}{%    % and that's needed
866   \iffontchar\font 42 \char42 \else
867   \begingroup\fontencoding{T1}%
868     \fontsize

```

```

869      {\the\dimexpr1.3\dimexpr\fontsize pt\relax}%
870      {\font@baselineskip}%
871      \selectfont

1.11 Definitions for the TU encoding

The TU encoding was originally introduced in the contributed package `fontspec` as a Unicode encoding for XeTeX and LuaTeX.

Normally for these engines, the input consists of Unicode characters encoded in UTF-8. There is therefore little need to use the traditional (ASCII) encoding-specific commands

However, sometimes (e.g. for backwards compatibility) it can be useful to access these Unicode characters via such ASCII-based markup. The commands provided here cover the characters in the T1 and TS1 encodings, but specified in Unicode position. Almost all the command names have been mechanically extracted from the `inputenc` UTF-8 support, which is essentially doing a reverse mapping from UTF-8 data to L^AT_EX LICR commands.

A few additional names for character which were supported in the original `fontspec` version of this file have also been added, even though they are not currently in the default `inputenc` UTF-8 declarations.

```
980 ⟨*TU⟩
```

In the base interface the Unicode encoding is always known as TU. But we parameterize the encoding name to allow for modelling differences in Unicode support by different fonts.

```
981 \providecommand\UnicodeEncodingName{TU}
```

As the Unicode encoding, TU, is only currently available with XeTeX or LuaTeX, we detect these engines first, and make adjustments for the differing font loading syntax. For other engines, we issue a warning then abort this file, switching back to T1 encoding.

```
982 \begingroup\expandafter\expandafter\expandafter\endgroup
```

```
983 \expandafter\ifx\csname XeTeXrevision\endcsname\relax
```

```
984 \begingroup\expandafter\expandafter\expandafter\endgroup
```

```
985 \expandafter\ifx\csname directlua\endcsname\relax
```

Not LuaTeX or XeTeX, abort with a warning.

```
986 \PackageWarningNoLine{fontenc}
```

```
987 {\UnicodeEncodingName\space
```

```
988 encoding is only available with XeTeX and LuaTeX.\MessageBreak
```

```
989 Defaulting to T1 encoding}
```

```
990 \def\encodingdefault{T1}
```

```
991 \expandafter\expandafter\expandafter\endinput
```

```
992 \else
```

LuaTeX. For LuaTeX 1.10+, define a Lua function to disable any handing by the font code. Otherwise we reload the font without TeX ligatures.

```
993 \def\UnicodeFontTeXLigatures{+tlig;}
```

```
994 \ifnum\luatexversion<110
```

```
995 \def\reserved@a#1{%
```

```
996 \def\@remove@tlig##1{\@remove@tlig@##1\@nil#1\@nil\relax}
```

```
997 \def\@remove@tlig@##1#1{\@remove@tlig@##1}}
```

```
998 \edef\reserved@b{\detokenize{+tlig;}}
```

```
999 \expandafter\reserved@a\expandafter{\reserved@b}
```

```
1000 \def\@remove@tlig@##1\@nil#2\relax{#1}
```

```

1001 \def\remove@tlig#1{%
1002 \begingroup
1003 \font\remove@tlig
1004 \expandafter\@remove@tlig\expandafter{\fontname\font}%
1005 \remove@tlig
1006 \char#1\relax
1007 \endgroup
1008 }
1009 \else
1010 \newluafunction\@remove@tlig@@@

```

Now we can define the function. Mostly we just have to insert a protected glyph node, which is a glyph node with subtype 256. But we have to keep track of the current mode to avoid inserting the glyph into a vlist.

```

1011 \now@and@everyjob{\directlua{
1012   local rawchar_func = token.create'\@remove@tlig@@@'.index
1013   local forcehmode = tex.forcehmode
1014   local put_next = token.put_next
1015   local glyph_id = node.id'glyph'
1016   local rawchar_token = token.new(rawchar_func, token.command_id'lua_call')
1017   lua.get_functions_table()[rawchar_func] = function()
1018     local mode = tex.nest.top.mode
1019     if mode == 1 or mode == -1 then
1020       put_next(rawchar_token)
1021       return forcehmode(true)
1022     end
1023     local n = node.new(glyph_id, 256)
1024     n.font = font.current()
1025     n.char = token.scan_int()
1026     return node.write(n)
1027   end
1028   token.set_lua('\@remove@tlig@@@', rawchar_func, 'global', 'protected')
1029 }}

```

Now `\remove@tlig` can be implemented almost as in XeTeX.

```

Unfortunately some fonts do not implement "2011, "2012 and/or "2015 (including the
LATEX default fonts for Unicode engines) so we provide some approximations if the glyph
is missing, like we do for OT1 and T1.

The \nobreak\hskip\z@ is there to prevent a break after the hyphen but allow later
breaks in the remainder of the word.

2 Package files

This file now also contains some packages that provide access to the more specialised encodings.

2.1 The fontenc package

This package allows authors to specify which encodings they will use. For each encoding **F00**, the package looks to see if the encoding **F00** has already been declared. If it has not, the file **fooenc.def** is loaded. The default encoding is set to be **F00**.

In addition the package at the moment contains extra code to extend the **\@uclclist** (list of upper/lower case pairs) for encodings that involve cyrillic characters. **THIS IS A TEMPORARY SOLUTION** and will not stay this way forever (or so we hope) but right now we are missing a proper interface for this and didn't wanted to rush it.

```

1490 <*package>

```

Here we define a macro that extends the `\@uclclist` if needed and afterwards turns itself in a noop.

```

1491 \def\update@uclc@with@cyrillic{%
1492 \expandafter\def\expandafter\@uclclist\expandafter

1517 \cyrzhdsc\CYRZHDSC}%
1518 \let\update@uclc@with@cyrillic\relax
1519 }

```

Here we process each option:

```

1521 \DeclareOption*{%
1522 \let\encodingdefault\CurrentOption

```

From 2020/02/02 release onward we only load the encoding files if they haven't be loaded already. To check this we look if `\T@encoding` is already defined. If not we load (indicated by setting the switch `@tempswa` to true and we always load if we run in an older format (or rather in a rollback situation).

```

1523 \@tempswafalse
1524 \@ifl@t@r\fmtversion{2020/02/02}%
1525 {\expandafter\ifx\csname T@\CurrentOption\endcsname\relax
1526 \@tempswatrue}%
1527 {\@tempswatrue}%

```

Load if necessary:

```

1528 \if@tempswa
1529 \edef\reserved@f{%
1530 \lowercase{\def\noexpand\reserved@f{\CurrentOption enc.def}}}%
1531 \reserved@f
1532 \InputIfFileExists\reserved@f
1533 {\PackageError{fontenc}%

```

```

1534         {Encoding file ‘\reserved@f’ not found.%
1535         \MessageBreak
1536         You might have misspelt the name of the encoding}%
1537     {Necessary code for this encoding was not
1538     loaded.\MessageBreak
1539     Thus calling the encoding later on will
1540     produce further error messages.}}%
1541 \let\reserved@f\relax

```

In case the current encoding is one of a list of known cyrillic ones we extend the `\@uclclist`:

```

1542     \expandafter\in@\expandafter{\CurrentOption}%
1543                                     {T2A,T2B,T2C,X2,LCY,OT2}%
1544 \ifin@

```

But only if it hasn’t already been extended. This might happen if there are several calls to fontenc loading one of the above encodings. If we don’t do this check the `\@uclclist` gets unnecessarily big, slowing down the processing at runtime.

```

1545     \expandafter\in@\expandafter\cyr@\expandafter
1546                                     {\@uclclist}%
1547 \ifin@
1548 \else
1549     \update@uclc@with@cyrillic
1550 \fi
1551 \fi
1552 \fi
1553 }

```

```

1554 \ProcessOptions*

```

We select the new font encoding default (i.e., the last encoding specified in the option list. But this encoding may not work with the current `\f@shape`, e.g., `LY1` is not defined for `cmr` and therefore packages switching to `LY1` usually also change `\rmdefault`. But that only applies at `\begin{document}` so we get a spurious warning if we use what L^AT_EX previously used:

```

1555 %\fontencoding\encodingdefault\selectfont

```

So instead we do this here:

```

1556 \usefont\encodingdefault\familydefault\seriesdefault\shapedefault

```

To save some space we get rid of the macro extending the `\@uclclist` (might have happened already).

```

1557 \let\update@uclc@with@cyrillic\relax

```

Finally we pretend that the fontenc package wasn’t read in. This allows for using it several times, e.g., in a class file and in the preamble (at the cost of not getting any version info). That kind of hackery shows that using a general purpose package just for loading an encoding is not the right kind of interface for setting up encodings — it will get replaced at some point in the future.

```

1558 \let\@elt\relax
1559 \xdef\@fontenc@load@list{\@fontenc@load@list
1560     \@elt{\csname opt@fontenc.sty\endcsname}}

```

```

1561 \global\expandafter\let\csname ver@fontenc.sty\endcsname\relax
1562 \global\expandafter\let\csname opt@fontenc.sty\endcsname\relax
1563 \global\let\@ifl@ter@@\@ifl@ter
1564 \def\@ifl@ter#1#2#3#4#5{\global\let\@ifl@ter\@ifl@ter@@}
1565 \end{package}

```

File q

ltcounts.dtx

1 Counters and Lengths

Commands for defining and using counters. This file defines:

<code>\newcounter</code>	To define a new counter.
<code>\setcounter</code>	To set the value of counters.
<code>\addtocounter</code>	Increase the counter #1 by the number #2 .
<code>\stepcounter</code>	Increase a counter by one.
<code>\refstepcounter</code>	Increase a counter by one, also setting the value used by <code>\label</code> .
<code>\value</code>	For accessing the value of the counter as a TeX number (as opposed to <code>\the<counter></code> which expands to the <i>printed</i> representation of <code><counter></code>)
<code>\arabic</code>	<code>\arabic{<counter>}</code> : 1, 2, 3, ...
<code>\roman</code>	<code>\roman{<counter>}</code> : i, ii, iii, ...
<code>\Roman</code>	<code>\Roman{<counter>}</code> : I, II, III, ...
<code>\alph</code>	<code>\alph{<counter>}</code> : a, b, c, ...
<code>\Alph</code>	<code>\Alph{<counter>}</code> : A, B, C, ...
<code>\fnsymbol</code>	<code>\fnsymbol{<counter>}</code> : *, †, ‡, ...
<code>\counterwithin</code>	<code>\counterwithin{<counter>}{<within-counter>}</code> : Resets <code><counter></code> whenever <code><within-counter></code> is stepped. Also redefines <code>\the<counter></code> command to produce <code>\the<within-counter>.\arabic{<counter>}</code> . Star form omits redefining the print representation.
<code>\counterwithout</code>	<code>\counterwithout{<counter>}{<within-counter>}</code> : Removes <code><counter></code> from the reset list of <code><within-counter></code> . Also redefines <code>\the<counter></code> command to produce <code>\arabic{<counter>}</code> . Star form omits redefining the print representation.

1 (*2ekernel)

1.1 Environment Counter Macros

An environment foo has an associated counter defined by the following control sequences:

<code>\c@foo</code>	Contains the counter's numerical value. It is defined by <code>\newcount\foocounter</code> .
<code>\thefoo</code>	Macro that expands to the printed value of <code>\foocounter</code> . For example, if sections are numbered within chapters, and section headings look like Section II-3. The Nature of Counters then <code>\thesection</code> might be defined by: <code>\def\thesection</code> <code>{\@Roman{\c@chapter}-\@arabic{\c@section}}</code>
<code>\p@foo</code>	Macro that expands to a printed 'reference prefix' of counter foo. Any <code>\ref</code> to a value created by counter foo will produce the expansion of <code>\p@foo\thefoo</code> when the <code>\label</code> command is executed. See file <code>ltxref.dtx</code> for an extension of this mechanism.
<code>\cl@foo</code>	List of counters to be reset when foo stepped. Has format <code>\@elt{countera}\@elt{counterb}\@elt{counterc}</code> .

NOTE:

`\thefoo` and `\p@foo` *must* be defined in such a way that `\edef\bar{\thefoo}` or `\edef\bar{\p@foo}` defines `\bar` so that it will evaluate to the counter value at the

time of the `\edef`, even after `\foocounter` and any other counters have been changed. This will happen if you use the standard commands `\@arabic`, `\@Roman`, etc.

The following commands are used to define and modify counters.

`\refstepcounter{<foo>}`

Same as `\stepcounter`, but it also defines `\@currentreference` so that a subsequent `\label{<bar>}` command causes `\ref{<bar>}` to generate the current value of counter `<foo>`.

`\@definecounter{<foo>}`

Initializes counter `{<foo>}` (with empty reset list), defines `\p@foo` and `\thefoo` to be null. Also adds `<foo>` to `\cl@ckpt` – the reset list of a dummy counter `@ckpt` used for taking checkpoints for the `\include` system.

`\@addtoreset{<foo>}{<bar>}` : Adds counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\@removefromreset{<foo>}{<bar>}` : Removes counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\setcounter` `\setcounter{<foo>}{<val>}` : Globally sets `\foocounter` equal to `<val>`.

```
2 \def\setcounter#1#2{%
3   \@ifundefined{c@#1}%
4     {\@nocounterr{#1}}%
5     {\global\csname c@#1\endcsname#2\relax}}
```

(End definition for `\setcounter`.)

`\addtocounter` `\addtocounter{<foo>}{<val>}` Globally increments `\foocounter` by `<val>`.

```
6 \def\addtocounter#1#2{%
7   \@ifundefined{c@#1}%
8     {\@nocounterr{#1}}%
9     {\global\advance\csname c@#1\endcsname #2\relax}}
```

(End definition for `\addtocounter`.)

`\newcounter` `\newcounter{<newctr>}[<oldctr>]` Defines `<newctr>` to be a counter, which is reset when counter `<oldctr>` is stepped. If `<newctr>` already defined produces ‘`c@newctr` already defined’ error.

```
10 \def\newcounter#1{%
11   \expandafter\@ifdefinable \csname c@#1\endcsname
12     {\@definecounter{#1}}%
13   \@ifnextchar[{\@newctr{#1}}{-}]}
```

(End definition for `\newcounter`.)

`\value` `\value{<ctr>}` produces the value of counter `<ctr>`, for use with a `\setcounter` or `\addtocounter` command.

```
14 \def\value#1{\csname c@#1\endcsname}
```

(End definition for `\value`.)

`\@newctr`

```
15 \def\@newctr#1[#2]{%
16   \@ifundefined{c@#2}{\@nocounterr{#2}}{\@addtoreset{#1}{#2}}}
```

(End definition for `\@newctr`.)

`\stepcounter` `\stepcounterfoo` Globally increments counter `\c@F00` and resets all subsidiary counters.

```

17 \def\stepcounter#1{%
18   \addtocounter{#1}\@ne
19   \begingroup
20     \let\@elt\@stpelt
21     \csname cl@#1\endcsname
22   \endgroup}

```

(End definition for \stepcounter.)

`\@stpelt` Rather than resetting the “within” counter to zero we set it to -1 and then run `\stepcounter` that moves it to 0 and also initiates resetting the next level down.

(End definition for \@Alph.)

\@fnsymbol \@fnsymbol Typesetting old fashioned footnote symbols. This can be done both in text or math mode
now.

```

This macro is another example of an ever recurring problem in T_EX: Determining if something is text-mode or math-mode. It is imperative for the decision between text and math to be delayed until the actual typesetting is done as the code in question may go through an `\edef` or `\write` where an `\ifmmode` test would be executed prematurely. Hence in the implementation below, `\@fnsymbol` is not robust in itself but the parts doing the actual typesetting are.

In the case of `\@fnsymbol` we make use of the robust command `\TextOrMath` which takes two arguments and typesets the first if in text-mode and the second if in math-mode. Note that in order for this command to make the correct decision, it must insert a `\relax` token if run under regular T_EX, which ruins any kerning between the preceding characters and whatever awaits typesetting. If you use eT_EX as engine for L^AT_EX (as recommended) this unfortunate side effect is not present.

```

126 </2ekernel>

148 <latexrelease>\EndIncludeInRelease
149 <*2ekernel>

```

(End definition for \@fnsymbol.)

\TextOrMath When using regular T_EX, we make this command robust so that it always selects the correct branch in an `\ifmmode` switch with the usual disadvantage of ruining kerning. For the application we use it for here that shouldn't matter. The alternative would be to mimic `\IeC` from `inputenc` but then it will have the disadvantage of choosing the wrong branch if appearing at the beginning of an alignment cell. However, users of eT_EX will be pleasantly surprised to get the best of both worlds and no bad side effects.

First some code for checking if we are running eT_EX but making sure not to permanently turn `\protected` into `\relax`.

```

150 </2ekernel>
151 <latexrelease>\IncludeInRelease{2015/01/01}{\TextOrMath}{\TextOrMath}%
152 <*2ekernel | latexrelease>
153 \begingroup\expandafter\expandafter\expandafter\endgroup
154 \expandafter\ifx\csname protected\endcsname\relax

```

In case of ordinary T_EX we define `\TextOrMath` as a robust command but make sure it always grabs its arguments. If we didn't do this it might very well gobble spaces in the input stream.

```

155 \DeclareRobustCommand\TextOrMath{%
156   \ifmmode \expandafter\@secondoftwo
157   \else \expandafter\@firstoftwo \fi
158 \protected@edef\TextOrMath#1#2{\TextOrMath{#1}{#2}}
159 \else

```

For eT_EX the situation is similar. The robust macro is a hidden one so that we again avoid problems of gobbling spaces in the input.

```

160 \protected\expandafter\def\csname TextOrMath\space\endcsname{%
161   \ifmmode \expandafter\@secondoftwo

```

```

162 \else \expandafter\@firstoftwo \fi}
163 \edef\TextOrMath#1#2{%
164 \expandafter\noexpand\csname TextOrMath\space\endcsname

```

`\@settopoint` This macro takes the contents of the skip register that is supplied as its argument and removes the fractional part to make it a whole number of points. This can be used in class files to avoid values like 345.4666666pt when calculating a dimension.

```
22 \def\@settopoint#1{\divide#1\p@\multiply#1\p@}
23 </2ekernel>
```

(End definition for \@settopoint.)

File s

ltfssbas.dtx

This file contains the main implementation of the ‘low level’ font selection commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of the L^AT_EX ‘New’ Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

1 Preliminary macros

We define a number of macros that will be used later.

`\@nomath` `\@nomath` is used by most macros that will have no effect in math mode. It issues a warning message.

```

1  \<*2kernel>
2  \def\@nomath#1{\relax\ifmmode
3    \@font@warning{Command \noexpand#1invalid in math mode}\fi}

```

(End definition for \@nomath.)

`\no@alphabet@error` The macro `\no@alphabet@error` is called whenever the user requests a math *alphabet* that is not available in the current *version*. In math mode an error message is produced otherwise the command keeps silent. The argument is the name of the control sequence that identifies the math *alphabet*. The `\relax` at the beginning is necessary to prevent T_EX from scanning too far in certain situations.

```

4  \gdef\no@alphabet@error#1{\relax \ifmmode
5    \@latex@error{Math\space alphabet\space identifier\space
6      \noexpand#1is\space undefined\space in\space math\space
7      version\space ‘\math@version’}%
8    {Your\space requested\space math\space alphabet\space
9      is\space undefined\space in\space the\space current\space
10     math\space version.^JCheck\space the\space spelling\space
11     or\space use\space the\space \noexpand\SetMathAlphabet\space
12     command.}
13    \fi}

```

(End definition for \no@alphabet@error.)

`\new@mathgroup` We also give a new name to `\newfam` and `\fam` to avoid verbal confusion (see the introduction).¹⁰

`\mathgroup`

```

14  %\def\new@mathgroup{\alloc@8\mathgroup\chardef\sixt@@n}
15  \let\mathgroup\fam
16  %\let\newfam\new@mathgroup
17  \@onlypreamble\new@mathgroup

```

(End definition for \new@mathgroup and \mathgroup.)

¹⁰For the same reason it seems advisable to `\let\fam` and `\newfam` equal to `\relax`, but this is commented out to retain compatibility to existing style files.

2 Macros for setting up the tables

`\DeclareFontShape` The macro `\DeclareFontShape` takes 6 arguments:

```
18 \def\DeclareFontShape{\begingroup
```

First we restore the catcodes of all characters used in the syntax.

```
19 \nfss@catcodes
```

We use `\expandafter \endgroup` to restore catcode in case something goes wrong with the argument parsing (suggested by Tim Van Zandt)

```
20 \expandafter\endgroup
```

```
21 \DeclareFontShape@}
```

(End definition for `\DeclareFontShape`.)

`\DeclareFontShape@`

```
22 \</2kernel>
```

```
23 \<*2kernel | latexrelease>
```

```
24 \<latexrelease>\IncludeInRelease{2020/02/02}%
```

```
25 \<latexrelease> \<\DeclareFontShape@>\{Maybe drop one m\}%
```

```
26 \def\DeclareFontShape@#1#2#3#4#5#6{%
```

```
27 \expandafter\ifx\csname #1+#2\endcsname\relax
```

```
28 \<@latex@error{Font family ‘#1+#2’ unknown}\@eha
```

```
29 \else
```

If the series value is incorrectly specified with an extra “m”, e.g., “mc” instead of just “c”, drop the surplus “m” but keep the “m” if it is by its own. In that case also issue a warning that the declaration needs correction.

For this we compare the given value #3 with one where we may have dropped an “m”. If nothing has changes, fine. Otherwise there was a wrong value which is now corrected in `\reservedb` so we use that and also issue a warning.

```
30 \edef\reserved@a{#3}%
```

```
31 \series@maybe@drop@one@m\reserved@a\reserved@b
```

```
32 \ifx\reserved@a\reserved@b\else
```

```
33 \<@latex@warning{Font shape declaration has incorrect series
```

```
34 value ‘#3’.\MessageBreak It should not contain an ‘m’!
```

```
35 Please correct it.\MessageBreak Found\}%
```

```
36 \fi
```

```
37 \expandafter
```

```
38 \xdef\csname#1/#2/\reserved@b/#4\endcsname
```

```
39 {\expandafter\noexpand\csname #5\endcsname}%
```

```
40 %
```

Most of the time #6 is empty so using `\let` to `\@empty` saves on space compared to using `\def`. That’s really one of the old space saving techniques and probably not necessary these days.

```
41 \def\reserved@a{#6}%
```

```
42 \global
```

```
43 \expandafter\let\csname#5\endcsname\expandafter\endcsname
```

```
44 \ifx\reserved@a\@empty
```

```
45 \@empty
```

```
46 \else
```

```
47 \reserved@a
```

```
48 \fi
```

```
49 \fi
```

```
50 }
```

```

51 </2ekernel | latexrelease>
52 <latexrelease>\EndIncludeInRelease
53 <latexrelease>\IncludeInRelease{0000/00/00}%
54 <latexrelease>          {\DeclareFontShape@}{Maybe drop one m}%

```

(End definition for \DeclareFontShape@.)

\DeclareFixedFont Define a direct font switch that avoids all overhead.

```

75 \def\DeclareFixedFont#1#2#3#4#5#6{%
76   \begingroup
77   \math@fontsfalse
78   \every@math@size{}%
79   \fontsize{#6}\z@
80   \usefont{#2}{#3}{#4}{#5}%
81   \global\expandafter\let\expandafter#1\the\font
82   \endgroup
83 }

```

(End definition for \DeclareFixedFont.)

\do@subst@correction

```

84 \def\do@subst@correction{%
85   \xdef\subst@correction{%
86     \font@name
87     \global\expandafter\font
88     \csname \curr@fontshape/\f@size\endcsname
89     \noexpand\fontname\font
90     \relax}%

```

Calling \subst@correction after the current group means calling it after we have loaded the substitution font which is done inside a group.

```

91   \aftergroup\subst@correction
92 }

```

(End definition for \do@subst@correction.)

`\DeclareFontFamily`

```
93 \def\DeclareFontFamily#1#2#3{%
```

If we want fast checking for the encoding scheme we can just check for `\T@..` being defined.

```
94 % \@tempswafalse
95 % \def\reserved@b{#1}%
96 % \def\cdp@elt##1##2##3##4{\def\reserved@c{##1}%
97 %     \ifx\reserved@b\reserved@c \@tempswatrue\fi}%
98 % \cdp@list
99 % \if@tempswa
100 % \ifundefined{T@#1}%
101 % {
102 %   \@latex@error{Encoding scheme ‘#1’ unknown}\@eha
103 % }%
104 % }
```

Now we have to define the macro `\(<#1>+<#2>)` to contain `#3`. But since most of the time `#3` will be empty we use `\let` in a tricky way rather than a simple `\def` since this will save internal memory. We store the argument `#3` in a temporary macro `\reserved@a`.

```
105 \def\reserved@a{#3}%
```

We compare `\reserved@a` with `\@empty`. If these two are the same we `\let` the ‘extra’ macro equal to `\@empty` which is not the same as doing a `\let` to `\reserved@a` — the latter would blow one extra memory location rather than reusing the one from `\@empty`.

```
106 \global
107 \expandafter\let\csname #1+##2\expandafter\endcsname
108 \ifx \reserved@a\@empty
109 \@empty
110 \else \reserved@a
111 \fi
112 }%
113 }
```

(End definition for \DeclareFontFamily.)

`\cdp@list` We initialize the code page list to be empty.

```
114 \let\cdp@list\@empty
115 \@onlypreamble\cdp@list
```

(End definition for \cdp@list.)

`\cdp@elt`

```
116 \let\cdp@elt\relax
117 \@onlypreamble\cdp@elt
```

(End definition for \cdp@elt.)

`\DeclareFontEncoding`

```
118 \def\DeclareFontEncoding{%
```

First we start with ignoring all blanks and newlines since every surplus space in the second or third argument will come out in a weird place in the document.

```

119 \begingroup
120 \nfss@catcodes
121 \expandafter\endgroup
122 \DeclareFontEncoding@
123 \@onlypreamble\DeclareFontEncoding

124 \def\DeclareFontEncoding@#1#2#3{%
125 \expandafter
126 \ifx\csname T@#1\endcsname\relax
127 \def\cdp@elt{\noexpand\cdp@elt}%
128 \xdef\cdp@list{\cdp@list\cdp@elt{#1}%
129 {\default@family}{\default@series}%
130 {\default@shape}}%

```

To support encoding dependent commands (like accents) we initialise the command `\encoding-cmd` to be `\@changed@cmd`. (See `ltoutenc.dtx` for details.)

```

131 \expandafter\let\csname#1-cmd\endcsname\@changed@cmd
132 \else
133 \@font@info{Redefining font encoding #1}%
134 \fi

135 \global\@namedef{T@#1}{#2}%
136 \global\@namedef{M@#1}{\default@M#3}%

```

Keep a record of the last encoding being declared:

```

137 \xdef\LastDeclaredEncoding{#1}%
138 }
139 \@onlypreamble\DeclareFontEncoding@

```

(End definition for `\DeclareFontEncoding`.)

`\LastDeclaredEncoding` The last encoding being declared by `\DeclareFontEncoding`.

```

140 \def\LastDeclaredEncoding{}

```

(End definition for `\LastDeclaredEncoding`.)

`\DeclareFontSubstitution`

```

141 \def\DeclareFontSubstitution#1#2#3#4{%
142 \expandafter
143 \ifx\csname T@#1\endcsname\relax
144 \@latex@error{Encoding scheme ‘#1’ unknown}\@eha
145 \else
146 \begingroup

```

We loop through the `\cdp@list` and rebuild it anew in `\toks@` thereby replacing the defaults for the encoding in question with the new defaults. It is important to store the encoding to test against expanded in `\reserved@a` since it might just be `\LastDeclaredEncoding` that is passed as `#1`.

```

147 \edef\reserved@a{#1}%
148 \toks@{}%
149 \def\cdp@elt##1##2##3##4{%
150 \def\reserved@b{##1}%
151 \ifx\reserved@a\reserved@b

```

Here we use the new defaults but we use `##1` (i.e., the encoding name already stored previously) since we know that it is expanded.

```
152      \addto@hook\toks@{\cdp@elt{##1}{#2}{#3}{#4}}%
153      \else
```

If `\reserved@a` and `\reserved@b` differ then we simply copy from the old list to the new.

```
154      \addto@hook\toks@{\cdp@elt{##1}{##2}{##3}{##4}}%
155      \fi}%
156      \cdp@list

```

(End definition for `\default@T` and `\default@M`.)

`\DeclarePreloadSizes`

```
185 \def\DeclarePreloadSizes#1#2#3#4#5{%
186   \@ifundefined{T@#1}%
187   {\@latex@error{Encoding scheme ‘#1’ unknown}\@eha}%
188   {%
```

Don't know at the moment what this group here does!

```
189 \begingroup
```

We define a macro `\reserved@f`¹¹ that grabs the next *size* and loads the corresponding font. This is done by delimiting `\reserved@f`'s only argument by the token `,` (comma).

```
190 \def\reserved@f##1,{%
```

The end of the list will be detected when there are no more elements, i.e. when `\reserved@f`'s argument is empty. The trick used here is explained in Appendix D of the *T_EXbook*: if the argument is empty the `\if` will select the first clause and `\let \reserved@f \relax`. (We use the `>` character here since it cannot appear in font file names.)

```
191 \if>##1>%
192 \let\reserved@f\relax
193 \else
```

Otherwise, we define `\font@name` appropriately and call `\pickup@font` to do the work. Note that the requested `\curr@fontshape` combination must have been defined, or you will get an error. The definition of `\font@name` is carried out globally to be consistent with the rest of the code in this file.

```
194 \xdef\font@name{\csname#1/#2/#3/#4/##1\endcsname}%
195 \pickup@font
```

Now we forget the name of the font just loaded. More precisely, we set the corresponding control sequence to `\relax`. This means that later on, when the font is first used, the macro `\define@newfont` is called again to execute the 'extra' macro for this font.

```
196 \global\expandafter\let\font@name\relax
197 \fi
```

Finally we call `\reserved@f` again to process the next *size*. If `\reserved@f` was `\let` equal to `\relax` this will end the macro.

```
198 \reserved@f}%
```

We finish with reinserting the list of sizes after the `\reserved@f` macro and appending an empty element so that the end of the list is recognized properly.

```
199 \reserved@f#5,,%
200 \endgroup
201 }%
202 }
203 \@onlypreamble\DeclarePreloadSizes
```

(End definition for `\DeclarePreloadSizes`.)

`\ifmath@fonts` We need a switch to decide if we have to switch math fonts. For this purpose we provide `\ifmath@fonts` that can be set to true or false by the `\S@...` macros depending on if math fonts are provided for this size or not. The default is of course to switch all fonts.

```
204 \newif\ifmath@fonts \math@fontstrue
```

(End definition for `\ifmath@fonts`.)

¹¹We cannot use `\@tempa` since it is needed in `\pickup@font`.

`\DeclareMathSizes` `\DeclareMathSizes` takes the text size, math text size, math script size, and math scriptscript size as arguments and defines the right `\S@...` macro.

```

205 \def\DeclareMathSizes{%
206   \@ifstar{\@DeclareMathSizes\math@fontsfalse}%
207   {\@DeclareMathSizes{}}%
208   \@onlypreamble\DeclareMathSizes
(End definition for \DeclareMathSizes and \DeclareMathSizes*.)

```

`\@DeclareMathSizes` This modification by Michael J. Downes on comp.text.tex on 2002/10/17 allows the user to have settings such as

```

```
250 \@onlypreamble\@DeclareMathSizes
```

(End definition for \@DeclareMathSizes.)

3 Selecting a new font

3.1 Macros for the user

`\fontencoding` As we said in the introduction a font is described by four parameters. We first define macros to specify the wanted *family*, *series*, or *shape*. These are simply recorded in internal macros `\f@family`, `\f@series`, and `\f@shape`, resp. We use `\edef`'s so that the arguments can also be macros.

```
251 \DeclareRobustCommand\fontencoding[1]{%
252   \expandafter\ifx\csname T@#1\endcsname\relax
253   \latexerror{Encoding scheme ‘#1’ unknown}\@eha
254   \else
255   \edef\f@encoding{#1}%
256   \ifx\cf@encoding\f@encoding
```

If the new encoding is the same as the old encoding we have nothing to do. However, in case we had a sequence of several encoding changes without a `\selectfont` in-between we can save processing by making sure that `\enc@update` is `\relax`.

```
257   \let\enc@update\relax
258   \else
```

If current and new encoding differ we define the macro `\enc@update` to contain all updates necessary at `\selectfont` time.

```
259   \let\enc@update\@enc@update
260   \fi
261   \fi
262 }
```

(End definition for `\fontencoding` and `\f@encoding`.)

`\@enc@update`

```
263 \def\@enc@update{%
```

When `\@enc@update` is executed `\f@encoding` holds the encoding name for the new encoding and `\cf@encoding` the name of the last active encoding.

We start by setting the init command for encoding dependent macros to `\@changed@cmd`.

```
264   \expandafter
265   \let
266   \csname\cf@encoding-cmd\endcsname
267   \@changed@cmd
```

Then we turn the one for the new encoding to `\@current@cmd` (see `ltoutenc.dtx` for further explanations).

```
268   \expandafter
269   \let
270   \csname\f@encoding-cmd\endcsname
271   \@current@cmd
```

We execute the default settings `\default@T`, followed by the one for the new encoding.

```
272   \default@T
273   \csname T@\f@encoding\endcsname
```

Finally we change the default substitution values, disable `\enc@update` and make `\f@encoding` officially the current encoding.

```
274      \csname D@\f@encoding\endcsname
275      \let\enc@update\relax
276      \let\cf@encoding\f@encoding
277  }
```

(End definition for \@enc@update.)

`\enc@update` The default action in `\selectfont` is to do nothing.

```
278 \let\enc@update\relax
```

(End definition for \enc@update.)

`\fontfamily`

`\f@family`

`\fontseries`

`\f@series`

`\fontshape`

`\f@shape`

```
279 \DeclareRobustCommand\fontfamily[1]{\edef\f@family{#1}}
```

There are now defined later (and differently).

```
280 %\DeclareRobustCommand\fontseries[1]{\edef\f@series{#1}}
```

```
281 %\DeclareRobustCommand\fontshape [1]{\edef\f@shape{#1}}
```

(End definition for \fontfamily and others.)

`\usefont` Some handy abbreviation if you want to get some particular font in the current size. If also the size should change one has to issue a `\fontsize` command first.

`\fontencoding` needs to do some setup work so we call that, but instead of calling `\fontfamily`, `\fontseries` and `\fontshape` it earlier versions of this code did, we now set `\f@family`, etc. directly. If we would call `\fontseries` or `\fontshape` as it was done in the past, they would now interact with the existing series and shape which is not desired if we intend to use an explicit font shape!

```
282 </2ekernel>
283 <*2ekernel | latexrelease>
284 <latexrelease>\IncludeInRelease{2020/02/02}%
285 <latexrelease>          {\usefont}{Drop m in usefont}%
286 \DeclareRobustCommand\usefont[4]{\fontencoding{#1}%
287   \edef\f@family{#2}%
288   \set@target@series{#3}%
289   \edef\f@shape{#4}\selectfont
290   \ignorespaces}
291 </2ekernel | latexrelease>
292 <latexrelease>\EndIncludeInRelease
293 <latexrelease>\IncludeInRelease{0000/00/00}%
294 <latexrelease>          {\usefont}{Drop m in usefont}%
295 <latexrelease>
296 <latexrelease>\DeclareRobustCommand\usefont[4]{\fontencoding{#1}%
297   \edef\f@family{#2}%
298   \edef\f@series{#3}%
299   \edef\f@shape{#4}\selectfont
300   \ignorespaces}
301 <latexrelease>
302 <latexrelease>\EndIncludeInRelease
303 <*2ekernel>
```

(End definition for \usefont.)

`\linespread` The command `\linespread` changes the current `\baselinestretch` by calling `\set@fontsize`. The values for `\f@size` and `\f@baselineskip` will be left unchanged.

```
304 \DeclareRobustCommand\linespread[1]
305   {\set@fontsize{#1}\f@size\f@baselineskip}
```

(End definition for \linespread.)

`\fontsize` We also define a macro that allows to specify a size. In this case, however, we also need the value of `\baselineskip`. As the first argument to `\set@fontsize` we pass the current value of `\baselinestretch`. This will either match the internal value (in which case nothing changes, or it will be an updated value due to a user change of that macro using `\renewcommand`. If we would pass the internal `\f@linespread` such a change would be effectively overwritten by a size change.

```
306 \DeclareRobustCommand\fontsize[2]
307   {\set@fontsize\baselinestretch{#1}{#2}}
```

(End definition for \fontsize.)

`\f@linespread` This macro holds the current internal value for `\baselinestretch`.

```
308 \let\f@family\@empty
309 \let\f@series\@empty
310 \let\f@shape\@empty
311 \let\f@size\@empty
312 \let\f@baselineskip\@empty
313 \let\f@linespread\@empty
```

(End definition for \f@linespread.)

`\cf@encoding`

```
314 \let\f@encoding\@empty
315 \let\cf@encoding\@empty
```

(End definition for \cf@encoding.)

`\@defaultunits` The function `\@defaultunits` when wrapped around a dimen or skip assignment supplies default units. Usage:

```
\@defaultunits\dimen@=#1pt\relax\@nnil
```

Note: the `\relax` is **important**. Other units can be substituted for the ‘pt’ if desired.

We use `\remove@to@nnil` as an auxiliary macros for `\@defaultunits`. It just has to gobble the supplied default unit ‘pt’ or whatever, if it wasn’t used in the assignment.

```
316 \def\@defaultunits{\afterassignment\remove@to@nnil}
```

(End definition for \@defaultunits.)

`\strip@pt` This macro strips the characters pt produced by using `\the` on a dimen register.

```
\rem@pt 317 \begingroup
318   \catcode‘P=12
319   \catcode‘T=12
320   \lowercase{
321     \def\x{\def\rem@pt##1.##2PT{##1\ifnum##2>\z@.##2\fi}}
322   \expandafter\endgroup\x
323 \def\strip@pt{\expandafter\rem@pt\the}
```

(End definition for `\strip@pt` and `\rem@pt`.)

`\mathversion` `\mathversion` takes the math *version* name as argument, defines `\math@version` appropriately and switches to the font selected forcing a call to `\glb@settings` if the *version* is known to the system.

```

324 \DeclareRobustCommand\mathversion[1]
325     {\@nomath\mathversion
326       \expandafter\ifx\csname mv@#1\endcsname\relax
327       \latex@error{Math version ‘#1’ is not defined}\@eha\else
328       \edef\math@version{#1}%

```

We need to force a math font setup both now and at the point where we return to the previous math version. Forcing a math font setup can simply be done by setting `\glb@currsz` to an invalid value since this will trigger the setup when the formula starts.

```

329     \gdef\glb@currsz{}%

```

When the scope of the current `\mathversion` ends we need to restore the old setup. However this time we need to force it directly at least if we are inside math, otherwise we could wait. Another way to enhance this code here is to do the setting only if the version really has changed after all. This might be interesting in case of `amstext` and `boldsymbol`.

```

330     \aftergroup\glb@settings
331     \fi}

```

(End definition for `\mathversion` and `\math@version`.)

If $\mathrm{T}_{\mathrm{E}}\mathrm{X}$ would support a hook just before the end of a formula (opposite of `\everymath` so to speak) the implementation of the algorithm would be much simpler because in that case we would set up the correct math fonts at this point without having to worry about incorrect settings due to nesting. The same would be true if in $\mathrm{L}^{\mathrm{A}}\mathrm{T}_{\mathrm{E}}\mathrm{X}$ the use of `$` (as the primitive $\mathrm{T}_{\mathrm{E}}\mathrm{X}$ command) would be impossible and instead only a higher-level interface would be available. Note that this does not mean that a `$` couldn't be the short-hand for starting and stopping that higher-level interface, it only means that the direct $\mathrm{T}_{\mathrm{E}}\mathrm{X}$ function must be hidden.

Anyway, since we don't have this and won't have it in $\mathrm{L}^{\mathrm{A}}\mathrm{T}_{\mathrm{E}}\mathrm{X} 2_{\epsilon}$ we need to implement it in a somewhat slower way.

We test for the current math font setup on entry of a formula, i.e., on the hooks `\everymath` and `\everydisplay`. But since these hooks may contain user data we provide ourselves with an internal version of these hooks which stays frozen.

`\frozen@everymath` `\frozen@everydisplay` New internal names for `\everymath` and `\everydisplay`.

```

332 \let\frozen@everymath\everymath
333 \let\frozen@everydisplay\everydisplay

```

(End definition for `\frozen@everymath` and `\frozen@everydisplay`.)

`\everymath` `\everydisplay` Now we provide now user hooks that will be called in the frozen internals.

```

334 \newtoks\everymath
335 \newtoks\everydisplay

```

(End definition for `\everymath` and `\everydisplay`.)

`\frozen@everymath` Now we define the behaviour of the frozen hooks: first check the math setup then call the user hook.

```
336 \frozen@everymath = {\check@mathfonts
337                      \the\everymath}
```

(End definition for `\frozen@everymath`.)

`\frozen@everydisplay` Ditto for the display hook.

```
338 \frozen@everydisplay = {\check@mathfonts
339                        \the\everydisplay}
```

(End definition for `\frozen@everydisplay`.)

`\curr@math@size` This holds locally the current math size.

```
340 \let\curr@math@size\@empty
```

(End definition for `\curr@math@size`.)

3.2 Macros for loading fonts

`\pickup@font` The macro `\pickup@font` which is used in `\selectfont` is very simple: if the font name is undefined (i.e. not known yet) it calls `\define@newfont` to load it.

```
341 \def\pickup@font{%
342     \expandafter \ifx \font@name \relax
343     \define@newfont
344     \fi}
```

(End definition for `\pickup@font`.)

`\split@name` `\pickup@font` assumes that `\font@name` is set but it is sometimes called when `\f@family`, `\f@series`, `\f@shape`, or `\f@size` may have the wrong settings (see, e.g., the definition of `\getanddefine@fonts`). Therefore we need a macro to extract font *family*, *series*, *shape*, and *size* from the font name. To this end we define `\split@name` which takes the font name as a list of characters of `\catcode 12` (without the backslash at the beginning) delimited by the special control sequence `\@nil`. This is not very complicated: we first ensure that `/` has the right `\catcode`

```
345 {\catcode'\/=12
```

and define `\split@name` so that it will define our private `\f@encoding`, `\f@family`, `\f@series`, `\f@shape`, and `\f@size` macros.

```
346 \gdef\split@name#1/#2/#3/#4/#5\@nil{\def\f@encoding{#1}%
347                                     \def\f@family{#2}%
348                                     \def\f@series{#3}%
349                                     \def\f@shape{#4}%
350                                     \def\f@size{#5}}}
```

(End definition for `\split@name`.)

`\curr@fontshape` Abbreviation which may get removed again for speed.

```
351 \def\curr@fontshape{\f@encoding/\f@family/\f@series/\f@shape}
```

(End definition for `\curr@fontshape`.)

`\define@newfont` Now we can tackle the problem of defining a new font.

```
352 \def\define@newfont{%
```

We have already mentioned that the token list that `\split@name` will get as argument must not start with a backslash. To reach this goal we will set the `\escapechar` to `-1` so that the `\string` primitive will not generate an escape character. To keep this change local we open a group. We use `\begingroup` for this purpose since `\define@newfont` might be called in math mode, and an empty `\bgroup... \egroup` would add an empty Ord atom to the math list and thus affect the spacing.

Also locally redefine `\typeout` so that ‘No file ...fd’ Warnings become Font Info message just sent to the log file.

```
353 \begingroup
354 \let\typeout\@font@info
355 \escapechar\m@ne
```

Then we extract *encoding scheme*, *family*, *series*, *shape*, and *size* from the font name. Note the four `\expandafter`’s so that `\font@name` is expanded first, then `\string`, and finally `\split@name`.

```
356 \expandafter\expandafter\expandafter
357 \split@name\expandafter\string\font@name\@nil
```

If the `\curr@fontshape` combination is not available, (i.e. undefined) we call the macro `\wrong@fontshape` to take care of this case. Otherwise `\extract@font` will load the external font for us.

```
358 % \expandafter\ifx
359 % \csname\curr@fontshape\endcsname \relax
360 \try@load@fontshape % try always
361 % \fi
362 \expandafter\ifx
363 \csname\curr@fontshape\endcsname \relax
364 \wrong@fontshape\else
```

To allow substitution we call the `\curr@fontshape` macro which usually will expand to `\relax` but may hold code for substitution (see `\subst@fontshape` definition).

```
365 % \csname\curr@fontshape\endcsname
366 \extract@font\fi
```

We are nearly finished and must only restore the `\escapechar` by closing the group.

```
367 \endgroup}

368 \def\try@load@fontshape{%
369 \expandafter
370 \ifx\csname \f@encoding+\f@family\endcsname\relax
371 \@font@info{Trying to load font information for
372 \f@encoding+\f@family}%
```

We predefine this combination to be `\@empty` which means that next time we don’t try again unnecessary in case we don’t find a `.fd` file. If the file contains a `\DeclareFontFamily` command than this setting will be overwritten.

```
373 \global\expandafter\let
374 \csname \f@encoding+\f@family\endcsname\@empty
```

Set the catcodes used in the syntax, but do it only once (this will be restored at the end of the font loading group).

```
375 \nfss@catcodes
376 \let\nfss@catcodes\relax
```

For increased portability make the external filename monospace, but look for the (old style) mixed case filename if the first attempt fails.

On any monospace system this means that the file is looked for twice which takes up time and string space, but at least for this release Check for both names to give people time to re-install their private fd files with lowercase names.

```

377     \edef\reserved@a{%
378         \lowercase{%
379             \noexpand\InputIfFileExists{\f@encoding\f@family.fd}}}%
380     \reserved@a\relax
381     {\@input@{\f@encoding\f@family.fd}}%
382 \fi}

```

(End definition for `\define@newfont`.)

`\nfss@catcodes` This macro should contain the standard `\catcode` assignments to all characters which are used in the commands found in an `.fd` file and which might have special `\catcodes` in the middle of a document. If necessary, this list can be extended in a package file using a suitable number of `\expandafter`, i.e.,

```

\expandafter\def\expandafter\nfss@catcodes
\expandafter{\nfss@catcodes <additional settings>}

```

Note, that this macro might get executed several times since it is also called by `\DeclareFontShape`, thus it probably should not be misused as a general purpose hook.

```

383 \def\nfss@catcodes{%

```

We start by making `@` a letter and ignoring all blanks and newlines.

```

384     \makeatletter
385     \catcode'\ 9%
386     \catcode'\^~I9%
387     \catcode'\^~M9%

```

Then we set up `\`, `{`, `}`, `#` and `%` in case an `.fd` file is loaded during a verbatim environment.

```

388     \catcode'\z@
389     \catcode'\{ \@ne
390     \catcode'\}\tw@
391     \catcode'\#6%
392     \catcode'\^7%
393     \catcode'\%14%

```

The we make sure that the important syntax parts have the right `\catcode`.

```

394     \@makeother\<%
395     \@makeother\>%
396     \@makeother\*%
397     \@makeother\.%
398     \@makeother\-%
399     \@makeother\/%
400     \@makeother\[%
401     \@makeother\]%
402     \@makeother\'%
403     \@makeother\'%
404     \@makeother\"%
405 }

```

(End definition for \nfss@catcodes.)

```
\LoadFontDefinitionFile Load and .fd files for some encoding and family (if it exists).

```

(End definition for \LoadFontDefinitionFile.)

\DeclareFontFamilySubstitution The idea for this macro is stolen from the `substitutefont` package by Günter Milde, with some modifications and a new name.

Its purpose is to provide characters in a special encoding that are not available in the current font family to be taken from a different family that is visually compatible (or not if you choose badly). For example, you can match the GFS Didot Greek characters with T_EX Gyre Pagella (Palatino) by specifying

```
\DeclareFontFamilySubstitution{LGR}{qpl}{udidot}
```

This way if you ask for the LGR encoding in for the qpl family you get the characters from the udidot family substituted.

We need to ensure that the macro is defined with \nfss@catcodes in force (not quite sure why at the moment to be honest).

```
425 </2ekernel>
426 <*2ekernel | latexrelease>
427 <latexrelease>\IncludeInRelease{2020/02/02}%
428 <latexrelease>{\DeclareFontFamilySubstitution}{Provide family substitution}%
429 \begingroup
430 \nfss@catcodes
431 \gdef\DeclareFontFamilySubstitution#1#2#3{%
```

We only provide a set of silent substitutions. The package also (re)declared the family, but this is incorrect in my eyes and it is better to handle that differently.

Of course the families may still need loading at this point and so we arrange for this. Otherwise we might run into trouble because the necessary \DeclareFontFamily has not been seen.

```
432   \LoadFontDefinitionFile{#1}{#2}%
433   \LoadFontDefinitionFile{#1}{#3}%
```

```

434 \DeclareFontShape{#1}{#2}{m}{it}{<->ssub * #3/m/it}{}%
435 \DeclareFontShape{#1}{#2}{m}{n}{<->ssub * #3/m/n}{}%
436 \DeclareFontShape{#1}{#2}{m}{sc}{<->ssub * #3/m/sc}{}%
437 \DeclareFontShape{#1}{#2}{m}{sl}{<->ssub * #3/m/sl}{}%

```

These days a few more shapes might be around, so we declare those too. If they don't exist then after the first substitution normal fallbacks will happen.

```

438 \DeclareFontShape{#1}{#2}{m}{sw}{<->ssub * #3/m/sw}{}%
439 \DeclareFontShape{#1}{#2}{m}{scit}{<->ssub * #3/m/scit}{}%
440 \DeclareFontShape{#1}{#2}{m}{scsl}{<->ssub * #3/m/scsl}{}%

```

Same game with b and bx, for other weights you are on your own:

```

441 \DeclareFontShape{#1}{#2}{b}{it}{<->ssub * #3/b/it}{}%
442 \DeclareFontShape{#1}{#2}{b}{n}{<->ssub * #3/b/n}{}%
443 \DeclareFontShape{#1}{#2}{b}{scit}{<->ssub * #3/b/scit}{}%
444 \DeclareFontShape{#1}{#2}{b}{scsl}{<->ssub * #3/b/scsl}{}%
445 \DeclareFontShape{#1}{#2}{b}{sc}{<->ssub * #3/b/sc}{}%
446 \DeclareFontShape{#1}{#2}{b}{sl}{<->ssub * #3/b/sl}{}%
447 \DeclareFontShape{#1}{#2}{b}{sw}{<->ssub * #3/b/sw}{}%
448 \DeclareFontShape{#1}{#2}{bx}{it}{<->ssub * #3/bx/it}{}%
449 \DeclareFontShape{#1}{#2}{bx}{n}{<->ssub * #3/bx/n}{}%
450 \DeclareFontShape{#1}{#2}{bx}{scit}{<->ssub * #3/bx/scit}{}%
451 \DeclareFontShape{#1}{#2}{bx}{scsl}{<->ssub * #3/bx/scsl}{}%
452 \DeclareFontShape{#1}{#2}{bx}{sc}{<->ssub * #3/bx/sc}{}%
453 \DeclareFontShape{#1}{#2}{bx}{sl}{<->ssub * #3/bx/sl}{}%

498 <latexrelease>\EndIncludeInRelease
499 <*2ekernel>
500 \@onlypreamble\DeclareErrorFont

```

(End definition for `\DeclareErrorFont`.)

`\wrong@fontshape` Before we come to the macro `\extract@font` we have to take care of unknown `\curr@fontshape` combinations. The general strategy is to issue a warning and to try a default *shape*, then a default *series*, and finally a default *family*. If this last one also fails T_EX will go into an infinite loop. But if the defaults are set incorrectly one deserves nothing else!

```

501 </2ekernel>
502 <latexrelease>\IncludeInRelease{2015/01/01}{\wrong@fontshape}%
503 <latexrelease>      {Font substitution in preamble}%
504 <*2ekernel | latexrelease>
505 \def\wrong@fontshape{%
506     \csname D@f@encoding\endcsname % install defaults if in math

```

We remember the wanted `\curr@fontshape` combination which we will need in a moment.

```

507     \edef\reserved@a{\csname\curr@fontshape\endcsname}%
508     \ifx\last@fontshape\reserved@a
509         \errmessage{Corrupted NFSS tables}%
510         \error@fontshape
511     \else

```

Then we warn the user about the mess and set the shape to its default.

```

512     \let\f@shape\default@shape

```

If the combination is not known, try the default *series*.

```
513     \expandafter\ifx\csname\curr@fontshape\endcsname\relax
514     \let\f@series\default@series
```

If this is still undefined, try the default *family*. Otherwise give up. We never try to change the encoding scheme!

```
515     \expandafter
516     \ifx\csname\curr@fontshape\endcsname\relax
517     \let\f@family\default@family
```

If we change the font family and we are in the preamble then the corresponding .fd file may not been loaded yet. Therefore we try this now. Otherwise equating the requested font shape with the finally selected fontshape below will fail and can result in “NFSS tables corrupted”. After begin document that will not happen as all .fd files involved in substitution are loaded at `\begin{document}`.

```
518     \begingroup
519     \try@load@fontshape
520     \endgroup
521     \fi \fi
522 \fi
```

At this point a valid `\curr@fontshape` combination must have been found. We inform the user about this fact.

The `\expandafter\string` here stops TeX adding the space that it usually puts after command names in messages. The similar construction with `\@undefined` just produces ‘undefined’, but saves a few tokens.

`\@wrong@font@char` is locally redefined in `\UseTextSymbol` from its normal (empty) definition, to report the symbol generating the font switch.

```
523     \@font@warning{Font shape ‘\expandafter\string\reserved@a’
524     \expandafter\@gobble\string\@undefined\MessageBreak
525     using ‘\curr@fontshape’ instead\@wrong@font@char}%
526     \global\let\last@fontshape\reserved@a
```

We change `\@defaultsubs` to produce a warning at the end of the document. The macro `\@defaultsubs` is initially `\relax` but gets changed here if some default font substitution happens. It is then executed in `\enddocument`.

```
527     \gdef\@defaultsubs{%
528     \@font@warning{Some font shapes were not available, defaults
529     substituted.\@gobbletwo}}%
```

If we substitute a `\curr@fontshape` combination by the default one we don’t want the warning to be printed out whenever this (unknown) combination is used. Therefore we globally `\let` the macro corresponding to the wanted combination equal to its substitution. This requires the use of four `\expandafter`’s since `\csname... \endcsname` has to be expanded before `\reserved@a` (i.e. the requested combination), and this must happen before the `\let` is executed.

```
530     \global\expandafter\expandafter\expandafter\let
531     \expandafter\reserved@a
532     \csname\curr@fontshape\endcsname
```

Now we can redefine `\font@name` accordingly. This *must* be done globally since it might occur in the group opened by `\define@newfont`. If we would this definition were local the closing `\endgroup` there would restore the old meaning of `\font@name` and then switch to the wrong font at the end of `\selectfont` although the correct font was loaded.

```

533 \xdef\font@name{%
534 \csname\curr@fontshape/\f@size\endcsname}%

The last thing this macro does is to call \pickup@font again to load the font if it is not
defined yet. At this point this code will loop endlessly if the defaults are not well defined.

535 \pickup@font}

\@wrong@font@char Normally empty but redefined in \UseTextSymbol so that the Font shape undefined message can refer to the symbol causing the problem.

```
572 \let\@wrong@font@char\@empty
```

(End definition for \@wrong@font@char.)

\@@defaultsubs See above.

```
\@defaultsubs 573 \let\@defaultsubs\relax
```

(End definition for \@@defaultsubs and \@defaultsubs.)

`\strip@prefix` In `\extract@font` we will need a way to recover the replacement text of a macro. This is done by the primitive `\meaning` together with the macro `\strip@prefix` (for the details see appendix D of the T_EXbook, p. 382).

```
574 \def\strip@prefix#1>{\}
```

(End definition for `\strip@prefix`.)

4 Assigning math fonts to *versions*

`\install@mathalphabet` This is just another name for `\gdef` but we can redefine it if necessary later on.

```
575 \let\install@mathalphabet\gdef
```

(End definition for `\install@mathalphabet`.)

`\math@fonts`

```
576 \let\math@fonts\@empty
```

(End definition for `\math@fonts`.)

`\select@group` `\select@group` has four arguments: the new *math alphabet identifier* (a control sequence), the *math group number*, the extra macro for math mode and the `\curr@fontshape` definition macro name. We first check if we are in math mode.

```
577 %\def\select@group#1#2#3{\relax\ifmmode
```

We do these things locally using `\begingroup` instead of `\bgroup` to avoid the appearance of an empty Ord atom on the math list.

```
578 % \begingroup
```

We set the math fonts for the *family* in question by calling `\getanddefine@fonts` in the correct environment.

```
579 % \escapechar\m@ne
```

```
580 % \getanddefine@fonts{\csname c@mv@\math@version\endcsname}#3%
```

We globally select the math fonts...

```
581 % \globaldefs\@ne \math@fonts
```

... and close the group to restore `\globaldefs` and `\escapechar`.

```
582 % \endgroup
```

As long as no *size* or *version* change occurs the *math alphabet identifier* should simply switch to the installed *math group* instead of calling `\select@group` unnecessarily. So we globally redefine the first argument (the new *math alphabet identifier*) to expand into a `\mathgroup` switch and then select this *alphabet*. Note that this redefinition will be overwritten by the next call to a *version* macro. The original code for the end of `\select@group` was

```
\gdef#1{#3\mathgroup #2}#1\fi}
```

i.e. first redefining the *math alphabet identifier* and then calling the new definition to switch to the wanted *math group*. Now we define the *math alphabet identifier* as a call to the `\use@mathgroup` command.

```
583 % \xdef#1{\noexpand\use@mathgroup\noexpand#2%
```

```
584 % {\number\csname c@mv@\math@version\endcsname}}%
```

But this is not sufficient, as we learned the hard way. The problem here is that the loading of the fonts that comprise the alphabet identifier #1, as well as the necessary math font assignments is deferred until it is used. This is OK so far, but if the fonts are switched within the current formula (which may happen if a sub-formula is a box that contains a math version switch) the font assignments for #1 are not restored unless #1 is used again. This is disastrous since TeX sees the wrong fonts at the end of the math formula, when it converts the math list into a horizontal list.

This is taken into account as follows: When a math alphabet identifier is used for the first time in a certain version it modifies the corresponding macro `\mv@<version>` so that it calls `\getanddefine@fonts` directly in future as well. We use the macro `\extract@alph@from@version` to do this. It takes the math alphabet identifier #1 and the math version macro as arguments.

```

585 %      \expandafter\extract@alph@from@version
586 %      \csname mv@\math@version\expandafter\endcsname
587 %      \expandafter{\number\csname c@mv@\math@version\endcsname}%
588 %      #1%
589 %      \stepcounter{mv@\math@version}%

```

Finally, it is not possible to simply call the new definition since we have an argument (the third argument of `\use@mathgroup` or more exactly the argument of `\math@egroup` if the `margid` option is in force) which would swallow our closing `\fi`. So we use the `\expandafter` technique to remove the `\fi` before the `\use@mathgroup` is expanded.

```

590 %\expandafter #1\fi}

```

(End definition for `\select@group`.)

`\extract@alph@from@version` We proceed to the definition of the macro `\extract@alph@from@version`. As stated above, it takes a math alphabet identifier and a math version macro (e.g. `\mv@normal`) as its arguments.

```

591 \def\extract@alph@from@version#1#2#3{%

```

To extract and replace the definition of math alphabet identifier #3 in macro #1 we have to recall how this definition looks like: Somewhere in the replacement text of #1 there is the sequence

```

\install@mathalphabet<math alphabet identifier> #3{%
  <Definitions for >#3}

```

Hence, the first thing we do is to extract the tokens preceding this definitions, the definition itself, and the tokens following it. To this end we define one auxiliary macro `\reserved@a`.

```

592 \def\reserved@a##1\install@mathalphabet#3##2##3\@nil{%

```

When `\reserved@a` is expanded, it will have the tokens preceding the definition in question in its first argument (##1), the following tokens in its third argument (##3), and the replacement text for the math alphabet identifier #3 in its second argument. (##2). This is then recorded for later use in a temporary macro `\reserved@b`.

```

593 \def\reserved@b{##2}%

```

Additionally, we define a macro `\reserved@c` to reconstruct the definitions for the math version in question from the tokens that will remain unchanged (##1 and ##3) and the yet to build new definitions for the math alphabet identifier #3.

```

594 \def\reserved@c####1{\gdef#1{##1####1##3}}%

```

Then we execute our auxiliary macro.

```
595 \expandafter\reserved@a#1\@nil
```

OK, so now we have to build the new definition for #3. To do so, we first extract the interesting parts out of the old one. The old definition looks like:

```
\select@group<math alphabet identifier>
  <math group number><math extra part>
<curr@fontshape definition>
```

So we define a new temporary macro `\reserved@a` that extracts these parts.

```
596 \def\reserved@a\select@group#3##1##2\@nil{%
```

This macro can now directly rebuild the math version definition by calling `\reserved@c`:

```
597 \reserved@c{%
598 \getanddefine@fonts{#2}##2%
599 \install@mathalphabet#3{%
600 \relax\ifmmode \else \non@alpherr#3\fi
601 \use@mathgroup##1{#2}}}%
```

In addition it defines the alphabet the way it should be used from now on.

```
602 \gdef#3{\relax\ifmmode \else \non@alpherr#3\fi
603 \use@mathgroup##1{#2}}}%
```

Finally, we only have to call this macro `\reserved@a` on the old definitions recorded in `\reserved@b`:

```
604 \expandafter\reserved@a\reserved@b\@nil
605 }
```

(End definition for `\extract@alph@from@version`.)

`\math@bgroup` Here are the default definitions for `\math@bgroup` and `\math@egroup`. We use `\bgroup` instead of `\begingroup` to avoid ‘leaking out’ of style changes. This has the side effect of always producing mathord atoms.

```
606 \let\math@bgroup\bgroup
607 \def\math@egroup#1{#1\egroup}
```

(End definition for `\math@bgroup` and `\math@egroup`.)

`\calculate@math@sizes` Here is the default definition for `\calculate@math@sizes` a more elaborate interface is under testing in `mthscale.sty`.

```
608 \gdef\calculate@math@sizes{%
609 \@font@info{Calculating\space math\space sizes\space for\space
610 size\space <\f@size>}%
611 \dimen@ \f@size \p@
612 \@tempdimb \defaultscriptratio \dimen@
613 \dimen@ \defaultscriptscriptratio \dimen@
614 \expandafter\xdef\csname S@\f@size\endcsname{%
615 \gdef\noexpand\tf@size{\f@size}%
616 \gdef\noexpand\sf@size{\strip@pt\@tempdimb}%
617 \gdef\noexpand\ssf@size{\strip@pt\dimen@}%
618 \noexpand\math@fontstrue}}
```

(End definition for `\calculate@math@sizes`.)

```

\defaultscriptratio The default ratio for math sizes is:
\defaultscriptscriptratio 1 to \defaultscriptratio to \defaultscriptscriptratio.
By default this is 1 to .7 to .5.
619 \def\defaultscriptratio{.7}
620 \def\defaultscriptscriptratio{.5}

(End definition for \defaultscriptratio and \defaultscriptscriptratio.)

\noaccents@ If we don't have a definition for \noaccents@ we provide a dummy.
621 \ifx\noaccents@\undefined
622   \let\noaccents@\empty
623 \fi

(End definition for \noaccents@.)

\showhyphens The \showhyphens command must be redefined since the version in plain.tex uses
\tenrm. We have also made some further adjustments for its use in LATEX.

XeTeX version. When using system fonts XeTeX reports consecutive runs of characters as a single item in box logging, which means the standard \showhyphens does not work. This version typesets the text into a narrow box to force hyphenation and then reconstructs a horizontal list with explicit hyphens to generate the display. Note that the lmr OpenType font is forced, this works even if the characters are not in the font as hyphenation is attempted due to the width of the space and hyphen character. It may generate spurious Missing Character warnings in the log, these are however suppressed from the terminal output by ensuring that \tracingonline is locally zero.

File t

ltfssaxes.dtx

This file contains the implementation for handling extra axes splitting the series and the values into sub-categories. selection commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of the L^AT_EX Font Selection Scheme.

Everything in the this file got introduced 2020/02/02, so we use large rollback chunks, only interrupted if necessary.

```
1 <*2ekernel | latexrelease>
2 <latexrelease> \IncludeInRelease{2020/02/02}%
3 <latexrelease>   {\DeclareFontSeriesChangeRule}{Series change rules}%
```

1 Changing the font series

In the original NFSS implementation the series was a single attribute stored in `\f@series` and so one always had to specify both weight and width together. This means it was impossible to typeset, a paragraph in a condensed font and inside have a few words in bold weight (but still condensed) without doing this manually by requesting `\fontseries{bc}\selectfont`.

The new implementation now works differently by looking both at the current value of `\f@series` and the requested new series and out of that combination selects a resulting series value. Thus, if the current series is `c` and we ask for `b` we now get `bc`.

This is done by consulting a simple lookup table. This table is configurable (though most likely that flexibility will seldom of ever be needed) Adding or changing entries in this table are done with `\DeclareFontSeriesChangeRule`.

1.1 The series lookup table

`\DeclareFontSeriesChangeRule` The `\DeclareFontSeriesChangeRule` defines entries in a simple database (implemented as a set of commands) that define mappings between from an existing series and requested new series and maps that to a result series (and additionally offers an alternative if the desired one is not existing):

```
#1 current \f@series
#2 requested new series
#3 result (if that exist for the given font family
#4 alternative result (if #3 does not exist)
```

If an `.fd` file has its own substitution rules then `#3` exist and thus `#4` is not applied.

If there is no matching database entry or if neither the result nor the alternate result exist in the font family the requested new series is used (which then may trigger substitutions later on.

```
4 \def\DeclareFontSeriesChangeRule#1#2#3#4{%
5   \@namedef{series@#1@#2}{#{#3}#{#4}}}
```

(End definition for `\DeclareFontSeriesChangeRule`.)

1.2 Mapping rules for series changes

The rules set up use explicit series values not `\..default` indirections; my current feeling is that this is in fact better.

With 9 weights and 9 width classes this table is getting a bit large in the end (324 entries) but on the other hand it doesn't change and accessing speed and it is fast this way.

We could alternatively split the axis and maintain weight and width separately, but that would take more processing time and would not allow for setting up explicit exceptions nicely (not sure that this would ever get used though).

Design considerations for mapping entries:

- We make `m` to reset both weight and width (as this is how it always worked). To reset just the width `?m` is provided and to reset just the weight `m?`.
- We do support “*mwidth*” and “*weightm*”, e.g., `mec` to mean “go to medium weight and extra-condensed width”. At the end of the process we automatically drop any leftover `m` in the series name (unless it is just a single `m`).
- If there is no table entry then the target series is used unconditionally. This means that any request to set both weight and width (e.g. `bx` or `ulc`) needs no table entries. For that reason there are no entries which have a weight+width as request (i.e., second argument).

In particular this is also true for cases involving `m`, e.g., `bm` (bold medium width) which automatically gets reduced result in `b` or `mc` (medium weight condensed) which becomes `c` as a result.

- Only a few entries have “alternative” values and perhaps most of them should get dropped. Or maybe not ... needs some thought perhaps.

The idea is that you don't want the normal substitution to kick in because that would reset the shape first and it may be better to stay with `b` when a change to `c` is requested and `bc` doesn't exist, than to go to first change the shape to `n` and then find that `bc/n` doesn't exist either and thus ending up with `m/n`.

- Also: while I did set up all nine standard weight values from `ul` to `ub` I only bothered to provide entries for `ec`, `sc`, `c` and `x`, because other levels of compression/expansion are not in any real fonts that I know.

Could and perhaps should be eventually extended to cover the whole set.

Special rules for `lm` etc. aren't needed because if the target `lm` is request it will used if there is no rule and that id then reduced to `l` automatically. Same for `mc` and friends. Only `?m` and `m?` need rules.

So here are the special rules for `m?`:

```

284 \DeclareFontSeriesChangeRule {bc}{m?}{c}{}
285 \DeclareFontSeriesChangeRule {bec}{m?}{ec}{}
286 \DeclareFontSeriesChangeRule {bsc}{m?}{sc}{}
287 \DeclareFontSeriesChangeRule {bx}{m?}{x}{}
288 \DeclareFontSeriesChangeRule {b}{m?}{m}{}
289 \DeclareFontSeriesChangeRule {c}{m?}{c}{}
290 \DeclareFontSeriesChangeRule {ebc}{m?}{c}{}
291 \DeclareFontSeriesChangeRule {ebec}{m?}{ec}{}
292 \DeclareFontSeriesChangeRule {ebsc}{m?}{sc}{}
293 \DeclareFontSeriesChangeRule {ebx}{m?}{x}{}
294 \DeclareFontSeriesChangeRule {eb}{m?}{m}{}
295 \DeclareFontSeriesChangeRule {ec}{m?}{ec}{}
296 \DeclareFontSeriesChangeRule {elc}{m?}{c}{}
297 \DeclareFontSeriesChangeRule {elec}{m?}{ec}{}
298 \DeclareFontSeriesChangeRule {elsc}{m?}{sc}{}
299 \DeclareFontSeriesChangeRule {elx}{m?}{x}{}
300 \DeclareFontSeriesChangeRule {el}{m?}{m}{}
301 \DeclareFontSeriesChangeRule {lc}{m?}{c}{}
302 \DeclareFontSeriesChangeRule {lec}{m?}{ec}{}
303 \DeclareFontSeriesChangeRule {lsc}{m?}{sc}{}
304 \DeclareFontSeriesChangeRule {lx}{m?}{x}{}
305 \DeclareFontSeriesChangeRule {l}{m?}{m}{}
306 \DeclareFontSeriesChangeRule {m}{m?}{m}{}
307 \DeclareFontSeriesChangeRule {sbc}{m?}{c}{}
308 \DeclareFontSeriesChangeRule {sbec}{m?}{ec}{}
309 \DeclareFontSeriesChangeRule {bsc}{m?}{sc}{}
310 \DeclareFontSeriesChangeRule {sbx}{m?}{x}{}
311 \DeclareFontSeriesChangeRule {sb}{m?}{m}{}
312 \DeclareFontSeriesChangeRule {sc}{m?}{sc}{}
313 \DeclareFontSeriesChangeRule {slc}{m?}{c}{}
314 \DeclareFontSeriesChangeRule {slec}{m?}{ec}{}
315 \DeclareFontSeriesChangeRule {slsc}{m?}{sc}{}
316 \DeclareFontSeriesChangeRule {slx}{m?}{x}{}
317 \DeclareFontSeriesChangeRule {sl}{m?}{m}{}
318 \DeclareFontSeriesChangeRule {ubc}{m?}{c}{}
319 \DeclareFontSeriesChangeRule {ubec}{m?}{ec}{}
320 \DeclareFontSeriesChangeRule {ubsc}{m?}{sc}{}
321 \DeclareFontSeriesChangeRule {ubx}{m?}{x}{}
322 \DeclareFontSeriesChangeRule {ub}{m?}{ub}{}
323 \DeclareFontSeriesChangeRule {ulc}{m?}{c}{}
324 \DeclareFontSeriesChangeRule {ulec}{m?}{ec}{}
325 \DeclareFontSeriesChangeRule {ulsc}{m?}{sc}{}
326 \DeclareFontSeriesChangeRule {ulx}{m?}{x}{}

```

```

327 \DeclareFontSeriesChangeRule {ul}{m?}{m}{-}
328 \DeclareFontSeriesChangeRule {x}{m?}{x}{-}
    And there the special rules for ?m:
329 \DeclareFontSeriesChangeRule {bc}{?m}{b}{-}
330 \DeclareFontSeriesChangeRule {bec}{?m}{b}{-}
331 \DeclareFontSeriesChangeRule {bsc}{?m}{b}{-}

1.3 Changing to a new series

```

391 <*2ekernel | latexrelease>
392 <latexrelease>\IncludeInRelease{2021/05/01}%
393 <latexrelease> {\fontseries}{delay fontseries update}%

```

\fontseries The **\fontseries** command takes one argument which is the requested new font series. In the original implementation it simply saved the expanded value in **\f@series**. Now we do a bit more processing and look up the final value in the font series data base. This is done by **\merge@font@series**. But the lookup should be done within the target family and call to **\fontseries** might be followed by a **\fontfamily** call. So we delay the processing to **\selectfont** and only record the necessary action in **\delayed@f@adjustment**.

```

394 \DeclareRobustCommand\fontseries[1]{\@forced@seriesfalse
395   \expandafter\def\expandafter\delayed@f@adjustment\expandafter
396     {\delayed@f@adjustment\delayed@merge@font@series{#1}}}

```

(End definition for \fontseries.)

\delayed@f@adjustment The macro holding the delayed action(s) for use in **\selectfont**.

```

397 \let\delayed@f@adjustment\@empty

```

(End definition for \delayed@f@adjustment.)

\fontseriesforce To change unconditionally to a new series you can use **\fontseriesforce**. Of course, if the series doesn't exist for the current family substitution still happens, but there is not dependency on the current series.

```

398 \DeclareRobustCommand\fontseriesforce[1]{\@forced@seriestrue
399   \expandafter\def\expandafter\delayed@f@adjustment\expandafter
400     {\delayed@f@adjustment\edef\f@series{#1}}}

```

(End definition for \fontseriesforce.)

\if@forced@series If the series gets forced we need to know that fact later on.

```

401 \newif\if@forced@series

```

(End definition for \if@forced@series.)

```

402 </2ekernel | latexrelease>
403 <latexrelease>\EndIncludeInRelease

```

```

404 <latexrelease>\IncludeInRelease{2020/02/02}%

406 <latexrelease>
407 <latexrelease>\DeclareRobustCommand\fontseries[1]{\@forced@seriesfalse
408 <latexrelease>          \merge@font@series{#1}}
409 <latexrelease>\DeclareRobustCommand\fontseriesforce[1]{\@forced@seriestrue
410 <latexrelease>          \edef\f@series{#1}}
411 <latexrelease>\let\delayed@f@adjustment\@undefined
412 <latexrelease>

```

For a roll forward we may have to define `\if@forced@series` but this needs doing in a somewhat roundabout way.

```

413 <latexrelease>\ifx\@forced@seriestrue\@undefined \else
414 <latexrelease> \expandafter\newif\csname if@forced@series\endcsname
415 <latexrelease>\fi
416 <latexrelease>
417 <latexrelease>\EndIncludeInRelease
418 <latexrelease>\IncludeInRelease{0000/00/00}%
419 <latexrelease>          {\fontseries}{delay fontseries update}%
420 <latexrelease>
421 <latexrelease>\DeclareRobustCommand\fontseries[1]{\edef\f@series{#1}}
422 <latexrelease>\let\fontseriesforce\@undefined
423 <latexrelease>
424 <latexrelease>\EndIncludeInRelease
425 <*2ekernel | latexrelease>
426 <latexrelease>\IncludeInRelease{2020/02/02}%
427 <latexrelease>  {\merge@font@series}{Merge series values}%

```

`\merge@font@series` We look up the data base value by expanding the right command twice. If no such value exist then the result will be `\relax` otherwise it will be the two brace groups: the desired result and the alternate result. The first case means that the third argument to `\merge@font@series` will be empty.

```

428 \def\merge@font@series#1{%
429   \expandafter\expandafter\expandafter
430   \merge@font@series@
431   \csname series@\f@series @#1\endcsname
432   {#1}%
433   \@nil
434 }

```

(End definition for \merge@font@series.)

`\merge@font@series@` This now defines the new `\f@series`:

```

435 \def\merge@font@series@#1#2#3\@nil{%

```

If the third argument is empty there is no database entry for the combination and the second argument holds the new series so we return that.

Originally the test was simply `\ifx!#3!` but that actually dies if `#3` starts with a conditional and in the definition of `\AmSfont` that is actually the case.

```

436 %\ifcat\expandafter X\detokenize{#1}X%
437 \def\reserved@a{#3}%
438 \ifx\reserved@a\@empty
439   \set@target@series{#2}%
440 \else

```

Otherwise we check if the desired result for the series (#1) exists for the font family and the current shape. All this happens inside `\selectfont` which has already taken care to load the `.fd` file if necessary.

```
441 \edef\reserved@a{\f@encoding /\f@family /#1/\f@shape}%
442 \ifcsname \reserved@a \endcsname
```

If the desired result is available then we use that. However, we do need some post-processing because we need to drop surplus ms due to the way naming convention was designed in the '90s (sigh).

```
443 \set@target@series{#1}%
```

If not, then we try the alternate result (#2).

```
444 \else
445 \ifcsname \f@encoding /\f@family /#2/\f@shape \endcsname
```

If the alternate result exist we use that and also issue a warning (or rather a log entry) that we didn't managed to change to the desired font.

```
446 \set@target@series{#2}%
447 \@font@shape@subst@warning
```

If that doesn't exist either, then we use the requested series unmodified (again with a warning).

```
448 \else
449 \set@target@series{#3}%
450 \@font@shape@subst@warning
451 \fi
452 \fi
453 \fi
454 }
```

It is possible that the previous font and the new one are actually identical (and the font was not found because it still needs loading) in which case a warning would look rather odd. So we make a quick check for that (which is the reason why we defined `\@reserveda` above instead of doing inline testing inside `\ifcsname`).

```
455 \def\@font@shape@subst@warning{%
456 \edef\reserved@b{\curr@fontshape}%
457 \ifx\reserved@a\reserved@b \else
458 \@font@warning{Font shape '\reserved@a' undefined\MessageBreak
459 using '\reserved@b' instead}%
460 \fi
461 }
```

(End definition for `\merge@font@series@`.)

`\merge@font@series@without@substitution`
`\merge@font@series@without@substitution@`
`\delayed@merge@font@series`

`\merge@font@series@without@substitution` works like `\merge@font@series`, i.e., it looks up the combination in the rule base and if there exists an entry it uses it and if not it uses the new series value. However, it doesn't check if there is actually a font face with the new series value as `\merge@font@series` does. This simplified command is used in `\selectfont` at a point where other font attributes are not yet updated so that checking the font face might result incorrect in substitutions.

```
462 \def\merge@font@series@without@substitution#1{%
463 \expandafter\expandafter\expandafter
464 \merge@font@series@without@substitution@
465 \csname series@\f@series @#1\endcsname
```

```

466     {#1}%
467     \@nil
468 }
469 \def\merge@font@series@without@substitution@#1#2#3\@nil{%
470   \def\reserved@a{#3}%
471   \ifx\reserved@a\@empty
472     \set@target@series{#2}%
473   \else
474     \set@target@series{#1}%
475   \fi
476 }

```

(End definition for \merge@font@series@without@substitution,
\merge@font@series@without@substitution@, and \delayed@merge@font@series.)

\delayed@merge@font@series When we delay the merge action in `\fontseries` we first attempt to use merging without substitution. If that results in a non-existing font face the merge is redone in `\selectfont` using a version with substitution. See `\selectfont` for details.

```

477 \let\delayed@merge@font@series\merge@font@series@without@substitution

```

(End definition for \delayed@merge@font@series.)

\maybe@load@fontshape A small helper that we use a couple of times: try loading a fontshape (in a group because `\try@load@fontshape` normalizes catcodes and we also want to change `\typeout` so that it doesn't report missing .fd files on the terminal).

```

478 \def\maybe@load@fontshape{%
479   \begingroup
480   \let \typeout \@font@info
481   \try@load@fontshape
482   \endgroup}

```

(End definition for \maybe@load@fontshape.)

\set@target@series Finally the code for normalizing the `\f@series` value.
The combined series value determined by the mapping may still contain an `m` that we have to remove (as the .fd files use `c` not `mc` to denote a medium weight condensed series, etc.). We do this in all branches above because a user might have written

```
\DeclareFontSeriesChangeRule {m}{sc}{msc}{mc}
```

instead of using `sc` and `c` as needed in the .fd file.

```

483 \def\set@target@series#1{%

```

We need to `\edef` the argument first in case it starts with a conditional. Then we check (and perhaps drop) an “m” from the value and assign the result to `\f@series`.

```

484   \edef\f@series{#1}%
485   \series@maybe@drop@one@m\f@series\f@series
486 }

```

(End definition for \set@target@series.)

`\series@maybe@drop@one@m` If the series value is in NFSS notation then it should not contain any “m” unless it is just an “m” by its own. So we need to drop surplus “m”s. But we better don’t do this for full names, such as “**semibold**” as used by `autoinst`, for example. So we test against the possible explicit values that should drop an “m”. After that we assign the result to `#2` for further use.

```

487 \def\series@maybe@drop@one@m#1{%
488   \expandafter\series@maybe@drop@one@m@x\expandafter{#1}}
489
490 \def\series@maybe@drop@one@m@x#1#2{%

```

The code below is an inline version of the `\in@` macro without the group, so that it works in `\accent`.

```

491 \def\in@@#1,#1,{}%
492 \series@check@toks\expandafter{\in@@
493   ,ulm,elm,lm,slm,mm,slm,bm,ebm,ubm,muc,mec,mc,msc,msx,mx,mex,mux,{},{},#1,}%

495 \ifx\in@@\empty

```

The default definition for `\bfdefault` etc is actually `b\empty` so that we can detect if the user has changed the default. However that means a) the above test will definitely fail (maybe something to change) and b) we better use `\edef` on the next line to get rid of it as otherwise the test against `#2` (e.g. `\bfdef@ult`) will fail in other places.

```

496   \edef#2{#1}%
497 \else
498   \edef#2{\expandafter\series@drop@one@m #1m\series@drop@one@m}%
499 \fi
500 }

```

As a precaution we use a private `toks` register not `\toks@` as that is no longer hidden inside the group.

```

501 \newtoks\series@check@toks

```

(End definition for `\series@maybe@drop@one@m`.)

`\series@drop@one@m` Drop up to two `ms` but keep one if that makes the series value empty. Actually, with the current implementation we know that there is at least one in the series value itself and we added one after it, so all we have to do is now returning `#1#2` and dropping the rest.

```

502 \def\series@drop@one@m#1#2#3\series@drop@one@m{%
503 % \ifx\relax#1#2\relax m\else#1#2\fi
504   #1#2%
505 }

```

(End definition for `\series@drop@one@m`.)

2 Changing the shape

Shapes are also split in two axes (though it could be more if that is desirable), essentially building in an “sc” axis).

```

523 <*2kernel | latexrelease>
524 <latexrelease>\IncludeInRelease{2020/02/02}%
525 <latexrelease> {\DeclareFontShapeChangeRule}{Font shape change rules}%

```

`\DeclareFontShapeChangeRule` The database for shapes is done in exactly the same way, only that it is much smaller and we usually have no alternative shape (or rather it is empty thus not used).

```

526 \def\DeclareFontShapeChangeRule #1#2#3#4{%
527   \namedef{shape@#1@#2}{#{#3}{#4}}

```

(End definition for `\DeclareFontShapeChangeRule`.)

There is kind of the same problem with returning back from `sc` to normal. It sort of needs its own letter. In `fontspec` this was solved by the first time `\upshape` changes `it` or `sl` back (so only `sc` remains) and second time it changes then `sc` back to normal. Maybe that’s not a bad way to handle it, but decided for a slightly different approach: `n` always returns to “normal”, ie resets everything and `up` changes italic or slanted to upright and `ulc` undoes small caps.

So we now offer `\normalshape` (using `\shapedefault` which is normally the same as calling both `\ulcshape` and `\upshape`, only more efficient).

`\ulcshape` To request going back to upper/lowercase we need a new command. It uses `ulc` as shape name but this shape is virtual, i.e., it doesn’t exist as a real shape, it is only used as part of the database table entries and thus only appears in the second argument there (but not in the first).

```

528 \DeclareRobustCommand\ulcshape
529   {\not@math@alphabet\ulcshape\relax
530    \fontshape\ulcdefault\selectfont}
531 \let\ulcdefault\@undefined % for rollback
532 \newcommand\ulcdefault{ulc}

```

(End definition for `\ulcshape`, `\textulc`, and `\ulcdefault`.)

`\swshape` New command to select a swash shape. The standard rules put this in the same category as italics or slanted, i.e., if you ask for it then italics are undone. One could provide more complicated rules so that `it + sw` becomes `swit` but given that there are only very few fonts that have swash letters that level of flexibility (these days) would be just resulting in a lot of combinations that do not exist.

```

533 \DeclareRobustCommand\swshape
534   {\not@math@alphabet\swshape\relax
535    \fontshape\swdefault\selectfont}
536 \let\swdefault\@undefined % for rollback
537 \newcommand\swdefault{sw}

```

(End definition for `\swshape`, `\textsw`, and `\swdefault`.)

`\sscshape` New command to select spaced small capitals. This is only here because `fontaxes` offered it. There isn't a single free font that supports it. However, some commercial ones do, so we offer it so that at some point `fontaxes` could be retired.

So far there aren't any rules for it—probably there should be some putting it in the same category as `sc`.

```
538 \DeclareRobustCommand\sscshape
539     {\not@math@alphabet\sscshape\relax
540     \fontshape\sscdefault\selectfont}
541 \let\sscdefault\undefined      % for rollback
542 \newcommand\sscdefault{ssc}
```

(End definition for `\sscshape`, `\textssc`, and `\sscdefault`.)

2.1 Mapping rules for shape combinations

Many of the entries are commented out as we will get that result without any entry.

```
543 %\DeclareFontShapeChangeRule {n}{n}    {n}    {}
544 \DeclareFontShapeChangeRule {n}{it}    {it}    {sl}
545 \DeclareFontShapeChangeRule {n}{sl}    {sl}    {it}
546 %\DeclareFontShapeChangeRule {n}{sw}    {sw}    {}
547 %\DeclareFontShapeChangeRule {n}{sc}    {sc}    {}
548 \DeclareFontShapeChangeRule {n}{ulc}    {n}    {}
549 \DeclareFontShapeChangeRule {n}{up}    {n}    {}

550 %\DeclareFontShapeChangeRule {it}{n}    {n}    {}
551 %\DeclareFontShapeChangeRule {it}{it}    {it}    {}
552 \DeclareFontShapeChangeRule {it}{sl}    {sl}    {it}
553 %\DeclareFontShapeChangeRule {it}{sw}    {sw}    {}
```

If neither `scit` nor `scsl` exist then `sc` will be used as a fallback albeit with a log entry, so except for the latter there will be no change for CM or Latin Modern fonts.

```
554 \DeclareFontShapeChangeRule {it}{sc}    {scit}    {scsl}
555 \DeclareFontShapeChangeRule {it}{ulc}    {it}    {}
556 \DeclareFontShapeChangeRule {it}{up}    {n}    {}

557 %\DeclareFontShapeChangeRule {sl}{n}    {n}    {}
558 \DeclareFontShapeChangeRule {sl}{it}    {it}    {sl}
559 %\DeclareFontShapeChangeRule {sl}{sl}    {sl}    {}
560 %\DeclareFontShapeChangeRule {sl}{sw}    {sw}    {}
561 \DeclareFontShapeChangeRule {sl}{sc}    {scsl}    {scit}
562 \DeclareFontShapeChangeRule {sl}{ulc}    {sl}    {}
563 \DeclareFontShapeChangeRule {sl}{up}    {n}    {}

564 %\DeclareFontShapeChangeRule {sc}{n}    {n}    {}
565 \DeclareFontShapeChangeRule {sc}{it}    {scit}    {scsl}
566 \DeclareFontShapeChangeRule {sc}{sl}    {scsl}    {scit}
567 \DeclareFontShapeChangeRule {sc}{sw}    {scsw}    {sw}
568 %\DeclareFontShapeChangeRule {sc}{sc}    {sc}    {}
569 \DeclareFontShapeChangeRule {sc}{ulc}    {n}    {}
```

The next rule might be a bit surprising and rightly so. Correct would be that `sc` is not affected by `up`, i.e., remains `sc` as showed in the commented out rule. However, for nearly three decades commands such as `sc` or `\textup` changed small caps back to the “normal” shape. So for backward compatibility we keep that behavior.

As a result you are currently typesetting in `scit` or `scsl` using `\upshape` twice will return you to the normal shape too, the first will change to `sc` and the second (because of the rule below) change that to `n`. This is the way `fontspec` implemented its version on this interface, so this rule means we are also compatible with the way `fontspec` behaved. Still it remains an oddity which I would rather liked to have avoided.

```

570 %\DeclareFontShapeChangeRule {sc}{up} {sc} {}
571 \DeclareFontShapeChangeRule {sc}{up} {n} {}

572 %\DeclareFontShapeChangeRule {scit}{n} {n} {}
573 \DeclareFontShapeChangeRule {scit}{it} {scit} {}
574 \DeclareFontShapeChangeRule {scit}{sl} {scsl} {scit}
575 \DeclareFontShapeChangeRule {scit}{sw} {scsw} {sc} % or scit?
576 \DeclareFontShapeChangeRule {scit}{sc} {scit} {}
577 \DeclareFontShapeChangeRule {scit}{ulc} {it} {}
578 \DeclareFontShapeChangeRule {scit}{up} {sc} {}

```

The previous rule assumes that if `scit` exists then it exists as well. If not, the mechanism will save `ulc` in `\f@series` which most certainly doesn't exist. So when a font is later selected that would result in a substitution (so no harm done really). Alternatively, we could in this case use `n` as alternative, which may be a bit faster, but such a setup would be so weird in the first place that this isn't worth the effort.

```

579 %\DeclareFontShapeChangeRule {scsl}{n} {n} {}
580 \DeclareFontShapeChangeRule {scsl}{it} {scit} {scsl}
581 \DeclareFontShapeChangeRule {scsl}{sl} {scsl} {}
582 \DeclareFontShapeChangeRule {scsl}{sw} {scsw} {sc} % or scsl?
583 \DeclareFontShapeChangeRule {scsl}{sc} {scsl} {}
584 \DeclareFontShapeChangeRule {scsl}{ulc} {sl} {}
585 \DeclareFontShapeChangeRule {scsl}{up} {sc} {}

586 %\DeclareFontShapeChangeRule {scsw}{n} {n} {}
587 \DeclareFontShapeChangeRule {scsw}{it} {scit} {scsw}
588 \DeclareFontShapeChangeRule {scsw}{sl} {scsl} {}
589 \DeclareFontShapeChangeRule {scsw}{sw} {scsw} {}
590 \DeclareFontShapeChangeRule {scsw}{sc} {scsw} {}
591 \DeclareFontShapeChangeRule {scsw}{ulc} {sw} {}
592 \DeclareFontShapeChangeRule {scsw}{up} {sc} {}

593 %\DeclareFontShapeChangeRule {sw}{n} {n} {}
594 %\DeclareFontShapeChangeRule {sw}{it} {it} {}
595 %\DeclareFontShapeChangeRule {sw}{sl} {sl} {}
596 %\DeclareFontShapeChangeRule {sw}{sw} {sw} {}
597 \DeclareFontShapeChangeRule {sw}{sc} {scsw} {}
598 \DeclareFontShapeChangeRule {sw}{ulc} {sw} {}
599 \DeclareFontShapeChangeRule {sw}{up} {n} {}

`\normalshape` `\normalshape` resets both sub-axes if the default rules are used.

```
684 \protected\def\normalshape
685   {\not@math@alphabet\normalshape\relax
686    \fontshape\shapedefault\selectfont}%
```

(End definition for \normalshape.)

3 Make sure we win ...

This code implements one aspect of what the package `fontaxes` provide. So its redefinitions for the various shape commands, such as `\itshape` should no longer happen. We therefore force the standard definitions at `\AtBeginDocument` (later when this is defined. Once `fontaxes` is no longer doing such redefinitions that could be taken out again.

We use a separate macro so that we can easily disable this (in case of rollback).

`\reinstall@nfss@defs` I use `\protected` here not `\DeclareRobustCommand` to avoid extra status lines.

```
687 \def\reinstall@nfss@defs{%
688   \protected\def\upshape
689     {\not@math@alphabet\upshape\relax

745 </2kernel>

```

File u

ltfsstrc.dtx

1 Introduction

This package contains the code for tracing font loading and font changes. It basically overlays some of the low-level functions of NFSS with additional code used for tracing.

The package accepts the following options:

errorshow Write all information about font changes etc. only to the transcript file unless an error happens. This means that information about font substitution will not be shown on the terminal.

warningshow Show all NFSS warnings on the terminal. This setting corresponds to the default behaviour of NFSS if the `tracefnt` package is *not* loaded!

infoshow Show all NFSS warning and all NFSS info messages (that are normally only written to the transcript file) also on the terminal. This is the default if the `tracefnt` package is loaded.

debugshow In addition to **infoshow** show also changing of math fonts as far as possible (this option can produce a large amount of output).

loading Show the name of external fonts when they are loaded. This option shows only “newly” loaded fonts not those already preloaded in the format or the class file before the `tracefnt` package became active.

pausing Turn all font warnings into errors so that L^AT_EX will stop.

2 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

When this file is processed directly by L^AT_EX this will produce the documentation as well.

```
1 <*driver>
2 \documentclass{ltxdoc}
3
4
5 %\OnlyDescription % comment out for implementation details
6
7 \begin{document}
8   \DocInput{ltfsstrc.dtx}
9 \end{document}
10 </driver>
```

3 The Implementation

Warning: Read the macro documentation with a grain of salt. It is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

If we are making a package file it is a good idea to test whether we are running under 2e. This code is actually placed at the very beginning of this file for easier maintenance, thus commented out here.

```
11 <*package>
12 %\NeedsTeXFormat{LaTeX2e}
13 %\ProvidesPackage{tracefmt}[??/??/?? v?.??]
14 %
15 </package>
16 % Standard LaTeX package (font tracing)
```

The `debug` module makes use of commands contained in a special package file named `trace.sty`.¹²

```
16 <+debug> \input trace.sty
```

4 Handling Options

`\tracingfonts` Here is the definition of the integer register for the font trace. As a default in a package file we use 1 to give error messages if fonts are substituted. If this code is used for debugging or tracing reasons in the format file (i.e. in `fam.dtx`) we use 0 as the default. But if no font trace is used we build a definition that will produce a warning message.

```
17 <*2ekernel>
18 \def\tracingfonts{%
19   \@font@warning{Command \noexpand\tracingfonts
20     not provided.\MessageBreak
21     Use the ‘tracefmt’ package.\MessageBreak Command found:}%
22   \count@}
23 </2ekernel>
```

The `\count@` in the line above will remove the number after `\tracingfonts`. Note that this definition will be overwritten by the next line if one of these modules are included.

```
24 <*package, trace, debug>
25 \newcount\tracingfonts
26 \tracingfonts=0
27 </package, trace, debug>
```

(End definition for \tracingfonts.)

The option `errorshow` turns off all warnings so that only real errors are shown. `warningshow` corresponds to the NFSS default (when `tracefmt` is not loaded). `infoshow` is the default for this package here; and `debugshow`, `loading`, and `pausing` extend the amount of information even further.

```
28 <*package>
29 \DeclareOption{errorshow}{%
30   \def\@font@info#1{%

66         {I'll stop for every LaTeX Font Warning because
67          you requested\MessageBreak the 'pausing' option
68          to the tracefont package.}}%
69     }

```

We make `infoshow` the default, which in turn defines `\font@warning` and `\font@info`.

```

70 \ExecuteOptions{infoshow}
71 \ProcessOptions
72 \</package>

```

We also need a default definition inside the kernel:

```

73 \<*2kernel>
74 \def\@font@info#1{%
75     \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}%
76     {LaTeX Font Info: \space\space\space#1}}%
77 \def\@font@warning#1{%
78     \GenericWarning{(Font)\@spaces\@spaces\@spaces\space\space}%
79     {LaTeX Font Warning: #1}}%
80 \</2kernel>

```

5 Macros common to fam.tex and tracefmt.sty

In the first versions of `tracefmt.dtx` some macros of `fam.dtx`¹³ were redefined to include the extra tracing information. Now these macros are all defined in this file (i.e. removed from `fam.dtx`) and different production versions can be obtained simply by specifying a different set of modules to include when generating `lftss.dtx`.

5.1 General font loading

`\extract@font` This macro organizes the font loading. It first calls `\get@external@font` which will return in `\external@font` the name of the external font file (the `.tfm`) as it was determined by the NFSS tables.

```

81 <*2ekernel|package>
82 \def\extract@font{%
83   \get@external@font

```

Then the external font is loaded and assigned to the font identifier stored inside `\font@name` (for this reason we need `\expandafter`).

```

84   \global\expandafter\font\font@name\external@font\relax

```

When tracing we typeout the internal and external font name.

```

85 <*trace>
86   \ifnum \tracingfonts >\@ne
87     \@font@info{External font '\external@font'
88               loaded as\MessageBreak \font@name}\fi
89 </trace>

```

Finally we call the corresponding “loading action” macros to finish things. First the font is locally selected to allow the use of `\font` inside the loading action macros.

```

90   \font@name \relax

```

The next two lines execute the “loading actions” for the family and then for the individual font shape.

```

91   \csname \f@encoding+\f@family\endcsname
92   \csname\curr@fontshape\endcsname
93   \relax
94   }
95 </2ekernel|package>

```

The `\relax` at the end needs to be explained. This is inserted to prevent `TEX` from scanning too far when it is executing the replacement text of the loading code macros.

(End definition for \extract@font.)

`\get@external@font` This function tries to find an external font name. It will place the name into the macro `\external@font`. If no font is found it will return the one that was defined via `\DeclareErrorFont`.

```

96 <*2ekernel>
97 \def\get@external@font{%

```

We don’t know the external font name at the beginning.

```

98   \let\external@font\@empty
99   \edef\font@info{\expandafter\expandafter\expandafter\string
100     \csname \curr@fontshape \endcsname}%
101   \try@size@range

```

¹³This file is currently not distributed in documented form. Its code is part of `lftss.dtx`.

If this failed, we'll try to substitute another size of the same font. This is done by the `\try@size@substitution` macro. It “knows about” `\do@extract@font`, `\font@name`, `\f@size`, and so on.

```

102   \ifx\external@font\@empty
103     \try@size@substitution
104     \ifx\external@font\@empty
105       \@latex@error{Font \expandafter \string\font@name\space
106         not found}\@eha
107       \error@fontshape
108       \get@external@font
109   \fi\fi
110 }
111 \end{kernel}

```

(End definition for `\get@external@font`.)

```

112 \*2kernel | latexrelease | package)
113 \<latexrelease>\IncludeInRelease{2021/05/01}%
114 \<latexrelease> \selectfont\{Add hook to \selectfont}%

```

`\selectfont` The macro `\selectfont` is called whenever a font change must take place.

```

115 \DeclareRobustCommand\selectfont
116 {%

```

When `debug` is specified we actually want something like ‘undebug’. The font selection is now stable so that using `\tracingall` on some other macros will show us a lot of unwanted information about font loading. Therefore we disable tracing during font loading as long as `\tracingfonts` is less than 4.

```

117 \<+debug> \pushtracing
118 \<+debug> \ifnum\tracingfonts<4 \tracingoff
119 \<+debug> \else \tracingon\p\selectfont \fi

```

If `\baselinestretch` was redefined by the user it will not longer match its internal counterpart `\f@linespread`. If so we call `\set@fontsize` to prepare `\size@update`.

```

120 \ifx\f@linespread\baselinestretch \else
121 \set@fontsize\baselinestretch\f@size\f@baselineskip \fi

```

The series and shape updates are only prepared by `\fontseries` and `\fontshape` but not executed until after we are ready to change the font face. This way they happen after a possibly new family is set which is important because they look at the available font faces in that family and alter the selection based on availability. Several calls to `\fontseries` or `\fontshape` are delayed in the order in which they appear, so that by switching them one can work around missing intermediate font faces and avoid substitutions.

We first attempt to do the merge without any substitution. As we might end up with a non-existing font face we may have to restart and therefore save the current values of `\f@series` and `\f@shape` before the merge.

But first we make a quick test to see if there are any delayed actions, because if not it is pointless to make all the assignments and try loading a missing fontshape.

```

122 \ifx\delayed@f@adjustment\@empty
123 \else
124 \let\f@shape@saved\f@shape
125 \let\f@series@saved\f@series

```

The we run the delayed adjustments (which is using the `\..@without@substitution` commands

```
126      \delayed@f@adjustment
```

We then check if the resulting combination is valid but for this we have to make sure the the appropriate `.fd` is loaded if that hasn't happened so far.

```
127      \maybe@load@fontshape
```

```
128      \ifcsname \f@encoding/\f@family/\f@series/\f@shape \endcsname
```

If this macro is defined then we are good and no further action is necessary.

Otherwise the combination is not valid, so we redo the merge but this time with substitutions.

```
129      \else
```

```
130      \let\f@shape\f@shape@saved
```

```
131      \let\f@series\f@series@saved
```

```
132      \let\delayed@merge@font@shape\merge@font@shape
```

```
133      \let\delayed@merge@font@series\merge@font@series
```

```
134      \delayed@f@adjustment
```

```
135      \let\delayed@merge@font@shape\merge@font@shape@without@substitution
```

```
136      \let\delayed@merge@font@series\merge@font@series@without@substitution
```

```
137      \fi
```

Now the series and shape values are updated and we clear `\delayed@f@adjustment`. This is important because on the next execution of `\selectfont` we should not mistakenly redo the delayed actions if there wasn't any series or shape change.

```
138      \let\delayed@f@adjustment\@empty
```

```
139      \fi
```

Then we generate the internal name of the font by concatenating *family*, *series*, *shape*, and current *size*, with slashes as delimiters between them. This is much more readable than standard L^AT_EX's `\twfbf`, etc. We define `\font@name` globally, as always. The reason for this is explained later on.

```
140      \xdef\font@name{%
```

```
141      \csname\curr@fontshape/\f@size\endcsname}%
```

We call the macro `\pickup@font` which will load the font if necessary.

```
142      \pickup@font
```

Then we select the font.

```
143      \font@name
```

After switching fonts we run a hook, so that packages can make last minute alterations based on the new font (originally provided in `everyselect` but using a different interface).

```
144      \UseHook{selectfont}%
```

Finally we call `\size@update`. This macro is normally empty but will contain actions (like setting the `\baselineskip`) that have to be carried out when the font size, the base `\baselineskip` or the `\baselinestretch` have changed.

```
145      \size@update
```

A similar function is called to handle anything related to encoding updates. This one is changed from `\relax` by `\fontencoding`.

```
146      \enc@update
```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```
147 <+debug> \poptracing
148 }
```

(End definition for `\selectfont`.)

selectfont Declare the hook used in `selectfont` in the kernel, but not inside the `tracefnt` package.

```
149 <-trace>\NewHook{selectfont}
```

(End definition for `selectfont`.)

If `\tracingfonts` is greater than 2 we also show the font switch inside `\selectfont`. We do this by adding this code to the hook in the `tracefnt` package: macro might redefine `\font@name`.

```
150 <*trace>
151 \AddToHook{selectfont}
152   {\ifnum \tracingfonts>\tw@
153     \@font@info{Switching to \font@name}\fi}
154 </trace>
155 </2ekernel | latexrelease | package>
156 <latexrelease>\EndIncludeInRelease
```

With `\selectfont` having different definitions in different kernels we also have to provide them in the `tracefnt` package to support rollback. In packages that works a bit differently and therefore we have to provide an empty block there.

```
157 <package>\IncludeInRelease{2021/05/01}%
158 <package>           {\selectfont}{Add hook to \selectfont}%
159 <package>\EndIncludeInRelease

160 <latexrelease | package>\IncludeInRelease{0000/00/00}%
161 <latexrelease | package>           {\selectfont}{Add hook to \selectfont}%
162 <latexrelease | package>
163 <latexrelease | package>\DeclareRobustCommand\selectfont
164 <latexrelease | package>  {%
165 <latexrelease | package>    \ifx\f@linespread\baselinestretch \else
166 <latexrelease | package>    \set@fontsize\baselinestretch\f@size\f@baselineskip \fi
167 <latexrelease | package>    \xdef\font@name{%
168 <latexrelease | package>      \csname\curr@fontshape/\f@size\endcsname}%
169 <latexrelease | package>    \pickup@font
170 <latexrelease | package>    \font@name
171 <latexrelease | package>    \size@update
172 <latexrelease | package>    \enc@update
173 <latexrelease | package>  }
174 <latexrelease | package>
175 <latexrelease | package>\EndIncludeInRelease
```

\set@fontsize The macro `\set@fontsize` does the actual work. First it assigns new values to `\f@size`, `\f@baselineskip` and `\f@linespread`.

```
176 <*2ekernel | package>
177 \def\set@fontsize#1#2#3{%
178   \@defaultunits\@tempdimb#2pt\relax\@nnil
179   \edef\f@size{\strip@pt\@tempdimb}%
180   \@defaultunits\@tempskipa#3pt\relax\@nnil
181   \edef\f@baselineskip{\the\@tempskipa}%
182   \edef\f@linespread{#1}%
```

For backward compatibility and for later testing within `\selectfont` the internal value of `\f@linespread` is passed back to `\baselinestretch`.

```
183 \let\baselinestretch\f@linespread
```

Additional processing will happen within `\selectfont`. For this reason the macro `\size@update` (which will be called in `\selectfont`) will be defined to be:

```
184 \def\size@update{%
```

First calculate the new `\baselineskip` and also store it in `normalbaselineskip`

```
185 \baselineskip\f@baselineskip\relax
186 \baselineskip\f@linespread\baselineskip
187 \normalbaselineskip\baselineskip
```

then to set up a new `\strutbox`

```
188 \setbox\strutbox\hbox{%
189 \vrule\@height.7\baselineskip
190 \@depth.3\baselineskip
191 \@width\z@}%
```

We end with a bit of tracing information.

```
192 <*trace>
193 \ifnum \tracingfonts>\tw@
194 \ifx\f@linespread\@empty
195 \let\reserved@a\@empty
196 \else
197 \def\reserved@a{\f@linespread x}%
198 \fi
199 \font@info{Changing size to \f@size/\reserved@a
200 \f@baselineskip}%
201 \aftergroup\type@restoreinfo \fi
202 </trace>
```

When all this is processed `\size@update` redefines itself to `\relax` so that in later calls of `\selectfont` no extra code will be executed.

```
203 \let\size@update\relax%
204 }
```

Instead of defining this macro internally we might speed things up by placing the code into a separate macro and use `\let`!

(End definition for \set@fontsize.)

`\size@update` Normally this macro does nothing; it will be redefined by `\set@fontsize` to initiate an update.

```
205 \let\size@update\relax
```

(End definition for \size@update.)

`\type@restoreinfo` This macro produces some info when a font size and/or baseline change will get restored.

```
206 <*trace>
207 \def\type@restoreinfo{%
208 \ifx\f@linespread\@empty
209 \let\reserved@a\@empty
210 \else
211 \def\reserved@a{\f@linespread x}%
```

```

212      \fi
213      \@font@info{Restoring size to
214                  \f@size/\reserved@a\f@baselineskip}}
215  \end{trace}

(End definition for \type@restoreinfo.)

```

\glb@settings The macro **\glb@settings** globally selects all math fonts for the current size if necessary.

\glb@currsize 216 **\def\glb@settings{%**

When **\glb@settings** gains control a size change was requested and all previous font assignments need to be replaced. Therefore the old values of the fonts are no longer needed. For every *math group* the new assignments are appended to **\math@fonts**. But this happens only if the **math@fonts** switch is set to true. However, we always set up the correct math sizes for script and scriptscript fonts since they may be needed even if we don't set up the whole math machinery.

Here we set the math size, script size and scriptscript size. If the **S@...** macro is not defined we have to first calculate the three sizes.

```

217      \expandafter\ifx\csname S@\f@size\endcsname\relax
218      \calculate@math@sizes
219      \fi

```

The effect of this is that **\calculate@math@sizes** may or may not define the **S@...** macro. In the first case the next time the same size is requested this macro is used, otherwise **\calculate@math@sizes** is called again. This also sets the **math@fonts** switch. If it is true we must switch the math fonts.

```

220      \csname S@\f@size\endcsname
221      \ifmath@fonts
222      (*trace)
223      \ifnum \tracingfonts>\tw@
224      \@font@info{Setting up math fonts for
225                  \f@size/\f@baselineskip}\fi
226  \end{trace}

```

Inside a group we execute the macro for the current math *version*. This sets **\math@fonts** to a list of **\textfont...** assignments. **\getanddefine@fonts** (which may be called at this point) needs the **\escapechar** parameter to be set to -1 .

```

227      \begingroup
228      \escapechar\m@ne
229      \csname mv@\math@version\endcsname

```

Then we set **\globaldefs** to 1 so that all following changes are done globally. The math font assignments recorded in **\math@fonts** are executed and **\glb@currsize** is set equal to **\f@size**. This signals that the fonts for math in this size are set up.

```

230      \globaldefs\@ne
231      \math@fonts
232      \let \glb@currsize \f@size
233  \endgroup

```

Finally we execute any code that is supposed to happen whenever the math font setup changes. This register will be executed in local mode which means that everything that is supposed to have any effect should be done globally inside. We can't execute it within **\globaldefs\@ne** as we don't know what ends up inside this register, e.g., it might contain calculations which use some local registers to calculate the final (global) value.

```

234      \the\every@math@size

```

```

235 \*trace)
236 \else
237 \ifnum \tracingfonts>\tw@
238 \@font@info{No math setup for
239 \f@size/\f@baselineskip}\fi
240 \</trace)
241 \fi
242 }
243 \</2ekernel | package>

```

`\baselinestretch` In `\selectfont` we used `\baselinestretch` as a factor when assigning a value to `\baselineskip`. We use 1 as a default (i.e. no stretch).

```
244 <*2kernel>
245 \def\baselinestretch{1}
```

We must still define the hook `\every@math@size` we used in `\glb@settings`. We initialize it to nothing. It is important to remember that everything that goes into this hook should to global updates, local changes will have weird effects.

```

246 \newtoks\every@math@size
247 \every@math@size={}
248 \</2ekernel>

```

5.2 Math fonts setup

5.2.1 Outline of algorithm for math font sizes

\TeX uses the math fonts that are current when the end of a formula is reached. If we don't want to keep font setups local to every formula (which would result in an enormous overhead, we have to be careful not to end up with the wrong setup in case formulas are nested, e.g., we need to be able to handle

$$\$ a=b+c \quad \boxed{\text{small for all } \$b\$ \text{ and } \$c\in \mathbb{Z}\$}\$$$

Here the inner formulae b and $c \in \mathbb{Z}$ are typeset in `\small` but we have to return to `\normalsize` before we reach the closing `$` of the outer formula.

This is handled in the following way:

1. At any point in the document the global variable `\gbl@currsz` contains the point size for which the math fonts currently are set up.
2. Whenever we start a formula we compare its value with the local variable `\f@size` that describes the current text font size.
3. If both are the same we assume that we can use the current math font setup without adjustment.
4. If they differ we call `\gbl@settings` which changes the math font setup and updates `\gbl@currsz`.

- (a) If we are recursively inside another formula (`\if@inmath`) we ensure that `\glb@settings` is executed again in the outer formula, so that the old setup is automatically restored.
- (b) Otherwise, we set the switch `@inmath` locally to `true` so that all nested formulae will be able to detect that they are nested in some outer formula.

The above algorithm has the following features:

- For sizes which are not containing any formula no math setup is done. Compared to the original algorithm of NFSS this results in the following savings:
 - No unnecessary loading of math fonts for sizes that are not used to typeset any math formulae (explicit or implicit ones).
 - No time overhead due to unnecessary changes of the math font setup on entrance and exit of the text font size.
- Math font setup changes for top-level formulae will survive (there is no restoration after the formula) thus any following formula in the same size will be directly typesettable. Compared to original implementation in NFSS2 the new algorithm has the overhead of one test per formula to see if the current math setup is valid (in the original algorithm the setup was always valid, thus no test was necessary).
- In nested formulae the math font setup is restored in the outer formula by a series of `\aftergroup` commands and checks. Compared to the original algorithm this involves additional checks ($2 \times \langle \text{non-math levels} \rangle$ per inner formula).

5.2.2 Code for math font size setting

`\check@mathfonts` In the `\check@mathfonts` macros we implement the steps 2 to 4 except that instead of a switch the macro `\init@restore@glb@settings` is used.

```

249 \*2kernel|package)
250 \def\check@mathfonts{%
251   \ifx \glb@currsize \f@size
252   \*trace)
253     \ifnum \tracingfonts>\thr@@
254       \@font@info{*** MATH: no change \f@size\space
255         curr/global (\curr@math@size/\glb@currsize)}\fi
256   \*trace)
257   \else
258   \*trace)
259     \ifnum \tracingfonts>\thr@@
260       \@font@info{*** MATH: setting up \f@size\space
261         curr/global (\curr@math@size/\glb@currsize)}\fi
262   \*trace)
263     \glb@settings
264     \init@restore@glb@settings
265   \fi
266   \let\curr@math@size\f@size
267   \def\init@restore@glb@settings{\aftergroup\restglb@settings}%
268 }

```

(End definition for `\check@mathfonts`.)

`\init@restore@glb@settings` This macros does by default nothing but get redefined inside `\check@mathfonts` to initiate fontsize restoring in nested formulas.

```

269 <-trace>\let\init@restore@glb@settings\relax
270 <*trace>
271 \def\init@restore@glb@settings{%
272     \ifnum \tracingfonts>\thr@@
273         \@font@info{*** MATH: no resetting (not in
274                     nested math)}\fi
275 }
276 </trace>

```

(End definition for `\init@restore@glb@settings`.)

`\restglb@settings` This macro will be executed the first time after the current formula.

```

277 \def\restglb@settings{%
278 <*trace>
279     \ifnum \tracingfonts>\thr@@
280         \@font@info{*** MATH: restoring}\fi
281 </trace>
282     \begingroup
283         \let\f@size\curr@math@size
284         \ifx\glb@currsz \f@size
285 <*trace>

287             \@font@info{*** MATH: ... already okay (\f@size)}\fi
288 </trace>
289         \else
290 <*trace>
291             \ifnum \tracingfonts>\thr@@
292                 \@font@info{*** MATH: ... to \f@size}\fi
293 </trace>
294             \glb@settings
295         \fi
296     \endgroup
297 }

```

(End definition for `\restglb@settings`.)

5.2.3 Other code for math

`\use@mathgroup` The `\use@mathgroup` macro should be used in user macros to select a math group. Depending on whether or not the `margid` option is in force it has two or three arguments. For this reason it should be called as the last macro.

First we test if we are inside math mode since we don't want to apply a useless definition.

```

298 \def\use@mathgroup#1#2{\relax\ifmmode
299 <*trace>
300     \ifnum \tracingfonts>\tw@
301         \count@#2\relax
302         \@font@info{Using \noexpand\mathgroup
303                     (\the\count@) #2}\fi
304 </trace>

```

If so we first call the ‘=’ macro (i.e. argument three) to set up special things for the selected math group. Then we call `\mathgroup` to select the group given by argument two and finally we place `#1` (i.e. the argument of the *math alphabet identifier*) at the end. This part of the code is surrounded by two commands which behave like `\begingroup` and `\endgroup` if we want *math alphabet identifier*s but will expand into `\@empty` if we want simply switches to a new math group. Since argument number 2 may be a digit instead of a control sequence we add a `\relax`. Otherwise something like `\mit{1}` would switch to math group 11 (and back) instead of printing an oldstyle 1.

```

305     \math@bgroup
306     \expandafter\ifx\csname M@\f@encoding\endcsname#1\else
307     #1\fi
308     \mathgroup#2\relax

```

Before we reinsert the swallowed token (arg. three) into the input stream, in the case that the *math alphabet identifier* isn’t called in math mode, we remove the `\fi` with the `\expandafter` trick. This is necessary if the token is actually an macro with arguments. In such a case the `\fi` will be misinterpreted as the first argument which would be disastrous.

```

309     \expandafter\math@egroup\fi}%

```

The surrounding macros equal `\begingroup` and `\endgroup`. But using internal names makes it possible to overwrite their meaning in certain cases. This is for example used in \mathscr -TeX macros for placing accents.

(End definition for `\use@mathgroup`.)

`\math@egroup` If the `margid` option is in force (which can be tested by looking at the definition of `\math@bgroup` we change the `\math@egroup` command a bit to display the current *math group number* after it closes the scope of *math alphabet* with `\endgroup`.

```

310 (*trace)
311 \ifx\math@bgroup\bgroup
312 \def\math@egroup#1{#1\egroup
313 \ifnum \tracingfonts>\tw@
314 \@font@info{Restoring \noexpand\mathgroup
315 (\ifnum\mathgroup=\m@ne default\else \the\mathgroup \fi)%
316 }\fi}
317 \fi
318 (/trace)

```

(End definition for `\math@egroup`.)

`\getanddefine@fonts` `\getanddefine@fonts` has two arguments: the *math group number* and the *family/series/shape* name as a control sequence.

```

319 \def\getanddefine@fonts#1#2{%

```

First we turn of tracing when `\tracingfonts` is less than 4.

```

320 (+debug) \pushtracing
321 (+debug) \ifnum\tracingfonts<4 \tracingoff
322 (+debug) \else \tracingon\getanddefine@fonts \fi
323 (*trace)
324 \ifnum \tracingfonts>\tw@
325 \count@#1\relax
326 \@font@info{\noexpand\mathgroup (\the\count@) #1 :=\MessageBreak
327 \string#2 \tf@size/\sf@size/\ssf@size}\fi
328 (/trace)

```

We append the current `\tf@size` to #2 to obtain the font name.¹⁴ Again, `font@name` is defined globally, for the reasons explained in the description of `\wrong@fontshape`.

```
329 \xdef\font@name{\csname \string#2/\tf@size\endcsname}%
```

Then we call `\pickup@font` to load it if necessary. We remember the internal name as `\textfont@name`.

```
330 \pickup@font \let\textfont@name\font@name
```

Same game for `\scriptfont` and `\scriptscriptfont`:

```
331 \xdef\font@name{\csname \string#2/\sf@size\endcsname}%
332 \pickup@font \let\scriptfont@name\font@name
333 \xdef\font@name{\csname \string#2/\ssf@size\endcsname}%
334 \pickup@font
```

Then we append the new `\textfont...` assignments to the `\math@fonts`.

```
335 \edef\math@fonts{\math@fonts
336 \textfont#1\textfont@name
337 \scriptfont#1\scriptfont@name
338 \scriptscriptfont#1\font@name}%
```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```
339 <+debug> \poptracing
340 }
341 </2ekernel | package>
```

(End definition for `\getanddefine@fonts`.)

6 Scaled font extraction

`\ifnot@nil` We begin with a simple auxiliary macro. It checks whether its argument is the token `\@nil`. If so, it expands to `\@gobble` which discards the following argument, otherwise it expands to `\@firstofone` which reproduces its argument.

```
342 <*2ekernel>
343 \def\ifnot@nil#1{\def\reserved@a{#1}%
344 \ifx\reserved@a\@nnil \expandafter\@gobble
345 \else \expandafter\@firstofone\fi}
```

(End definition for `\ifnot@nil`.)

`\remove@to@nnil` Three other auxiliary macros will be needed in the following: `\remove@to@nnil` gobbles up everything up to, and including, the next `\@nnil` token, and `\remove@angles` and `\remove@star` do the same for the character `>` and `*`, respectively, instead of `\@nnil`.

```
346 \def\remove@to@nnil#1\@nnil{}
347 \def\remove@angles#1>{\set@simple@size@args}
348 \def\remove@star#1*{#1}
```

(End definition for `\remove@to@nnil`, `\remove@angles`, and `\remove@star`.)

¹⁴One might ask why this expansion does not generate a macro name that starts with an additional `\` character. The solution is that `\escapechar` is set to `-1` before `\getanddefine@fonts` is called.

`\extract@sizefn` This macro takes a size specification and parses it into size function and the optional and mandatory arguments.

```

349 \def\extract@sizefn#1*#2\@nil{%
350   \if>#2>\set@size@funct@args#1\@nil
351     \let\sizefn@info\@empty
352   \else\expandafter\set@size@funct@args\remove@star#2\@nil
353     \def\sizefn@info{#1}\fi
354   }

```

(End definition for `\extract@sizefn`.)

`\try@simple@size` This function tries to extract the given size (specified by `\f@size`) for the requested font shape. The font information must already be present in `\font@info`. The central macro that does the real work is `\extract@fontinfo`. We will first give a simple example how this macro works, and describe it in full generality later.

Assume that the requested parameters are: *encoding scheme* ‘OT1’, *family* ‘cm’, *series* ‘sansserif’, *shape* ‘normal’, and *size* ‘12’. The corresponding font definitions have already been extracted from the macro `\OT1/cm/sansserif/normal` and stored in `font@info`. (Otherwise `\extract@fontinfo` doesn’t get called.) This information consists of a token list made of characters of category code 12 of the form

```
<10*>cmss10<12*>cmss12<17*>cmss17
```

For reasonable packages one usually needs more sizes but this is sufficient to get the flavour. We will define a macro `\extract@fontinfo` to find the external font name (‘cmss12’) for us:

```

\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
  \set@simple@size@args#3<#4\@nnil
  \execute@size@function{#2}}

```

so that when it gets called via

```
\extract@fontinfo<10*>cmss10<12*>cmss12<17*>cmss17\@nnil
```

`#1` will contain all characters before `<12*>`, `#2` will be empty, `#3` will be exactly `cmss12`, and `#4` will be `17>cmss17`. The expansion is therefore

```

\set@simple@size@args cmss12<17*>cmss17\@nnil
\execute@size@function{}

```

This means: the default (empty) size function will be executed, with its optional argument set to empty and its mandatory argument set to `cmss12` by `\set@simple@size@args`. As we discussed earlier, the effect of the default size function is to load the given external font (`cmss12`) at the specified size (12)—which is exactly what was intended.

But this is only part of the whole story. It may be that the size requested does not occur in the token list `\font@info`. And the simple definition of `\extract@fontinfo` we gave above does not allow to specify give more than one size specification in front of the external font name.

Let’s address these two problems separately. The first one is solved with the following trick: We define `\extract@fontinfo` as follows:

```

\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
  \ifnot@nil{#3}%
    {\set@simple@size@args#3<#4\@nnil
      \execute@size@function{#2}%
    }%
  }%
}

```

How does this work? We call `\extract@fontinfo` via

```

\expandafter\extract@fontinfo\font@info<12*>\@nil<\@nnil

```

i.e. by appending `<12*>\@nil<\@nnil`. If the size (`'12'` in this case) appears in `\font@info` everything works as explained above, the only difference being that argument `#4` of `\extract@fontinfo` additionally gets the tokens `<12*>\@nil<\@nnil`. However, if the size is not found everything up to the final `<12*>` is in argument `#1`, `#3` gets `\@nil`, and `#2` and `#4` are empty. The macro `\ifnot@nil` will discard the calls to `\set@simple@size@args` and `\execute@size@function`, and hence `\font@info` will continue to be equal to `\@empty`. This means that no simple size specification matching the requested size could be found.

The second problem (more than one simple size specification for one external font name) will be addressed in `\set@simple@size@args` below.

The macros are hidden inside other control sequences so that we have to build `\extract@fontinfo` in several steps.

So here's the actual definition of `\extract@font` in `\try@simple@size`.

```

355 % % this could be replaced by \try@size@range making the subst slower!
356 \def\try@simple@size{%

```

`\reserved@a` is made an abbreviation for the head of the definition of the macro `\extract@fontinfo`.

```

357   \def\reserved@a{\def\extract@fontinfo####1}%

```

Now we can define `\extract@fontinfo`. Here we handle a small but convenient variation: in case of the default (empty) size function it is allowed to omit the `*` character.

```

358   \expandafter\reserved@a\expandafter<\f@size>##2<##3\@nnil{%
359     \ifnot@nil{##2}%
360       {\set@simple@size@args##2<##3\@nnil
361         \execute@size@function\sizefn@info
362       }%

```

Now we call `\extract@fontinfo`. Note the `<\@nil` tokens at the end.

```

363   \expandafter\expandafter
364   \expandafter\extract@fontinfo\expandafter\font@info
365   \expandafter<\f@size>\@nil<\@nnil
366 }

```

(End definition for `\try@simple@size`.)

`\set@simple@size@args` As promised above, the macro `\set@simple@size@args` will handle the case of several size specifications in a row. If another size specification follows, the very first token of its argument list is the character `<`. By starting the definition as follows,

```

367 \def\set@simple@size@args#1<{%

```

parameter #1 is empty in this case, and contains the size function's arguments otherwise. We distinguish these two cases (Note that the character < cannot appear in #1) by calling \remove@angles for empty #1 and \extract@sizefn otherwise. In the latter case we have to take care of the remaining character tokens and discard them. This is done by \remove@to@nnil. Note also the use of Kabelschacht's method.

```

368         \if<#1<%
369             \expandafter\remove@angles
370         \else
371             \extract@sizefn#1*\@nil
372             \expandafter\remove@to@nnil
373         \fi}

```

(End definition for \set@simple@size@args.)

Now, we are through with the case of a simple size, except for calling the size function. This will be handled later, as it is the same mechanism for all types of size specification. We will now proceed to macros for extraction of size range specification.

\extract@rangefontinfo \extract@rangefontinfo goes through a font shape definition in the input until it recognizes the tokens <\@nil->. It looks for font ranges with font size functions. It's operation is rather simple: it discards everything up to the next size specification and passes this on to \is@range for inspection. The specification (parameter #2 is inserted again, in case it is needed later.

```

374 \def\extract@rangefontinfo#1<#2>{%
375     \is@range#2->\@nil#2>}

```

(End definition for \extract@rangefontinfo.)

\is@range \is@range is again a sort of dispatcher macro: if the size specification it is looking at is not a range specification it discards it and calls \extract@rangefontinfo to continue the search. Otherwise it calls \check@range to check the requested size against the specified range.

From the way \is@range is called inside \extract@rangefontinfo we see that #2 is the character > if the size specification found is a simple one (as it does not contain a - character. This is checked easily enough and \extract@rangefontinfo called again. Note that the extra tokens inserted after the \@nil in the call to \is@range appear at the beginning of the first argument to \extract@rangefontinfo and are hence ignored.

```

376 \def\is@range#1-#2\@nil{%
377     \if>#2\expandafter\check@single\else
378     \expandafter\check@range\fi}

```

(End definition for \is@range.)

\check@range \check@range takes lower bound as parameter #1, upper bound as #2, size function as #3 and the size function's arguments as #4. If #3 is the special token \@nil \font@info is exhausted and we can stop searching.

```

379 \def\check@range#1-#2>#3<#4\@nnil{%
380     \ifnot@nil{#3}{%

```

If #3 wasn't \@nil we have a range. We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

```

381         \def\reserved@f{\extract@rangefontinfo<#4\@nnil}%

```

We have to make sure that both boundaries are present, if not we have to set them. Here we check the upper bound. If `\upper@bound` is zero after the assignment we set it to `\maxdimen` (upper open range). We need to use a *<dimen>* register for the scan since we may have a decimal number as the boundary.

```
382      \upper@bound0#2\p@
383      \ifdim\upper@bound=\z@ \upper@bound\maxdimen\fi
```

Now we check the upper boundary against `\f@size`. If it is larger or equal than `\f@size` this range is no good and we have to recurse.

```
384      \ifdim \f@size \p@<\upper@bound
```

Otherwise we have to check the lower bound. This time it is not necessary to scan the boundary value into a register because if it is empty we get zero as desired. We could even omit the 0 which would result in 1pt as default lower boundary. If `\f@size` is smaller than the boundary we have to recurse.

```
385      \lower@bound0#1\p@
386      \ifdim \f@size \p@<\lower@bound
387      \else
```

If both tests are passed we can try executing the size function.

```
388      \set@simple@size@args#3<#4\@nnil
389      \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in `\external@font`. We use this to see if we can stop scanning. Otherwise we recurse.

```
390      \ifx\external@font\@empty
391      \else
392      \let\reserved@f\@empty
393      \fi
394      \fi
395      \fi
396      \reserved@f}}
```

(End definition for `\check@range`.)

`\lower@bound` We use two dimen registers `\lower@bound` and `\upper@bound` to store the lower and
`\upper@bound` upper endpoints of the range we found.

```
397 \newdimen\lower@bound
398 \newdimen\upper@bound
```

(End definition for `\lower@bound` and `\upper@bound`.)

`\check@single` `\check@single` takes the size as parameter #1, size function as #2 and the size function's arguments as #3. We can assume that there is always something in the pipeline since the very last entry is a faked range (see above).

```
399 \def\check@single#1>#2<#3\@nnil{%
```

We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

```
400      \def\reserved@f{\extract@rangefontinfo<#3\@nnil}%
```

Now we check the size against `\f@size`. If it is not equal `\f@size` it is no good and we have to recurse.

```
401      \ifdim \f@size \p@=#1\p@
```

Otherwise if this test is passed we can try executing the size function.

```
402      \set@simple@size@args#2<#3\@nnil
403      \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in `\external@font`. We use this to see if we can stop scanning. Otherwise we recurse.

```
404      \ifx\external@font\@empty
405      \else
406      \let\reserved@f\@empty
407      \fi
408      \fi
409      \reserved@f}
```

(End definition for \check@single.)

\set@size@funct@args This macro sets the optional and mandatory arguments for a size function. If the optional argument is not present it is set to the empty token list. The mandatory argument is delimited by the token `\@nil`.

```
410 \def\set@size@funct@args{\@ifnextchar[%
411   \set@size@funct@args@\set@size@funct@args@[]]}
412 \def\set@size@funct@args@[#1]#2\@nil{%
413   \def\mandatory@arg{#2}%
414   \def\optional@arg{#1}}
415 \</2ekernel>
```

(End definition for \set@size@funct@args and \set@size@funct@args@.)

\DeclareSizeFunction This function defines a new size function hiding the internal from the designer. The body of the size function may use `\optional@arg` and `\mandatory@arg` denoting the optional and mandatory argument that may follow the size specification `<...>`.

```
416 \<2ekernel>
417 \def\DeclareSizeFunction#1#2{\@namedef{s@fct@#1}{#2}}
418 \@onlypreamble\DeclareSizeFunction
419 \</2ekernel>
```

(End definition for \DeclareSizeFunction.)

\execute@size@function This macro is very simple. The only point worth noting is that calling an undefined size function will do nothing (actually execute a `\relax`).

```
420 \<2ekernel | package>
421 \def\execute@size@function#1{%
422 \<*trace>
423     \ifundefined{s@fct@#1}%
424     {\errmessage{Undefined font size function #1}%
425     \s@fct@}%
426     {\csname s@fct@#1\endcsname}%
427 \</trace>
428 \<-trace>     \csname s@fct@#1\endcsname
429 }
430 \</2ekernel | package>
```

(End definition for \execute@size@function.)

`\try@size@range` This macro tries to find a suitable range for requested size (specified by `\f@size`) in `\font@info`. All the relevant action is done in `\extract@rangefontinfo`. All that needs to be done is to stuff in the token list in `\font@info` so that `\extract@rangefontinfo` can inspect it. Note the `<-*\@nil>` token at the end to stop scanning.

```

431 {*2ekernel}
432 \def\try@size@range{%
433     \expandafter\extract@rangefontinfo\font@info <-*\@nil<\@nnil
434 }

```

(End definition for \try@size@range.)

`\try@size@substitution` This is the last thing that can be tried. If the desired `\f@size` is found neither among the simple size specifications nor in one of the ranges the whole list of size specifications is searched for a nearby simple size.

```

435 \gdef\try@size@substitution{%

```

First we do some initializations. `\@tempdimb` will hold the difference between the wanted size and the best solution found so far, so we initialise it with `\maxdimen`. The macro `\best@size` will hold the best size found, nothing found is indicated by the empty value.

```

436     \@tempdimb \maxdimen
437     \let \best@size \empty

```

Now we loop over the specification

```

438     \expandafter \try@simples \font@info <\number\@M>\@nil<\@nnil
439 }

```

(End definition for \try@size@substitution.)

`\font@submax` The macro `\font@submax` records the maximal deviation from the desired size encountered so far. Its value is used in a warning message at `\end{document}`. The macro `\fontsubfuzz` contains the amount that will not cause terminal warnings (warnings still go into the transcript file).

```

440 \def\font@submax{0pt}
441 \def\fontsubfuzz{.4pt}
442 {/2ekernel}
443 {+package}\def\fontsubfuzz{0pt}

```

(End definition for \font@submax and \fontsubfuzz.)

`\try@simples` `\try@simples` goes through a font shape definition in the input until it recognizes the tokens `<*\@nil>`. It looks for simple sizes to determine the two closest sizes. It is assumed that simple sizes are in increasing order.

```

444 {*2ekernel}
445 \gdef\try@simples#1<#2>{%
446     \tryif@simple#2->\tryif@simple}

```

(End definition for \try@simples.)

`\tryis@simple` `\tryis@simple` is similar to `\is@range`. If it sees a simple size, it checks it against the value of `\f@size` and sets `\lower@font@size` or `\higher@font@size`. In the latter case, it stops the iteration. By adding `<\number\@M>` at the end of the line we always have an end point. This is a hack which probably should be corrected.

First it checks whether it is finished already, then whether the size specification in question is a simple one.

```

447 \gdef\tryif@simple#1-#2\tryif@simple{%

```

Most common case for `\reserved@f` first:

```
448 \let \reserved@f \try@simples
449 \if>#2%
```

If so, it compares it to the value of `\f@size`. This is done using a `dimen` register since there may be fractional numbers.

```
450 \dimen@ #1\p@
451 \ifdim \dimen@<\M\p@
```

If `\dimen@` is `\M\p@` we have reached the end of the fontspec (hopefully) otherwise we compare the value with `\f@size` and compute in `\@tempdimc` the absolute value of the difference between the two values.

```
452 \ifdim \f@size\p@<\dimen@
453 \@tempdimc \dimen@
454 \advance\@tempdimc -\f@size\p@
455 \else
456 \@tempdimc \f@size\p@
457 \advance\@tempdimc -\dimen@
458 \fi
```

The result is then compared with the smallest difference we have encountered, if the new value (in `\@tempdimc` is smaller) we have found a size which is a better approximation so we make it the `\best@size` and adjust `\@tempdimb`.

```
459 \ifdim \@tempdimc<\@tempdimb
460 \@tempdimb \@tempdimc
461 \def \best@size{#1}%
462 \fi
```

When we have reached the end of the fontspec we substitute the best size found (if any). We code this inline to save macro space; in the past this was done by a macro called `\subst@size`.

```
463 \else
```

This macro substitutes the size recorded in `\best@size` for the unavailable size `\f@size`. `\subst@size` `\font@submax` records the maximum difference between desired size and selected size in the whole run.

```
464 % \subst@size %% coded inline
465 % \def\subst@size{%
466 \ifx \external@font\@empty
467 \ifx \best@size\@empty
468 \else
469 \ifdim \@tempdimb>\font@submax \relax
470 \xdef \font@submax {\the\@tempdimb}%
471 \fi
472 \let \f@user@size \f@size
473 \let \f@size \best@size
474 \ifdim \@tempdimb>\fontsubfuzz\relax
475 \@font@warning{Font\space shape\space
476 '\curr@fontshape'\space in\space size\space
477 <\f@user@size>\space not\space available\MessageBreak
478 size\space <\f@size>\space substituted}%
479 \fi
480 \try@simple@size
481 \do@subst@correction
```

```

482     \fi
483 \fi
484 % %}

```

This brings us back into the main part of `\tryif@simple`. Finally we get rid of any rubbish left over on the input stack.

```

485     \let \reserved@f \remove@to@nnil
486     \fi
487 \fi

```

If it's a range iterate also.

```

488 \reserved@f}

```

(End definition for \tryis@simple and \subst@size.)

6.1 Sizefunctions

In the following we define some useful size functions.

`\s@fct@` This is the default size function. Mandatory argument is an external font name, optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

489 \DeclareSizeFunction{}{\empty@sfcnt\@font@warning}
490 \DeclareSizeFunction{s}{\empty@sfcnt\@font@info}
491 \def\empty@sfcnt#1{%
492     \@tempdimb \f@size\p@
493     \ifx\optional@arg\@empty
494     \else
495         \@tempdimb \optional@arg\@tempdimb
496         #1{Font\space shape\space '\curr@fontshape'\space
497             will\space be\MessageBreak
498             scaled\space to\space size\space \the\@tempdimb}%
499     \fi
500     \edef\external@font{\mandatory@arg\space at\the\@tempdimb}}

```

(End definition for \s@fct@.)

`\s@fct@gen` This size function generates the external name from the mandatory argument and the requested user size, and thus can be used for external names where the size is encoded in the font name. The optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

`\s@fct@sgen`

```

501 \DeclareSizeFunction{gen}{\gen@sfcnt\@font@warning}
502 \DeclareSizeFunction{sgen}{\gen@sfcnt\@font@info}
503 \def\gen@sfcnt{%
504     \edef\mandatory@arg{\mandatory@arg\f@size}%
505     \empty@sfcnt}

```

(End definition for \s@fct@gen and \s@fct@sgen.)

`\sfct@genb` This size function is similar to `gen`, but for fonts where the size is encoded in the font name in centipoints, as in the DC fonts version 1.2. The font is scaled to `\f@size` if `\sfct@sgenb` no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```
506 \DeclareSizeFunction{genb}{\genb@sfcnt\@font@warning}
507 \DeclareSizeFunction{sgenb}{\genb@sfcnt\@font@info}

508 \def\genb@sfcnt{%
509     \edef\mandatory@arg{\mandatory@arg\expandafter\genb@x\f@size..\@{}}%
510     \empty@sfcnt}
```

(End definition for `\sfct@genb` and `\sfct@sgenb`.)

`\genb@x` The auxiliary macros `\genb@x` and `\genb@y` are used to convert the `\f@size` into centi-
`\genb@y` points.

```
511 \def\genb@x#1.#2.#3\@{\two@digits{#1}\genb@y#200\@{}}
512 \def\genb@y#1#2#3\@{\#1#2}
```

(End definition for `\genb@x` and `\genb@y`.)

`\sfct@sub` This size function handles font substitution. The mandatory argument is a family/series/shape combination, the optional argument (if present) is ignored. The font encoding scheme cannot be changed. Therefore, the first thing we do is to prepend the encoding scheme.

```
513 \DeclareSizeFunction{sub}{\sub@sfcnt\@font@warning}
514 \DeclareSizeFunction{ssub}{\sub@sfcnt\@font@info}

515 \def\sub@sfcnt#1{%
516     \edef\mandatory@arg{\f@encoding/\mandatory@arg}%
```

Next action is split the arg into its individual components and allow for a late font shape load.

```
517 \begingroup
518 \expandafter\split@name\mandatory@arg/\@nil
519 \try@load@fontshape
520 \endgroup
```

Then we record the current `\f@size` since it may get clobbered.

```
521 \let\f@user@size\f@size
```

Then we check whether this new combination is defined and give an error message if not. In this case we also switch to `\error@fontshape`.

```
522 \expandafter
523 \ifx\csname\mandatory@arg\endcsname\relax
524     \errmessage{No\space declaration\space for\space
525               shape\space \mandatory@arg}%
526     \error@fontshape
527 \else
```

Otherwise we warn the user about the substitution taking place.

```
528     #1{Font\space shape\space '\curr@fontshape'\space in\space
529       size\space <\f@size>\space not\space available\MessageBreak
530       Font\space shape\space '\mandatory@arg'\space tried\space
531       instead}%
532     \expandafter\split@name\mandatory@arg/\@nil
533 \fi
```

Then we restart the font specification scan by calling `\get@external@font`.

```
534 \edef\font@size{\font@user@size}%
535 \get@external@font
```

Finally `\do@subst@correction` is called to get the font name right.

```
536 \do@subst@correction
537 }
```

(End definition for \sfct@sub.)

`\font@aliasinfo` Sometimes a substitution is only done to map a long font name to a standard shape or series, e.g.,

```
DeclareFontShape{T1}{Roboto-LF}{b}{it}{<-> alias * Roboto-LF/bold/it}{}
```

Using the `ssub` function in that case will give a strange (and incorrect) warning. As an alternative we therefore offer the size function `alias`. It will still add some info into the `.log` file, but no longer complains that the font shape is not available. It is implemented by grabbing the default warning text and replacing it with a new one.

```
538 </2ekernel>
539 <*2ekernel | latexrelease>
540 <latexrelease>\IncludeInRelease{2020/02/02}%
541 <latexrelease>{\font@aliasinfo}{alias size function}%
542 \DeclareSizeFunction{alias}{\sub@sfcnt\font@aliasinfo}
543 \def\font@aliasinfo#1{%
544 \font@info{Font\space shape\space '\curr@fontshape'\space
545 aliased\space to\MessageBreak '\mandatory@arg'}%
546 }
547 </2ekernel | latexrelease>
548 <latexrelease>\EndIncludeInRelease
549 <latexrelease>\IncludeInRelease{0000/00/00}%
550 <latexrelease>{\font@aliasinfo}{alias size function}%
551 <latexrelease>\let\sfct@alias\undefined
552 <latexrelease>\let\font@aliasinfo\undefined
553 <latexrelease>
554 <latexrelease>\EndIncludeInRelease
555 <*2ekernel>
```

(End definition for \font@aliasinfo.)

`\sfct@subf` The `subf` size function allows substitution of another font. The mandatory argument is the external name of the font to be substituted, the optional argument a size scaling factor like in the default size function. The main difference to the default size function is the warning message.

```
556 \DeclareSizeFunction{subf}{\sub@sfcnt\font@warning}
557 \DeclareSizeFunction{ssubf}{\sub@sfcnt\font@info}
558 \def\sub@sfcnt#1{%
559 #1{Font\space shape\space '\curr@fontshape'\space in\space
560 size\space \font@size\space not\space available\MessageBreak
561 external\space font\space '\mandatory@arg'\space used}%
562 \empty@sfcnt#1%
563 }
```

(End definition for \sfct@subf.)

`\s@fct@fixed` The `fixed` size function is for using a font at a different size than requested. A warning message is printed, and the external font to be used is taken from the mandatory argument. If an optional argument is present it is used as the ‘at’ size for the font. Otherwise the font is loaded at its design size.

```

564 \DeclareSizeFunction{fixed}{\fixed@sfcnt\@font@warning}
565 \DeclareSizeFunction{sfixed}{\fixed@sfcnt\@font@info}

566 \def\fixed@sfcnt#1{%
567   \ifx\optional@arg\@empty
568     \let\external@font\mandatory@arg
569   \else
570     \edef\external@font{\mandatory@arg\space at\optional@arg pt}%
571   \fi
572   #1{External\space font\space ‘\external@font’\space loaded\space
573     for\space size\MessageBreak
574     <\f@size>}%
575 }
576 \</2ekernel>

```

(End definition for \s@fct@fixed.)

File v

ltfsscmp.dtx

This file contains the implementation of commands giving compatibility with the original ‘NFSS1’ release of the Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

Version 1 of NFSS is obsolete now for about 20 years (and was “current” only for a short intermediate time) so with the 2015 release these internal interface commands are removed from the kernel and made available via `latexrelease` package so that backward compatibility remains ensured for very old documents.

```
1 (*latexrelease)
2 \IncludeInRelease{2015/01/01}{\new@fontshape}%
3                                     {NFSS version1 commands}%
4 \let\new@fontshape\@undefined
5 \let\warn@rel@i\@undefined
6 \let\scan@fontshape\@undefined
7 \let\scan@@fontshape\@undefined
8 \let\subst@fontshape\@undefined
9 \let\extra@def\@undefined
10 \let\default@mextra\@undefined
11 \let\preload@sizes\@undefined
12 \let\err@rel@i\@undefined
13 \let\newmathalphabet\@undefined
14 \let\newmathalphabet@\@undefined
15 \let\newmathalphabet@@@\@undefined
16 \let\if@no@font@opt\@undefined
17 \let\@no@font@optfalse\@undefined
18 \let\define@mathalphabet\@undefined
19 \let\define@mathgroup\@undefined
20 \let\addtoversion\@undefined
21 \EndIncludeInRelease
```

In older releases we provide the original definitions.

```
22 \IncludeInRelease{0000/00/00}{\new@fontshape}%
23                                     {NFSS version1 commands}%
```

`\new@fontshape` The interface is now `\DeclareFontShape`.

```
24 \gdef\new@fontshape#1#2#3#4{%
25     \warn@rel@i\new@fontshape\DeclareFontShape
26     \expandafter\scan@fontshape\@gobble#4<\@nil><<%
27     \DeclareFontShape U{#1}{#2}{#3}\reserved@f}%
28 \@onlypreamble\new@fontshape
```

(End definition for \new@fontshape.)

`\warn@rel@i` The warning message used above.

```
29 \gdef\warn@rel@i#1#2{%
30     \@font@warning{*** NFSS release 1 command
```

```

31          \noexpand#1found\MessageBreak
32      *** Update by using release 2 command
33          \string#2.\MessageBreak
34      *** Recovery is probably possible}%
35 }%
36  \@onlypreamble\warn@rel@i

```

(End definition for \warn@rel@i.)

\scan@fontshape This will scan the old font shape definition syntax.

```

37  \gdef\scan@fontshape{%
38      \let\reserved@f\@empty
39      \let\reserved@e\@empty %           holds last info

File w

ltfssdcl.dtx

This file contains the main implementation of the font selection scheme commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of these commands.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

1 Interface Commands

`\in@` `\@in` is a utility macro with two arguments. It determines whether its first argument occurs in its second and sets the switch `\ifin@` accordingly. The first argument may not contain braces nor # (more precisely, tokens of category code 1, 2, or 6).

```

1 <*2kernel>
2 \def\in@#1#2%
3 {%
4   \begingroup
5     \def\in@@##1#1{%
6       \toks@\expandafter{\in@@#2{}}#1}%
7     \edef\in@@{\the\toks@}%
8     \expandafter\endgroup
9     \ifx\in@@\@empty
10      \in@false
11    \else
12      \in@true
13    \fi
14  }
15 \newif\ifin@

```

(End definition for `\in@` and `\ifin@`.)

Before the `\begin{document}` command several *math versions* and *math alphabet identifiers* may be declared. In principle, there should be exactly one family/series/shape combination be declared for each version/alphabet pair. But we want to allow for defaults as well for automagical filling of holes.

While building the tables for math alphabet identifiers and math versions we keep several lists:

- the list of all math versions, `\version@list`, each entry prefixed by the control sequence `\version@elt`, i.e. this list has the following form

```

\version@elt<version1>\version@elt<version2>...
\version@elt<versionn>

```

- the list of all math alphabet identifiers. Here every entry has the form:

```

\group@elt<math group number>
{\{<default family>\}{<default series>\}{<default shape>}}.

```

- Each defined math alphabet identifier holds a list containing Information about the *versions* for which it is defined. This list has a more complicated structure: it looks as follows:

```

\set@alpha<the alphabet identifier itself>
\reserved@c<math version><font info>
...
\@nil

```

where ** is either `\reserved@e` (if the combination is not defined yet) or

```
{\family}{\series}{\shape}}
```

`\version@list` We initialize the version list to be empty.

```

16 \let\version@list=\@empty
17 \@onlypreamble\version@list

```

(End definition for `\version@list`.)

`\version@elt`

```

18 \let\version@elt\relax
19 \@onlypreamble\version@elt

```

(End definition for `\version@elt`.)

`\new@mathversion` The macro `\new@mathversion` is called with the version control sequence as its argument.

```

20 %\def\new@mathversion#1{%

```

The first thing this macro does is to check if the version identifier is already present in `\version@list`. We enclose `\version@list` in braces since it might be empty (if no *version* is defined yet). But this means that we need a suitable number of `\expandafter` primitives.

```

21 % \expandafter\in@\expandafter#1\expandafter{\version@list}%
22 % \ifin@

```

If so it prints an error message. The `\next` macro is used to get rid of the four characters `\mv@` that would otherwise appear at the begin of the version name in the error message.

```

23 % \latex@error{Math version
24 % '\expandafter\@gobblefour\string#1'
25 % already defined}\@eha

```

Otherwise we have a new version, and we can proceed with entering it into the tables. We add it to `\version@list`. This is very easy: we define `\version@elt` (which is the delimiter in `\version@list`) to protect itself and the following token from being expanded and simply redefine `\version@list`.

```

26 % \else
27 % \global\expandafter\newcount\csname c@\expandafter
28 % \gobble\string#1\endcsname
29 % \global\csname c@\expandafter
30 % \gobble\string#1\endcsname\@ne
31 % \def\version@elt{\noexpand\version@elt\noexpand}%
32 % \edef\version@list{\version@list\version@elt#1}%

```

Then we prepare to enter the new version into all math alphabet identifier lists. Remember that these lists use `\reserved@c` as delimiter, and that there appears the control sequence `\reserved@e` that must not be expanded. Therefore we take suitable precautions.

```
33 %      \def\reserved@c{\noexpand\reserved@c\noexpand}%
34 %      \let\reserved@e\relax
```

We will now go through the `\alpha@list` to process every *math alphabet identifier* in turn. Since this list has `\group@elt` as a delimiter we define this control sequence. It has three arguments as every entry consists of three items (as explained above).

```
35 %      \def\group@elt##1##2##3{%
```

The first of these arguments is the *math alphabet identifier*. We redefine it by appending the information about the new version at the end of the list contained in it. However, there is one subtlety: the definitions for `\reserved@c` and `\reserved@e` made above prevent the main part of the list from being expanded. But we still have to take care of the header and the trailer. To do this we remove the trailer by means of the macro `\remove@nil` which also protect the header from being expanded. Its definition is given below. Now we can prepare to add the new version.

```
36 %          \edef##1{\expandafter\remove@nil##1%
37 %              \reserved@c
38 %              #1%
39 %              \reserved@e
40 %              \noexpand\@nil}}%
```

Finally we call `\alpha@list` which will now execute the macro `\group@elt` once for every defined *math alphabet identifier*. And that's all for now.

```
41 %      \alpha@list
42 %  \fi}
```

(End definition for `\new@mathversion`.)

`\alpha@list` As we explained above every entry in `\alpha@list` has the form
`\alpha@elt`
*alphabet identifier**internal group number**default font assignments*...
We initialize it to `\@empty`.

```
43 \let\alpha@list\@empty
44 \@onlypreamble\alpha@list
```

(End definition for `\alpha@list`.)

`\alpha@elt`

```
45 \let\alpha@elt\relax
46 \@onlypreamble\alpha@elt
```

`\newgroup` Start the group (fam) allocation at 0. (Doesn't belong here.)

```
47 \count18=-1
```

(End definition for `\newgroup`.)

`\stepcounter`

(End definition for `\stepcounter`.)

`\select@group` We surround `\select@group` with braces so that functions using it can be used directly after `_` or `^`. However, if we use oldstyle syntax where the math alphabet doesn't have arguments (ie if `\math@bgroup` is not `\bgroup`) we need to get rid of the extra group.

```

(End definition for \DeclareMathDelimiter.)

\@xxDeclareMathDelimiter

This macro checks if the second arg is a “math type” such as `\mathopen`. The undocumented original code didn’t use math types when the delimiter was a single letter. For this reason the coding is a bit strange as it tries to support the undocumented syntax for compatibility reasons.

```
790 \def\@xxDeclareMathDelimiter#1#2#3#4{%
```

7 is the default value returned in the case that `\mathchar@type` is passed something unexpected, like a math symbol font name. We locally move `\mathalpha` out of the way so if you use that the right branch is taken. This will still fail if an explicit number 7 is used!

```
791 \begingroup
792   \let\mathalpha\mathord
793   \ifnum7=\mathchar@type{#2}%
794     \endgroup
```

If this branch is taken we have old syntax (5 arguments).

```
795     \expandafter\@firstofone
796   \else
```

If this branch is taken `\mathchar@type` is different from 7 so we assume new syntax. In this case we also use the arguments to set up the letter as a math symbol for the case where it is not used as a delimiter.

```
797      \endgroup
798      \DeclareMathSymbol#1{#2}{#3}{#4}%
```

Then we arrange that `\@xDeclareMathDelimiter` only gets #1, #3, #4 ... as it does not expect a math type as argument.

```

First check if #2 is known to be a symbol font
997   \expandafter\in@\csname sym#2\expandafter\endcsname
998   \expandafter{\group@list}%
999   \ifin@
Check if #1 is defined as a math alphabet defined via \DeclareMathAlphabet:
1000   \expandafter\in@\expandafter#1\expandafter{\alpha@list}%
1001   \ifin@
If so remove it from the \alpha@list and from all math version macros.
1002   \@font@info{Redeclaring math alphabet \string#3}%
1003   \toks@{}%
1004   \def\alpha@elt##1##2##3{%
1005     \ifx##1#1\else\addto@hook\toks@{\alpha@elt##1##2##3}\fi}%
1006   \alpha@list
1007   \xdef\alpha@list{\the\toks@}%

```

Now we loop over all versions and remove the math alphabet:

```

1008     \def\version@elt##1{%
1009         \begingroup
1010         \toks@{}%
1011         \def\getanddefine@fonts####1####2{%
1012             \addto@hook\toks@{\getanddefine@fonts####1####2}}%
1013         \def\install@mathalphabet####1####2{%
1014             \ifx####1#1\else
1015                 \addto@hook\toks@{\install@mathalphabet
1016                                     ####1{####2}}\fi}%
1017         ##1%
1018         \xdef##1{\the\toks@}%
1019     \endgroup
1020 }%
1021 \version@list
1022 \else

```

If #3 is not defined as a math alphabet check if it is defined at all:

```

1023     \expandafter\ifx
1024     \csname\expandafter\@gobble\string#1\space\endcsname
1025     \relax

```

If it is undefined, fine otherwise check if it is a math alphabet defined via `\DeclareSymbolFontAlphabet`:

```

1026     \else
1027         \edef\reserved@a{%
1028             \noexpand\in@{\string\use@mathgroup}{\meaning#1}}%
1029         \reserved@a
1030         \ifin@
1031             \@font@info{Redeclaring math alphabet \string#3}%
1032         \else

```

Since the command #3 is defined to be something which is not a math alphabet we have to skip redefining it.

```

1033         \@tempswafalse
1034         \@latex@error{Command ‘\string#3’ already defined}\@eha
1035     \fi
1036 \fi
1037 \fi
1038 \else

```

Since the symbol font is not known we better skip defining this alphabet.

```

1039     \@tempswafalse
1040     \@latex@error{Unknown symbol font ‘#2’}\@eha
1041 \fi
1042 \if@tempswa

```

When we reach this point we are allowed to define #1 to be a symbol font math alphabet. This means that we have to set it to

`\use@mathgroup <math-settings> \sym<name>`

The `<math-settings>` are the one for the encoding that is used in the font shape where `\sym<name>` is pointing to. This means that we have to get it from the information stored in `\group@list`. Thus we loop through that list after defining `\group@elt` in a suitable way.

```

1043 \def\group@elt##1##2{%
1044     \expandafter\ifx\csname sym#2\endcsname##1%
1045     \expandafter\reserved@a\string##2\@nil
1046     \fi}%
1047 \def\reserved@a##1##2/##3\@nil{%
1048     \def\reserved@a{##2}}%
1049 \group@list
1050 \toks@{\relax\ifmmode \else \non@alpherr#1\fi}%
1051 \edef#1{\the\toks@
1052     \noexpand\use@mathgroup
1053     \expandafter\noexpand\csname M@\reserved@a\endcsname
1054     \csname sym#2\endcsname}%
1055 \def#3{\protect#1}%
1056 \fi
1057 }
1058 \@onlypreamble\DeclareSymbolFontAlphabet@
1059 </2ekernel>

```

(End definition for \DeclareSymbolFontAlphabet@.)

File x

ltfssini.dtx

This file contains the top level L^AT_EX interface to the font selection scheme commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of these commands.

1 NFSS Initialization

Finally, there are six commands that are to be used in L^AT_EX and that we will therefore protect against expansion at the wrong point: `\fontfamily`, `\fontseries`, `\fontshape`, `\fontsize`, `\selectfont`, and `\mathversion`.

```
1 \langle*2ekernel\rangle
```

1.1 Providing math *versions*

L^AT_EX provides two *versions*. We call them *normal* and *bold*, respectively.

```
2 \DeclareMathVersion{normal}
3 \DeclareMathVersion{bold}
```

Now we define the standard font change commands. We don't allow the use of `\rmfamily` etc. in math mode.

(Actually most are now defined further down in the file.)

First the changes to another *family*:

```
4 %\DeclareRobustCommand\rmfamily
5 %      {\not@math@alphabet\rmfamily\mathrm
6 %      \fontfamily\rmdefault\selectfont}
7 %\DeclareRobustCommand\sffamily
8 %      {\not@math@alphabet\sffamily\mathsf
9 %      \fontfamily\sfddefault\selectfont}
10 %\DeclareRobustCommand\ttfamily
11 %      {\not@math@alphabet\ttfamily\mathtt
12 %      \fontfamily\ttdefault\selectfont}
```

Then the commands changing the *series*:

```
13 %\DeclareRobustCommand\bfseries
14 %      {\not@math@alphabet\bfseries\mathbf
15 %      \fontseries\bfdefault\selectfont}
16 %\DeclareRobustCommand\mdseries
17 %      {\not@math@alphabet\mdseries\relax
18 %      \fontseries\mddefault\selectfont}
19 \DeclareRobustCommand\upshape
20      {\not@math@alphabet\upshape\relax
21      \fontshape\updefault\selectfont}
```

Then the commands changing the *shape*:

```
22 \DeclareRobustCommand\slshape
23      {\not@math@alphabet\slshape\relax
24      \fontshape\sldefault\selectfont}
25 \DeclareRobustCommand\scshape
26      {\not@math@alphabet\scshape\relax
```

```

27         \fontshape\scdefault\selectfont}
28 \DeclareRobustCommand\itshape
29     {\not@math@alphabet\itshape\mathit
30     \fontshape\itdefault\selectfont}

```

2 Custom series settings for main document families

This section was introduced 2020/02/02 and for now we support a full rollback (may need splitting later).

```

31 </2ekernel>
32 <*2ekernel | latexrelease>
33 <latexrelease>\IncludeInRelease{2020/02/02}%
34 <latexrelease>          {\DeclareFontSeriesDefault}{Custom series}%

```

One problem with the NFSS approach of handling the series axis turned out to be that (especially with respect to “boldness”) different font families implemented different strategies. For example, with Computer Modern fonts you normally only have **bx** whereas most PostScript fonts offered only **b** but not **bx**. As a result L^AT_EX’s standard setting for `\bfdefault` didn’t work with such fonts, but if it got changed to produce **b**, then that didn’t work with Computer Modern if the fonts got combined (e.g., using Computer Modern Typewriter with such fonts).

The solution back then was to provide substitution rules in the font `.fd` such that if a **bx** series got requested the **b** series got used. While this works in that particular case, it isn’t a very general solution. For example, if you happen to have a font family that has several weights you may want to typeset the whole document in a somewhat lighter or darker font but if you then modify `\mddefault` to allow for this, then of course your change only works with that particular family but not with the typewriter or sans serif family you also want to use.

A better solution was provided by the `mweights` package by Bob Tennent that offers defaults on the level of the three main font families in the document: for “rm”, “sf” and “tt” so that font packages could define defaults for the sans serif document font by providing `\bfseries@sf` which then was used when `\bfseries` got executed and the current family was the `\sffamily`.

`\DeclareFontSeriesDefault`

We now support this concept directly from within L^AT_EX and for use in font packages (or the document preamble) we offer `\DeclareFontSeriesDefault`. This declaration takes three arguments:

document family interface: Can either be `rm`, `sf` or `tt`. This is optional and if not given the overall default.

document series interface: Can be `md` or `bf`.

series value: This is the value that is going to be used with the combination is requested.

For example, `\DeclareFontSeriesDefault[rm]{bf}{sb}` would use **sb** (semi-bold) when `\rmfamily \bfseries` is asked for.

If used without the optional argument, e.g., `\DeclareFontSeriesDefault{bf}{b}` then this is like redefining `\bfdefault` or `\mddefault`.

If some family specific defaults aren't given, e.g. if there are no declarations for, say, `tt` then the format defaults of `\mddefault` and `\bfdefault` are assumed. If those are later changed this is *not* reflected!¹⁵

`\DeclareFontSeriesDefault` The command to declare font series defaults for the “rm”, “sf” or “tt” family.

```

35 \let\DeclareFontSeriesDefault\@undefined      % for rollback
36 \newcommand\DeclareFontSeriesDefault[3][]{%
37   \def\reserved@a{#1}%

```

No optional argument: set up general default.

```

38   \ifx\reserved@a\@empty
39     \ifcsname #2series\endcsname                % supported are
40                                           % \[md/bf]default

```

Adding `\@empty` allows us to detect if the default gets redefined with `\renewcommand` or `\def` by the user.

```

41     \expandafter\def
42       \csname #2default\endcsname{#3\@empty}%
43     \expandafter\def
44       \csname #2default@previous\endcsname{#3\@empty}%
45   \else
46
47     \@latex@error{Wrong syntax for \string\DeclareFontSeriesDefault}%
48     {Mandatory first argument must be 'md' or 'bf'.}
49   \fi

```

Optional argument given, set up specific default.

```

49   \else
50     \ifcsname #2series@#1\endcsname              % supported are
51                                           % \[md/bf]series@[rm/sf/tt]
52     \expandafter\edef
53       \csname #2series@#1\endcsname{#3}%

```

If the interface is used we remove the frozen kernel default. This way, we know that something was explicitly set up (even if the setup has the same value as the default).

```

54     \expandafter\let
55       \csname #2series@#1@kernel\endcsname\@undefined
56   \else
57     \@latex@error{Wrong syntax for \string\DeclareFontSeriesDefault}%
58     {Optional argument must be 'rm', 'sf', or 'tt'. \MessageBreak
59       Mandatory first argument must be 'md' or 'bf'.}
60   \fi
61 \fi
62 }

```

(End definition for `\DeclareFontSeriesDefault`.)

`\mdseries@rm` We initialize the family specific default at the end of the format generation. Later on they may get overwritten in the preamble or a package via `\DeclareFontSeriesDefault` (or possibly directly).

`\mdseries@sf` Conceptual change: The `\bfdefault` will be `b` not `bx` because that is what it should be really for nearly every font except Computer/Latin Modern.

`\mdseries@tt`

¹⁵I see no easy way to achieve this without compromising compatibility with existing packages that currently use `mweights` and directly define (some) of the `\mdseries@...` commands but not others.

To account for the fact that by default we typeset in CM or LM we set up the `\bfseries@..` defaults to use `bx` instead.

This means that it behaves like before because if the default fonts are used then `\bfseries@rm` etc kick in and make `\textbf` use `bx`. However, if the font gets changed then `\bfdefault` will get used.

```
63 \def\bfseries@rm{bx}
64 \def\bfseries@sf{bx}
65 \def\bfseries@tt{bx}
```

Frozen version of the kernel defaults so we can see if they have changed.

```
66 \let\bfseries@rm@kernel\bfseries@rm
67 \let\bfseries@sf@kernel\bfseries@sf
68 \let\bfseries@tt@kernel\bfseries@tt
```

The default for the medium series is `m` and this will be interpreted as resetting both weight and width. To reset only one of them the virtual value `?m` and `m?` are available.

```
69 \def\mdseries@rm{m}
70 \def\mdseries@sf{m}
71 \def\mdseries@tt{m}
```

(End definition for \mdseries@rm and others.)

`\series@change@debug` For debugging, but right now none of this code is extracted. The idea is to have a separate package with debugging code one day.

```
72 \*debug
73 \let\series@change@debug\typeout
74 \let\series@change@debug\@gobble
75 \end*debug
```

(End definition for \series@change@debug.)

`\prepare@family@series@update` This is core command that prepares for the family update. The big difference to the documented code above is that the nested `\ifx` statements seem to be missing. Instead we loop through an internal list that holds the names of the three meta families. This approach allows us to extend the mechanism at a later stage to allow for additional named meta families.

Here is the current definition of that list:

```
\@meta@family@list
76 \def\@meta@family@list{\@elt{rm}\@elt{sf}\@elt{tt}}

77 \def\prepare@family@series@update#1#2{%

78   \if@forced@series
79   \<+debug> \series@change@debug{No series preparation (forced \f@series)\on@line}%
80     \fontfamily#2%
81   \else
82   \<+debug> \series@change@debug{Preparing for switching to #1 (#2)\on@line}%
83     \expand@font@defaults
```

We prepare for changing the current series. We have to find it before changing the family as discussed above.

```
84   \let\target@series@value\@empty
85   \def\target@meta@family@value{#1}%
```

As the very last item in the meta family list we add `\@elt{??}` and define this pseudo meta family to be the current font family. So if none of the real meta families matched then this will match. This will cover the following case:

- `\bfseries` is called for a family using `bx` (e.g., CMR)
- Switch to a font family that is none of the meta families, e.g., via `\fontfamily{ptm}\allowbreak\vf`
- Then none of the real meta families, match but the final `\@elt{??}` will.
- Therefore if the current series is `\mddefault` or `\bfdefault` it will be detected and the corresponding target series selected.

```
86 \expandafter\edef\csname ??def@ult\endcsname{\f@family}%
```

To find it we loop over the meta family list with a suitable definition of `\@elt`.

```
87 \let\@elt\update@series@target@value
88 \@meta@family@list
```

Last resort pseudo meta family. Will only be looked at if none of the real ones have matched.

```
89 \@elt{??}%
90 \let\@elt\relax
```

That will figure out the correct series value to use without updating it. Now we can change the family.

```
91 \fontfamily#2%
```

After that we update the series. That code is again like the one above.

```
92 \ifx\target@series@value\@empty
93 <+debug> \series@change@debug{Target series still empty ...}%
94 \else
95 \ifx \f@series\target@series@value
96 <+debug> \series@change@debug{Target series unchanged:
97 <+debug> \f@series \space = \target@series@value}%
98 \else
99 \maybe@load@fontshape
100 <+debug> \series@change@debug{Target series:
101 <+debug> \f@series \space -> \target@series@value}%
```

The `\target@series@value` may contain something like `cm` (coming from a default) and so we can't directly assign it to `\f@series` we have to drop any surplus `m` first.

```
102 % \let\f@series\target@series@value
103 \series@maybe@drop@one@m\target@series@value\f@series
104 \fi
105 \fi
106 \fi
107 }
```

(End definition for `\prepare@family@series@update` and `\@meta@family@list`.)

`\update@series@target@value` In this macro used in the look you basically find the nested `\ifx`s from the outline above. The only difference is that it is parameterized instead of being written out and only for one block of tests because the code is called repeatedly when looping over the meta family list. From the list we get each meta family name in turn.

```
108 \def\update@series@target@value#1{%
```

There is one additional test at the beginning, because the list contains all meta families and we need to ignore the case where current one from the list and target one are identical.

```

109 \def\reserved@a{#1}%
110 \ifx\target@meta@family@value\reserved@a % rm -> rm do nothing
111 \else
112 <+debug> \series@change@debug{Trying to match #1: \csname#1def@ult\endcsname
113 <+debug> \space = \f@family\space ?}%

```

We only “do” something if the current font family matches the current meta family.

```

114 \expandafter\ifx\csname#1def@ult\endcsname\f@family

```

If that’s the case we know that this is the block that applies (only one meta family can match). So to speed things up we change \@elt so that the rest of the loop gets gobbled.

```

115 \let\@elt\@gobble

```

Then we try to find the right new value for the series (as explained above). The two macros defined first are only there because we now need to use \csname and this way the code will be a little faster.

```

116 \expandafter\let\expandafter\reserved@b
117 \csname mdseries@\target@meta@family@value\endcsname
118 \expandafter\let\expandafter\reserved@c
119 \csname bfseries@\target@meta@family@value\endcsname
120 <+debug>\series@change@debug{Targets for mdseries and bfseries:
121 <+debug> \reserved@b\space and \reserved@c}%

```

This here is now identical to the nested \ifx block from the outline, except that it there appeared twice in \rmfamily. This is now covered by looping and stopping the loop when a match was found.

We have to sanitize the default value first because it may contain something like mc and that would never match \f@series because there it would be called c with the m dropped. It would be probably better to do that differently these days, but it is hard to adjust without causing a lot of issues, so we do the dropping in various places instead.

```

122 \expandafter\series@maybe@drop@one@m
123 \csname mdseries@#1\endcsname\reserved@d
124 \ifx\reserved@d\f@series
125 <+debug> \series@change@debug{mdseries@#1 matched -> \reserved@b}%
126 \let\target@series@value\reserved@b
127 \else

```

Again do some sanitizing.

```

128 \expandafter\series@maybe@drop@one@m
129 \csname bfseries@#1\endcsname\reserved@d
130 \ifx\reserved@d\f@series
131 <+debug> \series@change@debug{bfseries@#1 matched -> \reserved@c}%
132 \let\target@series@value\reserved@c
133 \else\ifx\f@series\mdddef@ult \let\target@series@value\reserved@b
134 <+debug> \series@change@debug{mdddef@ult matched -> \reserved@b}%
135 \else\ifx\f@series\bfdef@ult \let\target@series@value\reserved@c
136 <+debug> \series@change@debug{bfdef@ult matched -> \reserved@c}%
137 \fi\fi\fi\fi
138 \fi
139 \fi
140 }

```

(End definition for \update@series@target@value.)

`\init@series@setup` This is code to be run at begin document ...

```
141 \def\init@series@setup{%
```

We only want `bx` in `\bfseries@rm` if the roman font is Computer Modern or Latin Modern, otherwise it should be `b`. It was set to `bx` in the kernel so that any font use with the default families in the preamble get this value. Now at the real document start we check if the fonts have been changed. If there was a `\DeclareFontSeriesDefault` declaration or `\bfseries@rm` was directly altered then it differs from `\bfseries@rm@kernel` and we do nothing. Otherwise we check if `\rmdefault` is one of the CM/LM font families and if so we keep `bx` otherwise we change it to `b`.

This approach doesn't cover one case: CM/LM got changed to a different family that supports `bx`, but the support package for that family used `\def\bfseries@rm{bx}` instead of using `\DeclareFontSeriesDefault`. In that case the code here changes it to `b`. Solution: use the `\DeclareFontSeriesDefault` interface.

```
142 \ifx\bfseries@rm@kernel\bfseries@rm
143   \expandafter\in@\expandafter{\rmdefault}%
144   {cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmnt}%
145 \ifin@ \else \def\bfseries@rm{b}\fi\fi
```

Same approach for `\bfseries@sf` and `\bfseries@tt`:

```
146 \ifx\bfseries@sf@kernel\bfseries@sf
147   \expandafter\in@\expandafter{\sfdefault}%
148   {cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmnt}%
149 \ifin@ \else \def\bfseries@sf{b}\fi\fi
150 \ifx\bfseries@tt@kernel\bfseries@tt
151   \expandafter\in@\expandafter{\ttdefault}%
152   {cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmnt}%
153 \ifin@ \else \def\bfseries@tt{b}\fi\fi
```

If the document preamble has changed the `\familydefault` or if the if the `\rmdefault` contains a new font family, we may have to adjust the series defaults accordingly, before starting typesetting.

Similarly, if the user has changed the `\mddefault` or the medium series for the family selected as document font we may also have to adjust the `\seriesdefault`.

On the other hand if the document font is still CM or LM then `\bfdefault` is wrong, because it is now saying `b` and not `bx` as it should for such fonts.

To fix all this we first run `\reset@font` (the internal kernel name for `\normalfont`). This will set up the document encoding, family, series and shape based on the current values of `\encodingdefault`, `\familydefault`, `\seriesdefault` and `\shapedefault`. However, if the family (from `\familydefault`) has special medium default we should switch to that (and not use what is current value from `\seriesdefault`). This can be achieved by afterwards calling `\mediumseries` and then changing `\seriesdefault` to the now current series value (in `\f@series`).

But what should happen if `\seriesdefault` got explicitly changed? In that case the explicit change should survive and we should not alter `\seriesdefault`. This is solved by comparing the current value of `\seriesdefault` with a kernel version saved in the format and if they differ we do not call `\mdseries` or change `\seriesdefault`.

```
154 \reset@font
155 \ifx\seriesdefault\seriesdefault@kernel
156   \mdseries
157   \let\seriesdefault\f@series
158 \fi
159 }%
```

(End definition for `\init@series@setup`.)

As the kernel code now implements the same functionality as `mweights`, albeit internally coded slightly differently, that package shouldn't be loaded any more. We therefore pretend that it already got loaded. Thus, a font package that tries to load it and then sets `\mdseries@.`, etc. will continue to work but will now use the kernel code.

Of course, mid-term such package should probably use `\DeclareFontSeriesDefault` instead of making using low-level definitions.

```

160 \expandafter\let\csname ver@mweights.sty\endcsname\fmtversion

188 <latexrelease>\IncludeInRelease{2020/10/01}%
189 <latexrelease>          {\bfseries}{Custom series with hooks}%

```

`\expand@font@defaults` The family specific defaults are fully expanded, i.e., they are defined via `\edef` inside `\DeclareFontSeriesDefault`. However, the overall defaults, e.g., `\bfdefault` may have been redefined by the user and thus may not be fully expanded. So to enable reliable comparison we make expanded versions of them. That we rerun each time. The alternative would be to only allow for changes before begin document.

```

\rm@def@ult
\sfont@def@ult
\tt@def@ult
\md@def@ult
\bf@def@ult
190 \def\expand@font@defaults{%
191   \edef\rmdef@ult{\rmdefault}%
192   \edef\sfont@def@ult{\sfontdefault}%
193   \edef\ttdef@ult{\ttdefault}%

```

The series defaults may contain some surplus m that we need to drop here.

```

194   \series@maybe@drop@one@m\bfdefault\bfdef@ult
195   \series@maybe@drop@one@m\mddefault\mddef@ult

```

Formats that set up parallel fonts, e.g., for Japanese, can use this hook to add additional code here.

```
196 \UseHook{expand@font@defaults}%
197 }
```

(End definition for `\expand@font@defaults` and others.)

\bfseries This document command switches to the bold series.

```
198 \DeclareRobustCommand\bfseries{%
199 \not@math@alphabet\bfseries\mathbf
```

In the original NFSS definition it then called `\fontseries` with the value `\bfdefault`. In the new scheme we have more alternatives and therefore check if the current family (`\f@family`) is the current `\rmdef@ult`, `\sfdef@ult` or `\ttdef@ult` and then select the correct family default in that case.

```
200 \expand@font@defaults
```

If `\bfdefault` and `\bfdefault@previous` are different then the default got changed directly through the legacy interface (i.e., via `\def` or `\renewcommand`. In that case we reset all meta family defaults so that the document behaves like it was the case before the new mechanism was introduced.

```
201 \ifx\bfdefault\bfdefault@previous\else
```

We add `\@empty` and then let `\bfdefault@previous` to `\bfdefault` so that we can detect any further change.

```
202 \expandafter\def\expandafter\bfdefault
203 \expandafter{\bfdefault\@empty}%
204 \let\bfdefault@previous\bfdefault
```

And we reset the meta family defaults (`\bfdef@ult` is an expanded version of `\bfdefault`).

```
205 \let\bfseries@rm\bfdef@ult
206 \let\bfseries@sf\bfdef@ult
207 \let\bfseries@tt\bfdef@ult
```

Formats that set up parallel fonts, e.g., for Japanese, can use this hook to add resets here. Not that this hook is only run when resets are necessary.

```
208 \UseHook{bfseries/defaults}%
209 \fi
210 \ifx\f@family\rmdef@ult \fontseries\bfseries@rm
211 \else\ifx\f@family\sfdef@ult \fontseries\bfseries@sf
212 \else\ifx\f@family\ttdef@ult \fontseries\bfseries@tt
```

If not `\bfdefault` is used.

```
213 \else \fontseries\bfdefault
214 \fi\fi\fi
```

This hook in contrast is always executed.

```
215 \UseHook{bfseries}%
216 \selectfont
217 }
```

(End definition for `\bfseries`.)

`\mdseries` This document command switches to the medium series.

```
218 \DeclareRobustCommand\mdseries{%
219   \not@math@alphabet\mdseries\relax
220   \expand@font@defaults
221   \ifx\mddefault\mddefault@previous\else
222     \expandafter\def\expandafter\mddefault\expandafter{\mddefault\@empty}%
223     \let\mddefault@previous\mddefault
224     \let\mdseries@rm\mddef@ult
225     \let\mdseries@sf\mddef@ult
226     \let\mdseries@tt\mddef@ult
```

Formats that set up parallel fonts, e.g., for Japanese, can use this hook to add resets here.

```
227   \UseHook{mdseries/defaults}%
228   \fi
229   \ifx\f@family\rmdef@ult      \fontseries\mdseries@rm
230   \else\ifx\f@family\sfdef@ult \fontseries\mdseries@sf
231   \else\ifx\f@family\ttdef@ult \fontseries\mdseries@tt
232   \else                        \fontseries\mddefault
233   \fi\fi\fi
234   \UseHook{mdseries}%
235   \selectfont
236 }
```

(End definition for \mdseries.)

`\rmfamily` Here are the document level commands for changing the main font families, or rather, here is a documented outline of the code, the actual code is then streamlined and somewhat generalized.

```
DeclareRobustCommand\rmfamily{%
  \not@math@alphabet\rmfamily\mathrm
```

If families are changed then we have to do a bit more work. In the original NFSS implementation a family change kept encoding, series shape and size unchanged but now we can't any longer simply reuse the current series value. Instead we may have to change it from one family default to the next.

```
\expand@font@defaults
```

We have to do the testing while the current family is still unchanged but we have to do the adjustment of the series after it got changed (because the new family might have different sets of shapes available and we certainly don't want to see substitution going on. So we use `\target@series@value` to hold the target series (if any).

```
\let\target@series@value\@empty
```

Thus, if the current family is the sans family

```
\ifx\f@family\sfdef@ult
```

and if we using the medium series of the sans family

```
\ifx\f@series\mdseries@sf
```

then lets switch to the medium series for the serif family

```
\let\target@series@value\mdseries@rm
```

and if we use the bold series of the sans family switch to the bold default of the serif family:

```
\else\ifx\f@series\bfseries@sf \let\target@series@value\bfseries@rm
```

However, the sans family may not have any specific defaults set, so we also compare with the overall defaults.

```
\else\ifx\f@series\mddef@ult \let\target@series@value\mdseries@rm
\else\ifx\f@series\bfdef@ult \let\target@series@value\bfseries@rm
```

If neither test was true we leave the series alone. This way a special manual setting such as `\fontseries{lc}` is not undone if the family changes (of course there may not be any support for it in the new family but then the NFSS substitution kicks in and sorts it out).

```
\fi\fi\fi\fi
```

We need to do the same if the current family is the typewriter family:

```
\else\ifx\f@family\ttdef@ult
\ifx\f@series\mdseries@tt \let\target@series@value\mdseries@rm
\else\ifx\f@series\bfseries@tt \let\target@series@value\bfseries@rm
\else\ifx\f@series\mddef@ult \let\target@series@value\mdseries@rm
\else\ifx\f@series\bfdef@ult \let\target@series@value\bfseries@rm
\fi\fi\fi\fi
\fi\fi
```

With these preparations for series out of the way we can now change the font family to `\rmdefault`.

```
\fontfamily\rmdefault
```

If `\target@series@value` is still empty there is nothing more to do other than selecting the new family. However, if not then we should update the font series now as well. But there is one further subtle issue. We may not have loaded an `.fd` file for our target font family yet. In the past that was done in `\selectfont` if necessary but since we are now doing all the comparisons in `\fontseries` we need to make sure that the font family specifications are already loaded prior to calling `\fontseries`.

```
\ifx\target@series@value\@empty \else
\maybe@load@fontshape
```

Updating the series in this case means directly changing `\f@series` to the target value. We don't want to go through `\fontseries` because that would apply the mappings and then `bx + b` would keep `bx` instead of changing to `b` as desired. as

```
\let\f@series\target@series@value
\fi
\selectfont}
```

So now for the real definition: most of the code above gets delegated to a helper command `\prepare@family@series@update` so that the definition becomes again fairly short. In addition we add a hook, mainly for our Japanese friends so that the code can be extended prior to the call to `\selectfont`.

```
237 \DeclareRobustCommand\rmfamily{%
238   \not@math@alphabet\rmfamily\mathrm
```

This holds all the code discussed above, first argument is the meta family, i.e., `rm` in this case, and second argument is the default family name, e.g., `cmr` indirectly accessed via `\rmdefault`. This is calling `\fontfamily` and if necessary `\fontseries` as outline above.

```
239   \prepare@family@series@update{rm}\rmdefault
```

Then comes the hook code (by default a no-op) and finally the call to `\selectfont`.

```
240   \UseHook{rmfamily}%
241   \selectfont}
```

The definitions for `\sffamily` and `\ttfamily` are similar, the differences are only in what font families get checked.

```
\sffamily
\sffamily 242 \DeclareRobustCommand\sffamily{%
243   \not@math@alphabet\sffamily\mathsf
244   \prepare@family@series@update{sf}\sfdefault
245   \UseHook{sffamily}%
246   \selectfont}

247 \DeclareRobustCommand\ttfamily{%
248   \not@math@alphabet\ttfamily\mathtt
249   \prepare@family@series@update{tt}\ttdefault
250   \UseHook{ttfamily}%
251   \selectfont}
```

(End definition for \rmfamily, \sffamily, and \ttfamily.)

```
rmfamily  Declare the hooks used above.
sffamily  252 \NewHook{rmfamily}
ttfamily  253 \NewHook{sffamily}

```

`\IfFontSeriesContextTF` With the ability for `\bfseries` or `\mdseries` to be mapped to different NFSS axis values it becomes important to have the ability to determine the current context as we can no longer look at `\f@series` to answer a question such as “am I currently typesetting in a bold typeface?”

This is provided by the test `\IfFontSeriesContextTF`. It takes three arguments:

- The context we try to check (either `bf` for bold or `md` for medium, i.e., the same that can go into the first mandatory argument of `\DeclareFontSeriesDefault`),
- what to do if we are in this context (true case) and
- what to do if we are not (false case).

This allows you to define commands like `\IfBold`, e.g.,

```
\newcommand\IfBold[2]{\IfSeriesContextTF{bf}{#1}{#2}}
```

and then do

```
This is \IfBold{bold}{non-bold} text.
```

and get the appropriate result.

```

346 </2ekernel>
347 <*2ekernel | latexrelease>
348 <latexrelease>\IncludeInRelease{2020/10/01}%
349 <latexrelease>          {\IfFontSeriesContextTF}{Font series context}%

```

```

350 \DeclareRobustCommand\IfFontSeriesContextTF[1]{%
351   \expand@font@defaults

```

In the beginning we haven't found the context we are looking for.

```

352   \@font@series@contextfalse

```

We store the requested context away for use in the tests.

```

353   \def\requested@test@context{#1}%

```

The next definition is there to ensure that get a final match during testing even if the current family is non of the meta families (`rm`, `sf` or `tt`). This will then basically tests if the current font family matches the overall default.

```

354   \expandafter\edef\csname ??def@ult\endcsname{\f@family}%

```

Then we run through the meta family list (currently containing just the three values) followed by the artificial meta family `??` and test each of them in turn using `\test@font@series@context` as the testing command.

```

355   \let\@elt\test@font@series@context
356   \@meta@family@list
357   \@elt{??}%
358   \let\@elt\relax

```

Following that we evaluate the status of `\if@font@series@context` to determine which of the remaining arguments (true/false case) we have to execute.

```

359   \if@font@series@context
360   \expandafter\@firstoftwo
361   \else
362   \expandafter\@secondoftwo
363   \fi
364 }

```

(End definition for \IfFontSeriesContextTF.)

`\test@font@series@context` This tests the context (stored in `\requested@test@context`) and updates the boolean if the right context is found.

```

365 \def\test@font@series@context#1{%

```

First task is to figure out whether the current family matches `\rmfamily`, `\sffamily`, etc. so in `\reserved@a` we store the value of `\rmdef@ult` (or whatever the given meta family is) and compare that to `\f@family`.

```

366   \edef\reserved@a{\csname #1def@ult\endcsname}%
367   \ifx\f@family\reserved@a

```

If they match we have found the right meta family so we don't need to test any of the remaining meta family and therefore change `\@elt` to `\@gobble`.

```

368   \let\@elt\@gobble

```

Now we have to test if `\f@series` matches the requested context (e.g., whether `\bfseries@rm` has that value if the current meta family is `rm` and we are looking for the `bf` context).

```

369   \expandafter\ifx
370   \csname\requested@test@context series@#1\endcsname\f@series

```

If yes we change the boolean and are done.

```

371   \@font@series@contexttrue

```

If not then maybe the reason is that nothing special was set up for that meta family so we also check now check if `\f@series` matches the overall default (e.g., `\bfdef@ult` if we are looking for the bold context). If that matches we change the boolean.

```

372     \else
373         \expandafter\ifx
374             \csname\requested@test@context def@ult\endcsname\f@series
375             \@font@series@contexttrue
376     \fi\fi\fi
377 }

```

(End definition for `\test@font@series@context`.)

`\if@font@series@context` The boolean to signal if we found the requested font series context.

```

378 \newif\if@font@series@context

```

(End definition for `\if@font@series@context`.)

```

379 </2ekernel | latexrelease>

```

3 Supporting nested emphasis

By default $\text{\LaTeX}_{2\epsilon}$ supports two levels of nested emphasis: if the current font has an upright shape then it switches to `\itshape` otherwise to `\emminnershape` (which defaults to `\upshape`). This means nested emphasis will oscillate between italic and upright shapes.

Sometimes it would be nice to allow for a more lengthy sequence, but instead of providing a fixed one \LaTeX now offers a general mechanism that allows to define arbitrary sequences.

`\DeclareEmphSequence`
`\emforce`

This declaration expects a comma separated list of (font) change declarations corresponding to increasing levels of emphasis. The mechanism tries to be “smart” and verifies that the declarations actually alter the font. If not it will ignore this level and tries the next one—the assumption being that there was a manual font change in the document to the font that is now supposed to be used for emphasis. Of course, this only works if the declarations in the list actually change the font and not, say, just the color. In such a case one has to use `\emforce` to which directs the mechanism to use the level even if the font attributes haven’t changed.

`\emreset` If the nesting is so deep, that the specified levels are exhausted then `\emreset` is used as a final set of declarations (which by default returns back to the upright shape). Any additional nesting levels will then reuse the list from its beginning.

`\DeclareEmphSequence` `\DeclareEmphSequence` expects a clist of declaration. Spaces in the argument are dropped to avoid spurious spaces in the output. The declarations are additive. At the very end the shape is reset using `\emreset` and `\emforce` so that this case is never skipped.¹⁶ Further nested calls restart at the beginning.

```

391 </2ekernel>
392 <*2ekernel|latexrelease>
393 <latexrelease>\IncludeInRelease{2020/02/02}%
394 <latexrelease>{\DeclareEmphSequence}{Nested emph}%
395 \def\DeclareEmphSequence#1{%
396   \protected@edef\emfontdeclare@clist{\zap@space#1, \@empty\emforce\emreset}%
397 }

```

By default the it is empty, in which case `\emminnershape` is used by L^AT_EX.

```

398 \let\emfontdeclare@clist\@empty

```

(End definition for \DeclareEmphSequence.)

`\emrest` Reset the font to upright and upper/lower case. With the default rules using `\shapedefault` does that for us but to be on the safe side we do it like this:

```

399 \DeclareRobustCommand\emreset{\upshape\ulcshape}

```

(End definition for \emrest.)

`\em` The new definition for `\em` (and implicitly `\emph`) is the same as before as long as `\emfontdeclare@clist` is empty.

```

400 \DeclareRobustCommand\em{%
401   \@nomath\em
402   \ifx\emfontdeclare@clist\@empty
403     \ifdim \fontdimen\@ne\font >\z@
404       \emminnershape \else \itshape \fi
405   \else

```

But if not we use the list to decide how to do emphasis.

We use the current font to check if the declarations have any effect, so even a size change is allowed and identified as a modification (but a color change, for example, isn't). So first we save the current status.

```

406   \edef\em@currfont{\csname\curr@fontshape/\f@size\endcsname}%

```

Then we grab the next element from the list and check if it can be used.

```

407   \expandafter\do@emfont@update\emfontdeclare@clist\do@emfont@update
408   \fi
409 }
410 \def\emminnershape{\upshape}

```

(End definition for \em.)

`\do@emfont@update` We know that the list (if not empty) has at least 2 elements separated by a comma, so we pick up the first in #1 and the rest in #2.

```

411 \def\do@emfont@update#1,#2\do@emfont@update{%

```

First action is to alter the list and move the first entry to the end

```

412   \def\emfontdeclare@clist{#2,#1}%

```

¹⁶Maybe we should not add `\emforce` but allow that case to be skipped as well. Of course, that might result in an endless loop if somebody defines a sequence without any font change and without `\emforce` but ...

Then we execute current declaration. Appending `\selectfont` means one can write just `\fontshape{it}}` and that works then too.

```
413 % \typeout{Use: \detokenize{#1}}%
414 #1\selectfont
```

We then compare the current font with our saved version, but with a slight twist: we add `\em@force` at the end of the name. Normally this is empty so has no effect but if there was an `\emforce` as part of `#1` it will append a `/` to the font name (making it invalid) thus this will then always fail the test.

If the test fails we are done and the declarations will be used. Otherwise we will try the next declaration in the sequence.

```
415 \expandafter\ifx\csname \curr@fontshape/\f@size\em@force
```

For the comparison with `\ifx` we have to expand `\em@currfont` once as the relevant info is inside.

```
416 \expandafter\endcsname
417 \em@currfont
418 \expandafter\do@emfont@update\emfontdeclare@clist\do@emfont@update
```

If `\emforce` was used, we have to undo its effect:

```
419 \else
420 \let\em@force\@empty
421 \fi
422 }
```

(End definition for \do@emfont@update.)

`\emforce` The definition of `\emforce` is simple: change `\em@force` to make the above test always
`\em@force` invalid.

```
423 \protected\def\emforce{\def\em@force{}}
424 \let\em@force\@empty
425 </2ekernel | latexrelease>
426 <latexrelease>\EndIncludeInRelease
```

(End definition for \emforce and \em@force.)

`\em` These are the older definitions for `\em`, prior to 2020.

`\emminnershape` We also have to define the *emphasize* font change command (i.e. `\em`). This command will look is the current font is sloped (i.e. has a positive `\fontdimen1`) and will then select either `\upshape` or `\itshape`.

```
427 <latexrelease>\IncludeInRelease{2015/01/01}{\DeclareEmphSequence}{Nested emph}%

444 <latexrelease>\let\eminnershape\@undefined
445 <latexrelease>\EndIncludeInRelease
446 <*2ekernel>

```

(End definition for \em and \eminnershape.)

\not@math@alphabet This function generates an error message when it is called in math mode. The same function should be defined in `newfont.sty`.

```

447 \def\not@math@alphabet#1#2{%
448   \relax
449   \ifmmode
450     \@latex@error{Command \noexpand#1invalid in math mode}%
451     {%
452       Please
453       \ifx#2\relax
454         define a new math alphabet^^J%
455         if you want to use a special font in math mode%
456       \else

```

We have to a \noexpand below to prevent expansion of #2. In case of #1 we can omit this (due to the current definition of robust commands since they do come out right there :-).

```

457         use the math alphabet \noexpand#2instead of
458         the #1command%
459       \fi
460     .
461   }%
462 \fi}

```

(End definition for \not@math@alphabet.)

Finally we provide two abbreviations to switch to the L^AT_EX versions.

```

463 \DeclareRobustCommand\boldmath{\@nomath\boldmath
464       \mathversion{bold}}
465 \DeclareRobustCommand\unboldmath{\@nomath\unboldmath
466       \mathversion{normal}}

```

Here we switch to the default math version by defining the internal macro \math@version. We dare not to call \mathversion at this place because this would call \gls@settings.

```

467 \def\math@version{normal}

```

3.1 Legacy

We start by defining a few macros that are part of standard L^AT_EX's user interface. The use of these functions is not encouraged, but they will allow to process older documents without changes to the source.

\newfont

```

468 \def\newfont#1#2{\@ifdefinable#1{\font#1=#2\relax}}

```

(End definition for \newfont.)

`\symbol`

```
469 </2ekernel>
470 <*2ekernel | latexrelease>
471 <latexrelease>\IncludeInRelease{2020/10/01}%
472 <latexrelease>{\symbol}{XeTeX change for math}%
473 \ifdefined\XeTeXversion
474 \DeclareRobustCommand\symbol[1]{\Ucharcat#1 12\relax}
475 \else
476 \DeclareRobustCommand\symbol[1]{\char#1\relax}
477 \fi
478 </2ekernel | latexrelease>
479 <latexrelease>\EndIncludeInRelease
480 <latexrelease>\IncludeInRelease{0000/00/00}%
481 <latexrelease>{\symbol}{XeTeX change for math}%
482 <latexrelease>
483 <latexrelease>\DeclareRobustCommand\symbol[1]{\char#1\relax}
484 <latexrelease>
485 <latexrelease>\EndIncludeInRelease
486 <*2ekernel>
```

(End definition for \symbol.)

3.2 Miscellaneous

`\@setfontsize` This abbreviation is used by L^AT_EX's user level size changing commands, such as `\large`.

`\@setsize` 487 `\def\@setfontsize#1#2#3{\@nomath#1%`

For the benefit of people relying on keeping the name of the current font command saved in `\@currsize` we define it. To ensure that `\@setfontsize` keeps being robust we omit this assignment during times where `\protect` differs from `\@typeset@protect`.

```
488 \ifx\protect\@typeset@protect
489 \let\@currsize#1%
490 \fi
491 \fontsize{#2}{#3}\selectfont}
```

For compatibility we also define `\@setsize` the 209 command

```
492 <*compat>
493 \def\@setsize#1#2#3#4{\@setfontsize#1{#4}{#2}}
494 </compat>
```

(End definition for \@setfontsize and \@setsize.)

`\hexnumber@` To set up L^AT_EX's special math character definitions we first provide a macro to generate hexadecimal numbers. It is a rather simple `\ifcase`.

```
495 \def\hexnumber@#1{\ifcase\number#1
496 0\or 1\or 2\or 3\or 4\or 5\or 6\or 7\or 8\or
497 9\or A\or B\or C\or D\or E\or F\fi}
```

(End definition for \hexnumber@.)

`\nfss@text` In its simplest form `\nfss@text` is an `\mbox`. This will produce unbreakable text outside math and inside math you will get text with the same fonts as outside. The only drawback is that such item won't change sizes in subscripts. But this behavior can be easily changed.

With the `amstex` style option one will get a sub style called `amstext` which will redefine the `\nfss@text` macro to produce correct text in all sizes.

We have to use `\def` instead of the shorter `\let` since `\mbox` is undefined when we reach this point.

```
498 \def\nfss@text#1{\mbox{#1}}
```

(End definition for `\nfss@text`.)

\copyright The definition of `\copyright` was changed so that it works in other type styles, and to make it robust. We leave the family untouched so that the copyright notice will come out differently if a different font family is in use. This command is commented out, since it is now defined in `ltoutenc.dtx`.

```
499 %\DeclareRobustCommand\copyright
500 %    {\oalign{\hfil
501 %        \raise.07ex\hbox{\mdseries\upshape c}\hfil\crcr
502 %        \mathhexbox20D}}}
```

(End definition for `\copyright`.)

\normalfont The macro `\reset@font` is used in L^AT_EX to switch to a standard font, in order to initialize the current font in situations where typesetting is done in a new visual context (e.g. in a footnote). We define it here to allow the test for the new L^AT_EX version above but nevertheless are able to run all kind of mixtures.

The user interface name for `\reset@font` is `\normalfont`:

```
503 </2ekernel>
504 <*2ekernel | latexrelease>
505 <latexrelease>\IncludeInRelease{2020/02/02}%
506 <latexrelease>                {\normalfont}{Add hook to \normalfont}%
507 \DeclareRobustCommand\normalfont%
```

Instead of calling `\usefont`, as it was done in the past, we inline the code from `\usefont` as we want to add the hook before `\selectfont`, but after all the font attributes are set.

```
508 \fontencoding\encodingdefault
509 \edef\f@family{\familydefault}%
510 \edef\f@series{\seriesdefault}%
511 \edef\f@shape{\shapedefault}%

512 \UseHook{normalfont}%
```

This is the old name for the hook introduced in 2020/02/02. It will be removed in one of the future releases!

```
513 \@defaultfamilyhook          % hookname from 2020/02 will vanish
514 \selectfont}

515 \let\reset@font\normalfont
```

(End definition for `\normalfont` and `\reset@font`.)

```
516 </2ekernel | latexrelease>
517 <latexrelease>\EndIncludeInRelease
518 <latexrelease>\IncludeInRelease{0000/00/00}%
519 <latexrelease>                {\normalfont}{Add hook to \normalfont}%
520 <latexrelease>
521 <latexrelease>\DeclareRobustCommand\normalfont
522 <latexrelease>                {\usefont\encodingdefault
523 <latexrelease>                \familydefault
```

```

524 <latexrelease>                \seriesdefault
525 <latexrelease>                \shapedefault
526 <latexrelease>                \relax}
527 <latexrelease>\let\reset@font\normalfont
528 <latexrelease>
529 <latexrelease>\let\@defaultfamilyhook\@undefined
530 <latexrelease>
531 <latexrelease>\EndIncludeInRelease
532 <*2ekernel>

```

We left out the special L^AT_EX fonts which are not automatically included in the base version of the font selection since these fonts contain only a few characters which are also included in the AMS fonts so anybody who is using these fonts doesn't need them. But for compatibility reasons we will define these symbols.

```

533 \def\not@base#1{\@latex@error
534   {Command \noexpand#1not provided in base LaTeX2e}%
535   {Load the latexsym or the amsfonts package to
536    define this symbol}}
537 \def\mho{\not@base\mho}
538 \def\Join{\not@base\Join}
539 \def\Box{\not@base\Box}
540 \def\Diamond{\not@base\Diamond}
541 \def\leadsto{\not@base\leadsto}
542 \def\squsubset{\not@base\squsubset}
543 \def\squsupset{\not@base\squsupset}
544 \def\lhd{\not@base\lhd}
545 \def\unlhd{\not@base\unlhd}
546 \def\rhd{\not@base\rhd}
547 \def\unrhd{\not@base\unrhd}

```

We now initialize all variables set by `\DeclareErrorFont`. These values are not really important since they will be overwritten later on by the definition in `fontdef.ltx`.

However, if `fontdef.cfg` is corrupted then at least a hopefully suitable error font is present.

```

548 \DeclareErrorFont{OT1}{cmr}{m}{n}{10}  %% don't modify this setting
549                                         %% overwrite it in fontdef.cfg
550                                         %% if necessary

```

We also set some default values for `\f@family` etc. Note that we don't yet have any encodings that comes later. In the past this was implicitly done by `\DeclareErrorFont`.

```

551 \fontfamily{cmr}

```

Previously the default values for series and shape were set by calling `\fontseries` and `\fontshape`, but their action is now delayed until `\selectfont` which isn't called inside the format (to avoid unnecessarily loading a font that may never get used). We therefore have to set `\f@series` and `\f@shape` directly instead.

```

552 \def\f@series{m}                % \fontseries{m}
553 \def\f@shape{n}                % \fontshape{n}
554 \fontsize{10}{10}

```

The initial `fontenc` package load list. This will get overwritten in `fonttext` and is only provided in case an old `fonttext.cfg` does not define the command:

```

555 \def\@fontenc@load@list{\@elt{T1,OT1}}

```

We now load the customizable parts of NFSS.

```

556 \InputIfFileExists{fonttext.cfg}
557     {\typeout{=====^^J%
558             ^^J%
559             Local config file fonttext.cfg used^^J%
560             ^^J%
561             =====}%
562     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
563     }
564     {\input{fonttext.ltx}}
565 \let\@addtofilelist\@gobble

```

Ditto for math although I don't think that we will get a lot of customisation :-)

```

566 \InputIfFileExists{fontmath.cfg}
567     {\typeout{=====^^J%
568             ^^J%
569             Local config file fontmath.cfg used^^J%
570             ^^J%
571             =====}%
572     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
573     }
574     {\input{fontmath.ltx}}
575 \let\@addtofilelist\@gobble

```

Then we preload several fonts. This file might be customized *without* changing the behavior of the format (i.e. necessary font definitions will be loaded at runtime if they are not preloaded). This is done in the file `preload.ltx`.

```

576 \InputIfFileExists{preload.cfg}
577     {\typeout{=====^^J%
578             ^^J%
579             Local config file preload.cfg used^^J%
580             ^^J%
581             =====}%
582     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
583     }
584     {\input{preload.ltx}}
585 \let\@addtofilelist\@gobble

```

`\seriesdefault` After `\seriesdefault` got defined inside `fonttext.ltx` or a `.cfg` file overwriting it, we alter its value by appending `\@empty` to it. This will vanish if expanded but allows us to check if the default gets altered (even to the same value) in the document preamble. All we have to do is to save the current value somewhere and later compare the two. For this we use `\seriesdefault@kernel`.

```

586 \expandafter\def\expandafter\seriesdefault\expandafter{\seriesdefault\@empty}
587 \let\seriesdefault@kernel\seriesdefault

```

(End definition for `\seriesdefault` and `\seriesdefault@kernel`.)

`\@acci` We also save the values of some accents in `\@acci`, `\@accii` and `\@acciii` so they can be restored by a `minipage` inside a `tabbing` environment.

```

588 \let\@acci\' \let\@accii\' \let\@acciii\=

```

(End definition for `\@acci`, `\@accii`, and `\@acciii`.)

`\cal` Here were the two old *alphabet identifiers*.

`\mit`

(End definition for \cal and \mit.)

599 </2ekernel>

File y

fontdef.dtx

<-latexrelease> [2021/01/15 v3.0i LaTeX Kernel (<-latexrelease> font setup)]

1 Introduction

This file is used to generate the files `fonttext.ltx` (text font declarations) and `fontmath.ltx` (math font declarations), which are used during the format generation. It contains the declaration of the standard text encodings used at the site as well as a minimal subset of font shape groups that NFSS will look at to ensure that the specified encodings are valid.

The math part contains the setup for math encodings as well as the default math symbol declarations that belong to the encoding.

It is possible to change this setup (by using other fonts, or defaults) without losing the ability to process documents written at other sites. Portability in this sense means that a document will compile without errors. It does not mean, however, that identical output will be produced. For this it is necessary that the distributed setup is used at both installations.

2 Customization

You are not allowed to change this source file! If you want to change the default encodings and/or the font shape groups preloaded you should create a copy of `fonttext.ltx` under the name `fonttext.cfg` and change this copy. If $\text{\LaTeX} 2_{\epsilon}$ finds a file of this name it will use it, otherwise it uses the standard file which is `fontdef.ltx`.

If you don't plan to use Computer Modern much or at all, it might (!) be a good idea to make your own `fonttext.cfg`. Look at the comments below (docstrip module 'text') to see what should go into such a file.

To change the math font setup use a copy of `fontmath.ltx` under the name `fontmath.cfg` and change this copy. However, dealing with this interface is even more a job for an expert than changing the text font setup — in short, we don't encourage either.

Warning: please note that we don't support customised \LaTeX versions. Thus, before sending in a bug report please try your test file with a \LaTeX format which is not customised and send in the log from that version (unless the problem goes away).

Please note: the following standard encodings have to be defined in all local variants of `font....cfg` to guarantee that all \LaTeX installations behave in the same way.

T1	Cork \TeX text encoding
OT1	old \TeX text encoding
U	unknown encoding
OML	old \TeX math letters encoding
OMS	old \TeX math symbols encoding
OMX	old \TeX math extension symbols encoding
TU	Unicode

Notice that some of these encodings are ‘old’ in the sense that we hope that they will be superseded soon by encoding standards defined by the T_EX user community. Therefore this set of default encodings may change in the future.

The first candidate is OT1 which will soon be replaced by T1, the official T_EX text encoding.

Warning: If you add additional encodings to this file there is no guarantee any longer that files processable at your installation will also be processable at other installations. Thus, if you make use of such an encoding in your document, e.g. if you intend to typeset in Cyrillic (OT2 encoding), you need to specify this encoding in the preamble of your document prior to sending it to another installation. Once the encoding is specified in that place in your document, the document is processable at all L^AT_EX installations (provided they have suitable fonts installed).

For this reason we suggest that you define a short package file that sets up an additional encoding used at your site (rather than putting the encoding into this file) since this package can easily be shipped with your document.

3 The docstrip modules

The following modules are used to direct **docstrip** in generating external files:

driver	produce a documentation driver file
text	produce the file fonttext.ltx
math	produce the file fontmath.ltx
cfgtext	produce a dummy fonttext.cfg file
cfgmath	produce a dummy fontmath.cfg file

A typical **docstrip** command file would then have entries like:

```
generateFile{fonttext.ltx}{t}{\from{fontdef.dtx}{text}}
```

4 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e. the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 <*driver>
2 \documentclass{ltxdoc}
3 \GetFileInfo{fontdef.dtx}
4 \begin{document}
5   \DocInput{fontdef.dtx}
6 \end{document}
7 </driver>
```

5 The fonttext.ltx file

The identification is done earlier on with a \ProvidesFile declaration.

```
8 <*text>
9 \typeout{=== Don't modify this file, use a .cfg file instead ===^~J}
```

5.1 Encodings

This file declares the standard encodings for text and math fonts. All others should be declared in packages or in the documents directly.

For every text encoding there are normally a number of encoding specific commands, e.g. accents, special characters, etc. (The definition for such a command might have to change when the encoding is changed, because the character is in a different position, or not available at all, or the accent is produced in a different way.) This is handled by a general mechanism which is described in `ltoutenc.dtx`.

By convention, text encoding specific declarations, including the `\DeclareFontEncoding` declaration, are kept in separate file of the form `<enc>enc.def`, e.g. `ot1enc.def`. This allows other applications to make use of the declarations as well.

Similar to the default encoding, the loading of the encoding files for the two major text encodings shouldn't be changed. In particular, the `inputenc` package depends on this.

```
10 \input {omlenc.def}
11 \input {omsenc.def}
```

Documents containing a lot of accented characters should really be using T1 fonts. We therefore load this last so that T1 encoding specific commands are executed as fast as possible (encoding files are no longer reloaded in `fontenc`).

```
12 \input {ot1enc.def}
13 \input {t1enc.def}
14 \input{ts1enc.def}

15 \ifx\Umathcode\@undefined
```

We then set the default text font encoding. This will hopefully change some day to T1. This setting should *not* be changed to produce a portable format.

```
16 \fontencoding{OT1}

The initial fontenc package load list if an 8-bit TEX engine is used:
17 \def\@fontenc@load@list{\@elt{T1,OT1}}
18 \def\rmsubstdefault{cmr}
19 \def\sfsubstdefault{cmss}
20 \def\ttsubstdefault{cmtt}
21 \LoadFontDefinitionFile{TS1}{cmr}

22 \else
```

Unicode.

```
23 \input {tuenc.def}
24 \fontencoding{TU}

The initial fontenc package load list if a Unicode engine is used:
25 \def\@fontenc@load@list{\@elt{TU}}
26 \DeclareFontSubstitution{TU}{lmr}{m}{n}
27 \LoadFontDefinitionFile{TU}{lmr}
28 \LoadFontDefinitionFile{TU}{lmss}
29 \LoadFontDefinitionFile{TU}{lmtt}

30 \def\rmsubstdefault{lmr}
31 \def\sfsubstdefault{lmss}
32 \def\ttsubstdefault{lmtt}
33 \LoadFontDefinitionFile{TS1}{lmr}
```

```
34 \DeclareFontSubstitution{TU}{lmr}{m}{n}
```

End of Unicode branch.

```
35 \fi
```

If different encodings for text fonts are in use one could put the common setup into `\DeclareFontEncodingDefaults`. There is now a better mechanism so using this interface is discouraged!

```
36 \DeclareFontEncodingDefaults{}{}
```

Then we define the default substitution for every encoding. This release of $\text{\LaTeX 2}_{\epsilon}$ assumes that the ec fonts are available. It is possible to change this to point to some other font family (e.g., Times with the appropriate encoding if it is available) without making documents non-portable. However, in such a case documents will produce different page breaks at other sites. The substitution defaults can all be changed without losing portability as long as there are font shape definitions for the selected substitutions.

```
37 \DeclareFontSubstitution{T1}{cmr}{m}{n}
```

```
38 \DeclareFontSubstitution{OT1}{cmr}{m}{n}
```

For every encoding declaration, $\text{\LaTeX 2}_{\epsilon}$ will try to verify that the given substitution information makes sense, i.e. that it is impossible to go into an endless loop if font substitution happens. This is done at the moment the `\begin{document}` is encountered. $\text{\LaTeX 2}_{\epsilon}$ will then check that for every encoding the substitution defaults form a valid font shape group, which means that it will check if there is a `\DeclareFontShape` declaration for this combination. We will therefore load the corresponding `.fd` files now. If we don't do this they would be loaded at verification time (i.e. at `\begin{document}`) which would delay processing unnecessarily.

Warning: Please note that this means that you have to regenerate the format whenever you change any of these `.fd` files since $\text{\LaTeX 2}_{\epsilon}$ will not read `.fd` files if it already knows about the encoding/family combination.

The `\nfss@catcodes` ensures that white space is ignored in any definitions made in the fd files.

```
39 \begingroup
```

```
40 \nfss@catcodes
```

```
41 \input {t1cmr.fd}
```

```
42 \input {ot1cmr.fd}
```

```
43 \endgroup
```

We also load some other font definition files which are normally needed in a document. This is only done for processing speed and you can comment the next two lines out to save some memory. If necessary these files are then loaded when your document is processed. (Loading `.fd` files is a less drastic step compared to preloading fonts because the number of fonts is limited 255 at (nearly) every \TeX installation, while the amount of main memory is not a limiting factor at most installations.)

```
44 \begingroup
```

```
45 \nfss@catcodes
```

```
46 \input {ot1cmss.fd}
```

```
47 \input {ot1cmtt.fd}
```

```
48 \endgroup
```

Even with all the precautions it is still possible that NFSS will run into problems, for example, when a .fd file contains corrupted data. To guard against such cases NFSS has a very low-level fallback font that is installed with the following line.

```
49 \DeclareErrorFont{OT1}{cmr}{m}{n}{10}
```

This means, “if everything else fails use Computer Modern Roman normal shape at 10pt in the old text encoding”. You can change the font used but the encoding should be the same as the one specified with `\fontencoding` above.

5.2 Defaults

To allow the use of `\rmfamily`, `\sffamily`, etc. in documents even if non-standard families are used we provide nine macros which hold the name of the corresponding families, series, and so on. This makes it easy to use other font families (like Times Roman, etc.). One simply has to redefine these defaults.

All these hooks have to be defined in this file but you can change their meaning (except for `\encodingdefault`) without making documents non-portable.

```
\encodingdefault The following three definitions set up the meaning for \rmfamily, \sffamily, and
\rmdefault      \ttfamily.
\sfdefault
\ttdefault
50 \ifx\Umathcode\@undefined
51 \newcommand\encodingdefault{OT1}
52 \newcommand\rmdefault{cmr}
53 \newcommand\sfdefault{cmss}
54 \newcommand\ttdefault{cmtt}
55 \else
56 \newcommand\encodingdefault{TU}
57 \newcommand\rmdefault{lmr}
58 \fontfamily{\rmdefault}
59 \newcommand\sfdefault{lmss}
60 \newcommand\ttdefault{lmtt}
61 \fi
62 </text>

          93 \newcommand\mddefault{m} % overwritten below (for rollback)

```

(End definition for \bfdefault and \mddefault.)

```

\itdefault Shape changing commands use the following hooks.
\sldefault 94 \newcommand\itdefault{it}
\scdefault 95 \newcommand\sldefault{sl}
\updefault 96 \newcommand\scdefault{sc}
          97 \newcommand\updefault{up} % overwritten below (for rollback)

```

(End definition for \itdefault and others.)

```

98 </text>
99 <*text | latexrelease>
100 <latexrelease>\IncludeInRelease{2020/02/02}%
101 <latexrelease>          {\updefault}{font defaults change}%
102 % \begin{macrocode}
103 \renewcommand\updefault{up}

```

We append \@empty to the series value so that we can detect if it got changed via \def or \renewcommand later.

```

104 \renewcommand\bfdefault{b\@empty}
105 \renewcommand\mddefault{m\@empty}

106 \let\bfdefault@previous\bfdefault
107 \let\mddefault@previous\mddefault
108 </text | latexrelease>
109 <latexrelease>\EndIncludeInRelease
110 <latexrelease>\IncludeInRelease{0000/00/00}%
111 <latexrelease>          {\updefault}{font defaults change}%
112 <latexrelease>
113 <latexrelease>\renewcommand\updefault{n}
114 <latexrelease>\renewcommand\bfdefault{bx}
115 <latexrelease>
116 <latexrelease>\let\bfdefault@previous\undefined
117 <latexrelease>\let\mddefault@previous\undefined
118 <latexrelease>\EndIncludeInRelease
119 <*text>

```

`\familydefault` Finally we have the hooks that describe the behaviour of the `\normalfont` command.
`\seriesdefault` To stay portable, the definition of `\encodingdefault` should *not* be changed and should
`\shapedefault` match the setting above for `\fontencoding`. All other values can be set according to your taste.

```
120 \newcommand\familydefault{\rmdefault}
121 \newcommand\seriesdefault{\mddefault}
```

In previous releases `\shapedefault` pointed to `\updefault` which resolved to `n`, but these days that is no longer the case (and `up` is wrong when you want to do a reset. So we now use `n` explicitly.

```
122 \newcommand\shapedefault{n}
```

(End definition for `\familydefault`, `\seriesdefault`, and `\shapedefault`.)

This finishes the low-level setup in `fonttext.ltx`.

```
123 </text>
```

6 The fontmath.ltx file

The identification is done earlier on with a `\ProvidesFile` declaration.

```
124 <*math>
125 \typeout{=== Don't modify this file, use a .cfg file instead ===^~J}
```

6.1 The font encodings used

```
126 \DeclareFontEncoding{OML}{-}{-}
127 \DeclareFontEncoding{OMS}{-}{-}
128 \DeclareFontEncoding{OMX}{-}{-}
```

Finally a declaration for U encoding which serves for all fonts that do not fit standard encodings. For math this sets up `\noaccents@` providing for AMS- \LaTeX . This macro is used therein to handle accented characters if they are not supported by the font. In other words, if fonts with U encoding are used in math, all accents (like from `\breve`) are obtained from some other font that has them.

```
129 \DeclareFontEncoding{U}{-}{\noaccents@}
```

The encodings for math are next:

```
130 \DeclareFontSubstitution{OML}{cmm}{m}{it}
131 \DeclareFontSubstitution{OMS}{cmsy}{m}{n}
132 \DeclareFontSubstitution{OMX}{cmex}{m}{n}
133 \DeclareFontSubstitution{U}{cmr}{m}{n}
134 \begingroup
135 \nfss@catcodes
136 \input {omlcmm.fd}
137 \input {omscmsy.fd}
138 \input {omxcmex.fd}
139 \input {ucmr.fd}
140 \endgroup
```

6.1.1 Symbolfont and Alphabet declarations

We now define the basic symbol fonts used by \LaTeX . These four symbol fonts must be defined by this file.

It is possible to make the symbol fonts point to other external fonts without losing the ability to process documents written at other sites, as long as one defines the same

symbol font names with the same encodings, e.g. `operators` with OT1 etc. If other encodings are used documents become non-portable. Such a change should therefore be done in a package file.

```

141 \DeclareSymbolFont{operators}    {OT1}{cmr}{m}{n}
142 \DeclareSymbolFont{letters}     {OML}{cmm}{m}{it}
143 \DeclareSymbolFont{symbols}     {OMS}{cmsy}{m}{n}
144 \DeclareSymbolFont{largesymbols}{OMX}{cmex}{m}{n}

145 \SetSymbolFont{operators}{bold}{OT1}{cmr}{bx}{n}
146 \SetSymbolFont{letters}{bold}{OML}{cmm}{b}{it}
147 \SetSymbolFont{symbols}{bold}{OMS}{cmsy}{b}{n}

```

Below are the seven math alphabets which are defined by NFSS. Again they must be defined by this file. However, as before you can change the fonts used without losing portability, but you should be careful when changing the encoding since that may make documents come out wrong.

```

148 \DeclareSymbolFontAlphabet{\mathrm}    {operators}
149 \DeclareSymbolFontAlphabet{\mathnormal}{letters}
150 \DeclareSymbolFontAlphabet{\mathcal}   {symbols}
151 \DeclareMathAlphabet{\mathbf}         {\mathbf}{OT1}{cmr}{bx}{n}
152 \DeclareMathAlphabet{\mathsf}         {\mathsf}{OT1}{cmss}{m}{n}
153 \DeclareMathAlphabet{\mathit}         {\mathit}{OT1}{cmr}{m}{it}
154 \DeclareMathAlphabet{\mathtt}         {\mathtt}{OT1}{cmtt}{m}{n}

```

Given the currently available fonts we cannot bold-en `\mathbf` and `\mathtt` but in principle one could use ‘ultra bold’ or something. The alphabets defined via `\DeclareSymbolFontAlphabet` will change automatically in a new math version if the corresponding symbol font changes.

```

155 \SetMathAlphabet\mathsf{bold}{OT1}{cmss}{bx}{n}
156 \SetMathAlphabet\mathit{bold}{OT1}{cmr}{bx}{it}

```

6.2 Math font sizes

The declarations below declare the text, script and scriptscript size to be used for each text font size.

All occurrences of sizes longer than a single character are replaced with the macro name that holds them, saving a number of tokens (but losing a bit of speed, so this may not stay this way).

```

157 \DeclareMathSizes{5}{5}{5}{5}
158 \DeclareMathSizes{6}{6}{5}{5}
159 \DeclareMathSizes{7}{7}{5}{5}
160 \DeclareMathSizes{8}{8}{6}{5}
161 \DeclareMathSizes{9}{9}{6}{5}
162 \DeclareMathSizes{\@xpt}{\@xpt}{7}{5}
163 \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}
164 \DeclareMathSizes{\@xiipt}{\@xiipt}{8}{6}
165 \DeclareMathSizes{\@xivpt}{\@xivpt}{\@xpt}{7}
166 \DeclareMathSizes{\@xvipt}{\@xvipt}{\@xipt}{\@xpt}
167 \DeclareMathSizes{\@xxpt}{\@xxpt}{\@xivpt}{\@xiipt}
168 \DeclareMathSizes{\@xxvpt}{\@xxvpt}{\@xxpt}{\@xvipt}

```

6.3 The math symbol assignments

We start by setting up math codes for most of the characters typed in directly from the keyboard. Most of them are normally already setup up in the same way by `IniTEX`. However, we repeat them here to have a complete setup which can be exchanged with another if desired.

6.3.1 The letters

```
169 \DeclareMathSymbol{a}{\mathalpha}{letters}{‘a}
170 \DeclareMathSymbol{b}{\mathalpha}{letters}{‘b}
171 \DeclareMathSymbol{c}{\mathalpha}{letters}{‘c}
172 \DeclareMathSymbol{d}{\mathalpha}{letters}{‘d}
173 \DeclareMathSymbol{e}{\mathalpha}{letters}{‘e}
174 \DeclareMathSymbol{f}{\mathalpha}{letters}{‘f}
175 \DeclareMathSymbol{g}{\mathalpha}{letters}{‘g}
176 \DeclareMathSymbol{h}{\mathalpha}{letters}{‘h}
177 \DeclareMathSymbol{i}{\mathalpha}{letters}{‘i}
178 \DeclareMathSymbol{j}{\mathalpha}{letters}{‘j}
179 \DeclareMathSymbol{k}{\mathalpha}{letters}{‘k}
180 \DeclareMathSymbol{l}{\mathalpha}{letters}{‘l}
181 \DeclareMathSymbol{m}{\mathalpha}{letters}{‘m}
182 \DeclareMathSymbol{n}{\mathalpha}{letters}{‘n}
183 \DeclareMathSymbol{o}{\mathalpha}{letters}{‘o}
184 \DeclareMathSymbol{p}{\mathalpha}{letters}{‘p}
185 \DeclareMathSymbol{q}{\mathalpha}{letters}{‘q}
186 \DeclareMathSymbol{r}{\mathalpha}{letters}{‘r}
187 \DeclareMathSymbol{s}{\mathalpha}{letters}{‘s}
188 \DeclareMathSymbol{t}{\mathalpha}{letters}{‘t}
189 \DeclareMathSymbol{u}{\mathalpha}{letters}{‘u}
190 \DeclareMathSymbol{v}{\mathalpha}{letters}{‘v}
191 \DeclareMathSymbol{w}{\mathalpha}{letters}{‘w}
192 \DeclareMathSymbol{x}{\mathalpha}{letters}{‘x}
193 \DeclareMathSymbol{y}{\mathalpha}{letters}{‘y}
194 \DeclareMathSymbol{z}{\mathalpha}{letters}{‘z}

195 \DeclareMathSymbol{A}{\mathalpha}{letters}{‘A}
196 \DeclareMathSymbol{B}{\mathalpha}{letters}{‘B}
197 \DeclareMathSymbol{C}{\mathalpha}{letters}{‘C}
198 \DeclareMathSymbol{D}{\mathalpha}{letters}{‘D}
199 \DeclareMathSymbol{E}{\mathalpha}{letters}{‘E}
200 \DeclareMathSymbol{F}{\mathalpha}{letters}{‘F}
201 \DeclareMathSymbol{G}{\mathalpha}{letters}{‘G}
202 \DeclareMathSymbol{H}{\mathalpha}{letters}{‘H}
203 \DeclareMathSymbol{I}{\mathalpha}{letters}{‘I}
204 \DeclareMathSymbol{J}{\mathalpha}{letters}{‘J}
205 \DeclareMathSymbol{K}{\mathalpha}{letters}{‘K}
206 \DeclareMathSymbol{L}{\mathalpha}{letters}{‘L}
207 \DeclareMathSymbol{M}{\mathalpha}{letters}{‘M}
208 \DeclareMathSymbol{N}{\mathalpha}{letters}{‘N}
209 \DeclareMathSymbol{O}{\mathalpha}{letters}{‘O}
210 \DeclareMathSymbol{P}{\mathalpha}{letters}{‘P}
211 \DeclareMathSymbol{Q}{\mathalpha}{letters}{‘Q}
212 \DeclareMathSymbol{R}{\mathalpha}{letters}{‘R}
213 \DeclareMathSymbol{S}{\mathalpha}{letters}{‘S}
```

```

214 \DeclareMathSymbol{T}{\mathalpha}{letters}{‘T}
215 \DeclareMathSymbol{U}{\mathalpha}{letters}{‘U}
216 \DeclareMathSymbol{V}{\mathalpha}{letters}{‘V}
217 \DeclareMathSymbol{W}{\mathalpha}{letters}{‘W}
218 \DeclareMathSymbol{X}{\mathalpha}{letters}{‘X}
219 \DeclareMathSymbol{Y}{\mathalpha}{letters}{‘Y}
220 \DeclareMathSymbol{Z}{\mathalpha}{letters}{‘Z}

```

6.3.2 The digits

```

221 \DeclareMathSymbol{0}{\mathalpha}{operators}{‘0}
222 \DeclareMathSymbol{1}{\mathalpha}{operators}{‘1}
223 \DeclareMathSymbol{2}{\mathalpha}{operators}{‘2}
224 \DeclareMathSymbol{3}{\mathalpha}{operators}{‘3}
225 \DeclareMathSymbol{4}{\mathalpha}{operators}{‘4}

253 \mathcode‘\prime = "8000 % ^\prime
254 \mathcode‘\_ = "8000 % \_

```

6.3.4 Delimitercodes for characters

[to be completed]

Finally, `InitEX` sets all `\delcode` values to -1, except `\delcode‘.=0`

```

255 \DeclareMathDelimiter{\mathopen}{operators}{28}{largesymbols}{00}
256 \DeclareMathDelimiter{\mathclose}{operators}{29}{largesymbols}{01}
257 \DeclareMathDelimiter{\mathopen}{operators}{5B}{largesymbols}{02}
258 \DeclareMathDelimiter{\mathclose}{operators}{5D}{largesymbols}{03}

```

The next two are considered to be relations when not used in the context of a delimiter! And worse, they do even represent different glyphs when being used as delimiter and not as delimiter. This is a user level syntax inherited from plain \TeX . Therefore we explicitly redefine the math symbol definitions for these symbols afterwards.

```

259 \DeclareMathDelimiter{\mathopen}{symbols}{68}{largesymbols}{0A}
260 \DeclareMathDelimiter{\mathclose}{symbols}{69}{largesymbols}{0B}
261 \DeclareMathSymbol{\mathrel}{letters}{3C}
262 \DeclareMathSymbol{\mathrel}{letters}{3E}

```

And here is another case where the non-delimiter version produces a glyph different from the delimiter version.

```

263 \DeclareMathDelimiter{\mathord}{operators}{2F}{largesymbols}{0E}
264 \DeclareMathSymbol{\mathord}{letters}{3D}

265 \DeclareMathDelimiter{\mathord}{symbols}{6A}{largesymbols}{0C}

266 \expandafter\DeclareMathDelimiter\@backslashchar
267 \mathord{symbols}{6E}{largesymbols}{0F}

```

N.B. { and } should NOT get delcodes; otherwise parameter grouping fails!

```

In contrast to `plain.tex` `\Relbar` got braces around the equal sign to guard against it being “math active” expanding to `\futurelet....`. This might be the case when packages are implementing shorthands for math, e.g. `=>` meaning `\Rightarrow` etc. It would actually be better not to use `=` in such definitions but instead define something like `\mathequalsign` and use this. However we can’t do this now as it would break other math layouts where characters are in different places (since those wouldn’t know about the need for a new command name).

```

```

563 \DeclareMathDelimiter{\lmoustache} % top from (, bottom from )
564 {\mathopen}{largesymbols}{7A}{largesymbols}{40}
565 \DeclareMathDelimiter{\rmoustache} % top from ), bottom from (
566 {\mathclose}{largesymbols}{7B}{largesymbols}{41}
567 \DeclareMathDelimiter{\arrowvert} % arrow without arrowheads
568 {\mathord}{symbols}{6A}{largesymbols}{3C}
569 \DeclareMathDelimiter{\Arrowvert} % double arrow without arrowheads
570 {\mathord}{symbols}{6B}{largesymbols}{3D}
571 \DeclareMathDelimiter{\Vert}
572 {\mathord}{symbols}{6B}{largesymbols}{0D}

```

`\DeclareMathDelimiter` produces a command that is robust (with an internal macro containing the payload) so we should not use `\let` for making an alias

```

573 %\let\l=\Vert
574 \DeclareMathDelimiter{\l}
575 {\mathord}{symbols}{6B}{largesymbols}{0D}
576 \DeclareMathDelimiter{\vert}
577 {\mathord}{symbols}{6A}{largesymbols}{0C}
578 \DeclareMathDelimiter{\uparrow}
579 {\mathrel}{symbols}{22}{largesymbols}{78}
580 \DeclareMathDelimiter{\downarrow}
581 {\mathrel}{symbols}{23}{largesymbols}{79}
582 \DeclareMathDelimiter{\updownarrow}
583 {\mathrel}{symbols}{6C}{largesymbols}{3F}
584 \DeclareMathDelimiter{\Uparrow}
585 {\mathrel}{symbols}{2A}{largesymbols}{7E}
586 \DeclareMathDelimiter{\Downarrow}
587 {\mathrel}{symbols}{2B}{largesymbols}{7F}
588 \DeclareMathDelimiter{\Updownarrow}
589 {\mathrel}{symbols}{6D}{largesymbols}{77}
590 \DeclareMathDelimiter{\backslash} % for double coset G\backslash H
591 {\mathord}{symbols}{6E}{largesymbols}{0F}
592 \DeclareMathDelimiter{\rangle}
593 {\mathclose}{symbols}{69}{largesymbols}{0B}
594 \DeclareMathDelimiter{\langle}
595 {\mathopen}{symbols}{68}{largesymbols}{0A}
596 \DeclareMathDelimiter{\rbrace}
597 {\mathclose}{symbols}{67}{largesymbols}{09}
598 \DeclareMathDelimiter{\lbrace}
599 {\mathopen}{symbols}{66}{largesymbols}{08}
600 \DeclareMathDelimiter{\rceil}
601 {\mathclose}{symbols}{65}{largesymbols}{07}
602 \DeclareMathDelimiter{\lceil}
603 {\mathopen}{symbols}{64}{largesymbols}{06}
604 \DeclareMathDelimiter{\rfloor}
605 {\mathclose}{symbols}{63}{largesymbols}{05}
606 \DeclareMathDelimiter{\lfloor}
607 {\mathopen}{symbols}{62}{largesymbols}{04}

```

`\lgroup` There are three plain TeX delimiters which are not fully supported by NFSS, since they
`\rgroup` partly point into a bold cmr font. Allocating a full symbol font, just to have three
`\bracevert` delimiters seems a bit too much given the limited space available. For this reason only
the extensible sizes are supported. If this is not desired one can use, without losing
portability, define `\mathbf` and `\mathtt` as font symbol alphabet (setting up `cmr/bx/n`
and `cmtt/m/n` as symbol fonts first) and modify the delimiter declarations to point with
their small variant to those symbol fonts. (This is done in `oldlfont.dtx` so look there
for examples.)

```

608 \DeclareMathDelimiter{\lgroup} % extensible ( with sharper tips
609     {\mathopen}{largesymbols}{"3A}{largesymbols}{"3A}
610 \DeclareMathDelimiter{\rgroup} % extensible ) with sharper tips
611     {\mathclose}{largesymbols}{"3B}{largesymbols}{"3B}
612 \DeclareMathDelimiter{\bracevert} % the vertical bar that extends braces
613     {\mathord}{largesymbols}{"3E}{largesymbols}{"3E}

```

(End definition for `\lgroup`, `\rgroup`, and `\bracevert`.)

6.5 Math versions of text commands

The `\mathunderscore` here is really a text definition, so it has been put back into
`loutenc.dtx` (by Chris, 30/04/97) and should be removed from here.

These symbols are the math versions of text commands such as `\P`, `\$`, etc.

```

\mathparagraph These math symbols are not in plain TeX.
\mathsection 614 \DeclareMathSymbol{\mathparagraph}{\mathord}{symbols}{"7B}
\mathdollar   615 \DeclareMathSymbol{\mathsection}{\mathord}{symbols}{"78}
\mathsterling 616 \DeclareMathSymbol{\mathdollar}{\mathord}{operators}{"24}
\mathunderscore 617 \DeclareRobustCommand\mathsterling{\mathit{\mathchar"7024}}
                618 \DeclareRobustCommand\mathunderscore{\kern.06em\vbox{\hrule\@width.3em}}

```

(End definition for `\mathparagraph` and others.)

`\mathellipsis` This is plain TeX's `\ldots`.

```

619 \DeclareRobustCommand\mathellipsis{\mathinner{\ldotp\ldotp\ldotp}}%

```

(End definition for `\mathellipsis`.)

6.6 Other special functions and parameters

6.6.1 Biggggg

```

620 </math>
621 <*math | latexrelease>
622 <[latexrelease] \IncludeInRelease{2018/12/01}%
623 <[latexrelease]           {\Big}{Start LR-mode}%
624 \DeclareRobustCommand\big[1]{\leavevmode@ifvmode

```
672 %%  
673 </cfgtext | cfgmath | cfgprel>
```

File z

preload.dtx

1 Overview

This file contains an number of possible settings for preloading fonts during installation of NFSS2 (which is used by L^AT_EX 2_ε). It will be used to generate the following files:

preload.min	minimal subset of fonts necessary to run NFSS2
preload.ori	preload of CM fonts similar to the old <code>lfonts.tex</code>
preload.ltx	The standard selection of preloads
cmpreload.xpt	preload of CM fonts for 10pt document size
cmpreload.xip	preload of CM fonts for 11pt document size
cmpreload.xii	preload of CM fonts for 12pt document size
dcpreload.xpt	preload of DC fonts for 10pt size
dcpreload.xip	preload of DC fonts for 11pt size
dcpreload.xii	preload of DC fonts for 12pt size

These files are for installations that make use of Computer Modern fonts either old encoding (OT1) or Cork encoding (T1). The Computer Modern fonts with Cork encoding are known as DC-fonts.

Most important is `preload.ltx` which is used during format generation. You are *not* allowed to change this file.

2 Customization

You can customize the preloaded fonts in your L^AT_EX 2_ε system by installing a file with the name `preload.cfg`. If this file exists it will be used in place of the system file `preload.ltx`. You can, for example, copy one of the files mentioned above (that can be generated from this source) to `preload.cfg`.

Or you can define completely other preloads. In that case start from `preload.min` since that contains the fonts that have to be preloaded by **all** L^AT_EX 2_ε systems.

Avoid using `preload.ori`, it will load so many fonts that on most installations it is nearly impossible to load other font families afterwards. This file is only generated to show what fonts have been preloaded by L^AT_EX 2.09.

If you normally use other fonts than Computer Modern `preload.min` might be best.

Warning: If you preload fonts with encodings other than the normally supported encodings you have to declare that encoding in a `fontdef.cfg` configuration file (see the documentation in the file `fontdef.dtx`). Adding an extra encoding to the format might produce non-portable documents, thus this should be avoided if possible.

3 Module switches for the DOCSTRIP program

The DOCSTRIP will generate the above file from this source using the following module directives:

driver	produce a documentation driver file
preload	produce a preload... file
cm	for OT1 encoded Computer Modern
dc	for T1 encoded Computer Modern
min	produce minimal subset
xpt	produce 10pt preloads
xipt	produce 11pt preloads
xipt	produce 12pt preloads
ori	produce preloads similar to old <code>lfonts.tex</code>
tex	produce <code>preload.ltx</code>

A typical DOCSTRIP command file would then have entries like:

```
generateFile{preload.min}{t}{\from{preload.dtx}{preload,min}}
```

for generating preload files.

4 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```

1 <*driver>
2 \documentclass{ltxdoc}
3 %\OnlyDescription % comment out for implementation details
4 \begin{document}
5   \DocInput{preload.dtx}
6 \end{document}
7 </driver>
```

5 The code

We begin by loading the math extension font (cmex10) and the L^AT_EX line and circle fonts. It is necessary to do this explicitly since these are used by `lplain.tex` and `latex.tex`. Since the internal font name contains / characters and digits we construct the name via `\csname`. These are the only fonts (!) that must be loaded in this file.

All `\DeclarePreloadSizes` can be removed or others can be added, they only influence the processing speed.

```

8 \expandafter\font\csname OMX/cmex/m/n/10\endcsname=cmex10\relax
9 \font\tenln =line10 \font\tenlnw =linew10\relax
10 \font\tencirc=lcircle10 \font\tencircw=lcirclew10\relax
```

The above fonts should not be touched but anything below this point here in the preload suggestions can be modified without any problems.

```

11 <-tex>%*****
12 <-tex>% Start any modification below this point **
13 <-tex>%*****
14 <-tex>

```

File A

lftntcmd.dtx

Abstract

The commands defined in this file `lftntcmd` are part of the kernel code for $\text{\LaTeX} 2_{\epsilon}/\text{NFSS2}$.

It is also meant to serve as documentation for package writers since it demonstrates how to define high-level font changing commands using a small number of creator functions.

1 Introduction

Font changes such as `\bfseries`, `\sffamily`, etc. are declarations; this means that their scope is delimited by the grouping structure, either by the next `\end` of some environment or by explicitly using a group, e.g., writing something like `{\bfseries...}` in the source. If you make the mistake of writing `\bfseries{...}` (thinking of `\bfseries` as a command with one argument) then the result is rather striking.

Font declarations are an artifact of the \TeX system and for several reasons it is better to avoid them on the user level whenever possible. In $\text{\LaTeX}3$ they will probably all be replaced by environments and by font commands taking one argument.

This file defines a creator function for such declarative font switches. This function creates commands which can be used in both math and text.

This file also defines a number of high-level commands (all starting with `\text..`) that have one argument and typeset this argument in the requested way. Thus these commands are for typesetting short pieces of text in a specific family, series or shape. These are all produced as examples of the use of a creator function which is itself also defined in this file.

Table 1 shows all these high-level commands in action. A further advantage of using these commands is that they automatically take care of any necessary italic correction on either side of their argument.

Thus, when using such commands, one does not have to worry about forgetting the italic correction when changing fonts. Only in very few situations is this additional space wrong but, for example, most typographers recommend omitting the italic correction if a small punctuation character, like a comma, directly follows the font change. Since the amount of correction required is partly a matter of taste, you can define in what situations the italic correction should be suppressed. This is done by putting the characters that should cancel a preceding italic correction in the list `\nocorrlist`.¹⁷ The default definition for this list is produced by the following.

```
\newcommand \nocorrlist {,.}
```

It is best to declare the most often used characters first, because this will make the processing slightly faster. For example,

```
\emph{When using the \NFSS{} high-level commands,  
the \emph{proper} use of italic corrections is  
automatically taken care of}. Only
```

¹⁷Any package that changes the `\catcode` of a character inside `\nocorrlist` must then explicitly reset the list. Otherwise the changed character will no longer be recognized by the suppression algorithm.

<i>Command</i>	<i>Corresponds to</i>	<i>Action</i>
<code>\textnormal{..}</code>	<code>\normalfont</code>	Typeset argument in normal family
<code>\textrm{..}</code>	<code>\rmfamily</code>	Typeset argument in roman family
<code>\textsf{..}</code>	<code>\sffamily</code>	Typeset argument in sans serif family
<code>\texttt{..}</code>	<code>\ttfamily</code>	Typeset argument in typewriter family
<code>\textmd{..}</code>	<code>\mdseries</code>	Typeset argument in medium series
<code>\textbf{..}</code>	<code>\bfseries</code>	Typeset argument in bold series
<code>\textup{..}</code>	<code>\upshape</code>	Typeset argument in normal shape
<code>\textit{..}</code>	<code>\itshape</code>	Typeset argument in <i>italic</i> shape
<code>\textsl{..}</code>	<code>\slshape</code>	Typeset argument in <i>slanted</i> shape
<code>\textsc{..}</code>	<code>\scshape</code>	Typeset argument in SMALL CAPS shape
<code>\emph{..}</code>	<code>\em</code>	Typeset argument <i>emphasized</i>

Table 1: Font-change commands with arguments

The font change commands provided here all start with `\text..` to emphasize that they are for use in normal text and to be easily memorable. They automatically take care of any necessary italic correction on either side of the argument.

`\emph{sometimes}` one has to help `\LaTeX{}` by adding a `\verb=\nocorr=` command.

which results in:

When using the NFSS high-level commands, the proper use of italic corrections is automatically taken care of. Only sometimes one has to help L^AT_EX by adding a `\nocorr` command.

In contrast, the use of the declaration forms is often more appropriate when you define your own commands or environments.

```
\newenvironment{bfitemize}{\begin{itemize}\normalfont\bfseries}
                          {\end{itemize}}
\begin{bfitemize}
\item This environment produces boldface items.
\item It is defined in terms of \LaTeX's
      \texttt{itemize} environment and NFSS
      declarations.
\end{bfitemize}
```

This gives:

- **This environment produces boldface items.**
- **It is defined in terms of L^AT_EX's `itemize` environment and NFSS declarations.**

In addition to global customization of when to insert the italic correction, it is of course sometimes necessary to explicitly insert one with `\/`.

It is also possible to suppress the italic correction in individual instances. For this, the command `\nocorr` is provided.

The `\nocorr` must appear as the first or last token inside the braces of the argument of the `\text...` commands, at that end of the text where you wish to suppress the italic correction.

It is worth pointing out here that inserting a `\/` in places where it can have no function (i.e. anywhere except immediately after a slanted letter) is not an error—it will just be silently ignored. Unfortunately this is not true if the redefinition of `\/` in `amstex.sty` is used as this version can cause space to be removed immediately before the `\/`.

2 The implementation

`\DeclareTextFontCommand` This is the creator function for `\text..` commands. It gives a warning if `\foo` or `\fragfoo` is already defined.

In math mode it simply puts the font declaration and text into a box (possibly an automagically sized one).

Otherwise it first scans the text to see where `\nocorr` occurs within it. This sets the `\check@ic` commands to do what is necessary concerning the italic correction at both ends.

The algorithm for deciding whether to put in an italic correction is not very subtle: one is added whenever the newly current font is not itself positively sloped, unless the next token is a character in the ‘nocorr’ list. At the end of the text this is done after closing the group so as to check the ‘outer font’. Note that this will often result in adding an italic correction token after a character in an unsloped font; we believe (in early 2003) that this is perhaps inefficient but not dangerous.

It also now checks for empty contents of the text command and optimizes this case. Some care is also taken to check that doing dangerous things in vertical mode is avoided.

The italic correction token is added to the horizontal list before (in the list) an immediately preceding non-zero glob of glue (skip) and any non-zero penalty preceding that since, in the typical case, this puts it immediately after the last character in the preceding word.

Note that it is necessary to put in the `\aftergroup\maybe@ic` at the end of the group so that it comes after any other aftergroup tokens and immediately before the following tokens. It is also necessary to remove the `\fi` from the token list before the group ends; this is done by adding an `\expandafter` just before the closing brace.

```

1  \langle*2kernel\rangle
2  \def \DeclareTextFontCommand #1#2{%
3    \DeclareRobustCommand#1[1]{%
4      \ifmmode
5        \nfss@text{#2##1}%
6      \else
7        \hmode\bgroup
8        \text@command{##1}%
9        #2\check@icl ##1\check@icr
10       \expandafter
11       \egroup
12       \fi
13           }%
14  }
```

```

(End definition for \DeclareTextFontCommand.)

\textrm Now we define the \text<family> commands in terms of the above; \texttt does not
\textsf look very nice!
\texttt 15 \DeclareTextFontCommand{\textrm}{\rmfamily}
\textnormal 16 \DeclareTextFontCommand{\textsf}{\sffamily}
17 \DeclareTextFontCommand{\texttt}{\ttfamily}
18 \DeclareTextFontCommand{\textnormal}{\normalfont}

(End definition for \textrm and others.)

\textbf For the series attribute:
\textmd 19 \DeclareTextFontCommand{\textbf}{\bfseries}
20 \DeclareTextFontCommand{\textmd}{\mdseries}

(End definition for \textbf and \textmd.)

\textit And for the shapes:
\textsl 21 \DeclareTextFontCommand{\textit}{\itshape}
\textsc 22 \DeclareTextFontCommand{\textsl}{\slshape}
\textup 23 \DeclareTextFontCommand{\textsc}{\scshape}
24 \DeclareTextFontCommand{\textup}{\upshape}

(End definition for \textit and others.)

textulc
textsw 25 </2ekernel>
textssc 26 <*2ekernel | latexrelease>
27 <latexrelease>\IncludeInRelease{2020/02/02}%
28 <latexrelease> {\textulc}{Additional text commands}%
29 \DeclareTextFontCommand{\textulc}{\ulcshape}
30 \DeclareTextFontCommand{\textsw}{\swshape}
31 \DeclareTextFontCommand{\textssc}{\sscshape}
32 </2ekernel | latexrelease>
33 <latexrelease>\EndIncludeInRelease
34 <latexrelease>\IncludeInRelease{0000/00/00}%
35 <latexrelease> {\textulc}{Additional text commands}%
36 <latexrelease>
37 <latexrelease>\let\textulc\@undefined
38 <latexrelease>\let\textsw\@undefined
39 <latexrelease>\let\textssc\@undefined
40 <latexrelease>\EndIncludeInRelease
41 <*2ekernel>

(End definition for textulc, textsw, and textssc.)

\emph Finally we have the \em font change declaration of LATEX. The corresponding definition
with argument is
42 \DeclareTextFontCommand{\emph}{\em}

(End definition for \emph.)

\nocorr This is just a label, so it does nothing; it should also be unexpandable.
43 \let \nocorr \relax

```

(End definition for `\nocorr`.)

`\check@ic1` We define these defaults in case some error causes them to be expanded at the wrong
`\check@icr` time.

```
44 \let \check@ic1 \@empty
45 \let \check@icr \@empty
```

(End definition for `\check@ic1` and `\check@icr`.)

`\text@command` This checks for a `\nocorr` as the first token in its argument and also for one in any other
`\check@nocorr@` position not protected within braces (the latter is treated as if it were at the end of the argument).

Is this the correct action in the ‘empty’ case? It is efficient but typographically it is, strictly, incorrect!

```
46 \def \text@command #1{%
47   \def \reserved@a {#1}%
48   \ifx \reserved@a \@empty
49     \let \check@ic1 \@empty
50     \let \check@icr \@empty
51   \else
```

`\space` is a reserved word in L^AT_EX or actually already in plain T_EX. If somebody really redefines it so many things will break that I don’t see any reason to make this routine here slower than necessary.

```
52 %   \def \reserved@b { }%
53 %   \ifx \reserved@a \reserved@b
54   \ifx \reserved@a \space
55     \let \check@ic1 \@empty
56     \let \check@icr \@empty
57   \else
58     \check@nocorr@ #1\nocorr\@nil
59   \fi
60 \fi
61 }
62 \def \check@nocorr@ #1#2\nocorr#3\@nil {%
```

The two checks are initialised here to their values in the normal case.

```
63 \let \check@ic1 \maybe@ic
64 \def \check@icr {\ifvmode \else \aftergroup \maybe@ic \fi}%
65 \def \reserved@a {\nocorr}%
66 \def \reserved@b {#1}%
67 \def \reserved@c {#3}%
68 \ifx \reserved@a \reserved@b
69   \ifx \reserved@c \@empty
```

In this case there is a `\nocorr` at the start but not at the end, so `\check@ic1` should be empty.

```
70   \let \check@ic1 \@empty
71 \else
```

Otherwise there is a `\nocorr` both at the start and elsewhere, so no italic corrections should be added.

```
72   \let \check@ic1 \@empty
73   \let \check@icr \@empty
74 \fi
```

```

75 \else
76 \ifx \reserved@c \@empty

```

In this case there is no `\nocorr` anywhere, so we need to check for an italic correction at both the beginning and the end. This has been set up as the default so no code is needed here.

```

77 \else

```

In this case there is no `\nocorr` at the start but there is one elsewhere, so no `\aftergroup` is needed.

```

78 \let \check@icr \@empty
79 \fi
80 \fi
81 }

```

(End definition for \text@command and \check@nocorr@.)

`\ifmaybe@ic` Switch used solely within `\maybe@ic` not interfering with other switches.

```

82 \newif\ifmaybe@ic

```

(End definition for \ifmaybe@ic.)

`\maybe@ic` These macros implement the italic correction.

```

\maybe@ic@
83 \def \maybe@ic {\futurelet \@let@token \maybe@ic@}
84 \def \maybe@ic@ {%

```

We first check to see if the current font is positively sloped. (But do not forget the message Rainer sent about an upright font with non-zero slope! Or is this an urban myth?) It has been suggested that this should test against a small positive value, but what?

```

85 \ifdim \fontdimen\@ne\font>\z@
86 \else
87 \maybe@ictrue

```

It would be possible, but probably not worthwhile, to continue the forward scan beyond any closing braces.

```

88 \expandafter \@tfor \expandafter \reserved@a \expandafter : \expandafter = %
89 \nocorrlist

```

We have to hide the `\@let@token` in the macro `\t@st@ic` rather than testing it directly in the loop since it might be `\let` to a `\fi` or `\else`, which would result in chaos.

```

90 \do \t@st@ic

```

Frank thinks that the next bit is inefficient if done after the second change. Chris thinks that most all of this is inefficient for the commonest cases: but that is the price of a cleverer algorithm. It is certainly needed to deal with the use of `\nolinebreak`.

```

91 \ifmaybe@ic \sw@slant \fi
92 \fi
93 }

```

(End definition for \maybe@ic and \maybe@ic@.)

`\t@st@ic` The next token in the input stream is stored in `\@let@token` via a `\let`, the current token from `\nocorrlist` is stored via `\def` in `\reserved@a`. To compare them we have to fiddle around a bit.

If the only things to check were characters then this could be done via an `\if` thus their catcodes would not matter; but this will not work whilst `\futurelet` is used above.

```

94 \def \t@st@ic {%
95   \expandafter\let\expandafter\reserved@b\expandafter=\reserved@a\relax
96   \ifx\reserved@b\@let@token

```

If they are the same we record the fact and jump out of the loop.

```

97     \maybe@icfalse
98     \@break@tfor
99   \fi
100 }

```

(End definition for `\t@st@ic`.)

`\sw@slant` The definition of the mysterious `\sw@slant` command is as follows.
`\fix@penalty` 101 `\def \sw@slant {%`

It is surely correct to put in an italic correction when there is no skip. If the last thing on the list is actually a zero skip (including things whose dimension part is zero, such as `\hfill`), or anything other than a character, then the italic correction will have no effect.

In order to work correctly with unbreakable spaces from `~` (and other common forms of line-breaking control) we also move back across a penalty before the glue.

```

102   \ifdim \lastskip=\z@
103     \fix@penalty
104   \else
105     \skip@ \lastskip
106     \unskip
107     \fix@penalty
108     \hskip \skip@
109   \fi
110 }

```

The above code means: “If there is a non-zero space just before the current position (`\ifdim...`) save the amount of that space (`\skip@\lastskip`), remove it (`\unskip`), then do a similar thing if there is a penalty just before the skip, and finally put the space back in.”

Since zero glue cannot be distinguished in this context from no glue, we dare not put in an `\hskip` in this case as this may produce an unwanted breakpoint. This is not satisfactory.

The penalty before the glue is handled similarly, with the same caveats concerning the zero case. Is this the first recorded use of `\unpenalty` in standard L^AT_EX code?

```

111 \def \fix@penalty {%
112   \ifnum \lastpenalty=\z@
113     @@italiccorr
114   \else
115     \count@ \lastpenalty
116     \unpenalty
117     @@italiccorr

```

```

118     \penalty \count@
119     \fi
120 }

```

(End definition for `\sw@slant` and `\fix@penalty`.)

\nocorrlist This holds the list of characters that should prevent italic correction. They should be ordered by decreasing frequency of use. If any such character is made active later on one needs to redefine the list so that the active character becomes part of it.

```

121 \def \nocorrlist {,.}

```

(End definition for `\nocorrlist`.)

\nfss@text This command will by default behave like a L^AT_EX `\mbox` but may be redefined by packages such as `amstext.sty` to be a bit cleverer.

```

122 \ifx \nfss@text\undefined
123   \def \nfss@text {\leavevmode\hbox}
124 \fi

```

(End definition for `\nfss@text`.)

\DeclareOldFontCommand This is the function used to create declarative font-changing commands that can also be used to change alphabets in math-mode.

Usage: `\DeclareOldFontCommand \fn{<font-change decls>} <math-alphabet>`

Here `\fn` is the font-declaration command being defined, `<font-change decls>` is the declaration it will expand to in text-mode, and `<math-alphabet>` is the (single) math alphabet specifier which is to be used in math-mode.

It does not care whether the command being defined already exists but it does give a warning if it redefines anything.

Here are some typical examples of its use in conjunction with more basic NFSS2 font commands.

```

\DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}
\DeclareOldFontCommand{\sf}{\normalfont\sffamily}{\mathsf}
\DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathtt}

```

```

125 \def \DeclareOldFontCommand #1#2#3{%
126   \DeclareRobustCommand #1{\@fontswitch {#2}{#3}}%
127 }

```

(End definition for `\DeclareOldFontCommand`.)

\@fontswitch **\@math@egroup** These two commands actually do the necessary tests and declarative font- or alphabet-changing.

```

\@math@egroup
\@math@egroup
128 \def \@fontswitch #1#2{%
129   \ifmmode
130     \let \math@bgroup \relax
131     \def \math@egroup {\let \math@bgroup \@math@bgroup
132                       \let \math@egroup \@math@egroup}%

```

We need to have a `\relax` in the following line in case the `#2` is something like `\mathsf` grabbing the next token as an argument. For this reason the code also uses explicit arguments again (see pr/1275).

```

133     #2\relax
134   \else
135     #1%
136   \fi
137 }
138 \let \@@math@bgroup \math@bgroup
139 \let \@@math@egroup \math@egroup

(End definition for \@fontswitch, \@@math@egroup, and \@@math@egroup.)
These commands are available only in the preamble.
140 \@onlypreamble \DeclareTextFontCommand
141 \@onlypreamble \DeclareOldFontCommand

```

3 Initialization

```

\normalsize This is defined to produce an error.
142 \def\normalsize{%
143   \@latex@error {The font size command \protect\normalsize\space
144                 is not defined:\MessageBreak
145                 there is probably something wrong with
146                 the class file}\@eha
147 }
148 \</2ekernel>

(End definition for \normalsize.)

```

File B

ltxtextcomp.dtx

From File: ltxtextcomp.dtx

This file contains the implementation for accessing the glyphs provided by the TS1 encoding (Text Companion Encoding). This is now offered as part of the kernel and so the `textcomp` package which used to provide the definitions is now mainly needed for compatibility reasons (and doesn't do much any more).

`\oldstylenums`
`\legacyoldstylenums`

Preserve the old definition of `\oldstylenums` under a different name.

This macro implements old style numerals but only works if we assume that the standard math fonts are used. Thus it needs changing in case other math encodings are used.

```
1 <*2ekernel | latexrelease>
2 <latexrelease>\IncludeInRelease{2020/02/02}%
3 <latexrelease>          {\oldstylenums}{Old style numerals}%
4 \DeclareRobustCommand\legacyoldstylenums[1]{%
5   \begingroup
```

Provide spacing using the interword space of the current font.

```
6   \spaceskip\fontdimen\tw@\font
```

Then switch to the math italic font. We don't change the current value of `\f@series` which means that you can use bold numerals if `\bfseries` is in force. As family we use `\rmdefault` which means that this only works if there exist an OML encoded version of that font or rather a corresponding .fd file (which is the case for standard L^AT_EX fonts even though they only contain substitutions).

```
7   \usefont{OML}{\rmdefault}{\f@series}{it}%
8   \mathgroup\symletters #1%
9   \endgroup
10 }
```

And here is the improved one that adjusts depending on surroundings.

```
11 \DeclareRobustCommand\oldstylenums[1]{%
12   \begingroup
13   \ifmmode
14     \mathgroup\symletters #1%
15   \else
```

The `\CheckEncodingSubset` is discussed below.

```
16   \CheckEncodingSubset\@use@text@encoding{TS1}\tc@oldstylesubst2{{#1}}%
17   \fi
18   \endgroup
19 }
```

The helper to select the substitution if needed.

```
20 \def\tc@oldstylesubst#1{%
21   \tc@errorwarn
22     {Oldstyle digits unavailable for
23     family \f@family.\MessageBreak
24     Default oldstyle digits used instead}\@eha
25   \bgroup
26   \expand@font@defaults
```

The substitution defaults are provided in the file `fonttext.ltx`.

```

27     \ifx\f@family\rmdef@ult
28         \fontfamily\rmsubstdefault
29     \else\ifx\f@family\sfddef@ult
30         \fontfamily\sfsbstdefault
31     \else\ifx\f@family\ttdef@ult
32         \fontfamily\ttsbstdefault
33     \else
34         \fontfamily\textcompsubstdefault
35     \fi\fi\fi
36     \fontencoding{TS1}\selectfont#1%
37 \egroup
38 }

```

(End definition for `\oldstylenums` and `\legacyoldstylenums`.)

`\textcompsubstdefault` Here is the default for the “unknown” case:

```

39 \def\textcompsubstdefault{\rmsubstdefault}

(End definition for \textcompsubstdefault.)

40 </2ekernel | latexrelease>
41 <latexrelease>\EndIncludeInRelease
42 <latexrelease>\IncludeInRelease{0000/00/00}%
43 <latexrelease>           {\oldstylenums}{Old style numerals}%
44 <latexrelease>
45 <latexrelease>\DeclareRobustCommand\oldstylenums[1]{%
46 <latexrelease>     \begingroup
47 <latexrelease>     \spaceskip\fontdimen\tw@font
48 <latexrelease>     \usefont{OML}{\rmdefault}{\f@series}{it}%
49 <latexrelease>     \mathgroup\symletters #1%
50 <latexrelease>     \endgroup
51 <latexrelease>}
52 <latexrelease>\let\legacyoldstylenums\@undefined
53 <latexrelease>\def\textcompsubstdefault{cmr}
54 <latexrelease>
55 <latexrelease>\EndIncludeInRelease

```

Everything else in the this file got introduced 2020/02/02, so we do a single rollback (for now).

```

56 <*2ekernel>
57 </2ekernel>
58 <*2ekernel | latexrelease>
59 <latexrelease>\IncludeInRelease{2020/02/02}%
60 <latexrelease>     {\DeclareEncodingSubset}{Text companion symbols}%

```

`\DeclareEncodingSubset` The declaration takes 3 mandatory arguments: an *encoding* for which a subsetting is wanted (currently always `TS1`, and most likely forever), the *font family* for which we declare the subset and finally the *subset* number (between 0 (all of the encoding is supported) and 9 many glyphs are missing).

For `TS1` the numbers have been chosen in a way that most fonts can be fairly correctly categorized, but the default settings are always conservative, that is they may claim that less glyphs are supported than there actually are.

As these days many font families are set up to end in `-LF` (lining figures), `-OsF` (oldstyle figures), etc. the declaration supports a shortcut: if the *font family* name ends in `-*` then the star gets replaced by these common ending, e.g.,

```
\DeclareEncodingSubset{TS1}{Alegreya-*}{2}
```

is the same as writing

```
\DeclareEncodingSubset{TS1}{Alegreya-LF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-OsF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-TLF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-TOsF}{2}
```

If only some are needed then one can define them individually but in many cases all four are wanted, hence the shortcut.

The coding of the declaration has no error checking as it is mostly for internal use.

```
61 \def\DeclareEncodingSubset#1#2{%
62   \DeclareEncodingSubset@aux{#1}#2*\DeclareEncodingSubset@aux
63 }
64 \def\DeclareEncodingSubset@aux#1#2*#3\DeclareEncodingSubset@aux#4{%
```

if `#3` is empty then there was no star, otherwise we define all four variants.

```
65   \expandafter\ifx\expandafter X\detokenize{#3}X%
66     \DeclareEncodingSubset{#1}{#2}{#4}%
67   \else
68     \DeclareEncodingSubset{#1}{#2LF}{#4}%
69     \DeclareEncodingSubset{#1}{#2TLF}{#4}%
70     \DeclareEncodingSubset{#1}{#2OsF}{#4}%
71     \DeclareEncodingSubset{#1}{#2TOsF}{#4}%
72   \fi
73 }
```

The subset info is stored in a command with the name `\family:subset` so if that already exists we change otherwise declare a subset.

```
74 \def\@DeclareEncodingSubset#1#2#3{%
75   \ifundefined{#1:#2}%
76     {\font@info{Setting #2 sub-encoding to #1/#3}}%
77     {\font@info{Changing #2 sub-encoding to #1/#3}}%
78     \namedef{#1:#2}{#3}}
```

Any reason to allow those in the middle of documents?

```
79 \onlypreamble\DeclareEncodingSubset
80 \onlypreamble\DeclareEncodingSubset@aux
81 \onlypreamble\@DeclareEncodingSubset
```

(End definition for `\DeclareEncodingSubset`.)

\CheckEncodingSubset The command `\CheckEncodingSubset` will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either `\UseTextSymbol`, `\UseTextAccent` depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: `#2` and `#5` of `\CheckEncodingSubset`.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute `#1{#2}#5` otherwise it runs `#3#5`, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

```

82 \def\CheckEncodingSubset#1#2#3#4#5{%
83   \ifnum #4>%
84     \expandafter\ifx\csname #2:\f@family\endcsname\relax
85     0\csname #2:?\endcsname
86   \else
87     \csname #2:\f@family\endcsname
88   \fi
89   \relax
90   \expandafter\@firstoftwo
91 \else
92   \expandafter\@secondoftwo
93 \fi
94   {#1{#2}}{#3}%
95   #5%
96 }
```

(End definition for \CheckEncodingSubset.)

To set up the glyphs for the subsets we need a number helpers.

`\tc@errorwarn` To we produce errors, warnings, or only info in the transcripts if glyphs require substitutions? By default it is “info” only. With the `textcomp` package that can be changed.

```

97 \def\tc@errorwarn#1#2{\@latex@info{#1}}
```

(End definition for \tc@errorwarn.)

`\tc@subst`

```

98 \def\tc@subst#1{%
99   \tc@errorwarn
100   {Symbol \string#1 not provided by\MessageBreak
101    font family \f@family\space
102    in TS1 encoding.\MessageBreak Default family used instead}\@eha
103   \bgroup
104     \expand@font@defaults
105     \ifx\f@family\rmdef@ult
106       \fontfamily\rmsubstdefault
107     \else\ifx\f@family\sfddef@ult
108       \fontfamily\sfsbstdefault
109     \else\ifx\f@family\ttdef@ult
110       \fontfamily\ttsbstdefault
111     \else
112       \fontfamily\textcompsubstdefault
113     \fi\fi\fi
```

Whatever default was chosen, we claim now (locally hopefully) that it can handle all slots (even if not true) to avoid looping in certain situations, e.g., when something was set up incorrectly.

```

114     \@namedef{TS1:\f@family}{0}%
115     \selectfont#1%
116   \egroup
117 }
```

(End definition for \tc@subst.)

`\tc@fake@euro` `\tc@fake@euro` is an example of a “fake” definition to use in arg #3 of the command `\CheckEncodingSubset` when a symbol is not available in a certain font family. Here we produce a poor man’s Euro symbol by combining a “C” with a “=”.

```
118 \def\tc@fake@euro#1{%
119   \leavevmode
120   \@font@info{Faking \noexpand#1for font family
121               \f@family\MessageBreak in TS1 encoding}%
122   \valign{##\cr
123     \vfil\hbox to 0.07em{\dimen@\f@size\p@
124                           \math@fontsfalse
125                           \fontsize{.7\dimen@}\z@\selectfont=\hss}%
126     \vfil\cr%
127     \hbox{C}\crrcr
128   }%
129 }
```

(End definition for \tc@fake@euro.)

`\tc@check@symbol` These are two abbreviations that we use below to check symbols and accents in TS1.
`\tc@check@accent` Only there to save some space, e.g., we can then write

`DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}`

to ensure that `\textcurrency` is only typeset if the current font has a TS1 subset id of less than 3. Otherwise `\tc@error` is called telling the user that for this font family `\textcurrency` is not available.

```
130 \def\tc@check@symbol{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@subst}
```

Accents have been made an error in the `textcomp` package when not available. Now that we provide the functionality in the kernel we avoid the error by swapping in a T1 accent if the TS1 accent is not available.

```
131 %\def\tc@check@accent{\CheckEncodingSubset\UseTextAccent{TS1}\tc@error}
132 \def\tc@check@accent#1{\CheckEncodingSubset\UseTextAccent
133                           {TS1}{\tc@swap@accent#1}}
134 \def\tc@swap@accent#1#2{\UseTextAccent{T1}#1}
```

(End definition for \tc@check@symbol and \tc@check@accent.)

1 Sub-encodings

Here are the default definitions for the TS1 symbols. First those that we assume are always available if a font implements TS1.

```
135 \DeclareTextSymbolDefault{\textdollar}{TS1}
136 \UndeclareTextCommand{\textdollar}{OT1} % don't use the OT1 def any longer
137 \DeclareTextSymbolDefault{\textsterling}{TS1}
138 \UndeclareTextCommand{\textsterling}{OT1}% don't use the OT1 def any longer
139 \DeclareTextSymbolDefault{\textperthousand}{TS1}
140 \UndeclareTextCommand{\textperthousand}{T1} % don't use the T1 def
```

Using `\UndeclareTextCommand` above is enough only if the encoding definition files are not reloaded afterwards. In the past that happened if `fontenc` was used in the document preamble (not any longer). So in some sense it is better to fully remove them from the encoding files, but for rollbacks it is easier to keep them in for now.

These are the standard `itemize` and footnote symbols originally taken from OMS and now from TS1:

```

141 \DeclareTextSymbolDefault{\textasteriskcentered}{TS1}
142 \DeclareTextSymbolDefault{\textbullet}{TS1}
143 \DeclareTextSymbolDefault{\textdaggerdbl}{TS1}
144 \DeclareTextSymbolDefault{\textdagger}{TS1}
145 \DeclareTextSymbolDefault{\textparagraph}{TS1}
146 \DeclareTextSymbolDefault{\textperiodcentered}{TS1}
147 \DeclareTextSymbolDefault{\textsection}{TS1}

```

And here are the other TS1 glyphs that are implemented by every font (or nearly every—a few are commented out and moved to sub-encoding 9, because they aren't around in some fonts.

```

148 %%\DeclareTextSymbolDefault{\textbardbl}{TS1} % subst in sub-enc 9 above
149 \DeclareTextSymbolDefault{\textbrokenbar}{TS1}
150 %%\DeclareTextSymbolDefault{\textcelsius}{TS1} % subst in sub-enc 9 above
151 \DeclareTextSymbolDefault{\textcent}{TS1}
152 \DeclareTextSymbolDefault{\textcopyright}{TS1}
153 \DeclareTextSymbolDefault{\textdegree}{TS1}
154 \DeclareTextSymbolDefault{\textdiv}{TS1}
155 \DeclareTextSymbolDefault{\textlnot}{TS1}
156 \DeclareTextSymbolDefault{\textonehalf}{TS1}
157 \DeclareTextSymbolDefault{\textonequarter}{TS1}
158 %%\DeclareTextSymbolDefault{\textonesuperior}{TS1} % subst in sub-enc 9 above
159 \DeclareTextSymbolDefault{\textordfeminine}{TS1}
160 \DeclareTextSymbolDefault{\textordmasculine}{TS1}
161 \DeclareTextSymbolDefault{\textpm}{TS1}
162 \DeclareTextSymbolDefault{\textquotesingle}{TS1}
163 \DeclareTextSymbolDefault{\textquotestraightbase}{TS1}
164 \DeclareTextSymbolDefault{\textquotestraightdblbase}{TS1}
165 \DeclareTextSymbolDefault{\textregistered}{TS1}
166 %%\DeclareTextSymbolDefault{\textthreequartersemdash}{TS1} % subst in sub-enc 9 above
167 \DeclareTextSymbolDefault{\textthreequarters}{TS1}
168 %%\DeclareTextSymbolDefault{\textthreesuperior}{TS1} % subst in sub-enc 9 above
169 \DeclareTextSymbolDefault{\texttimes}{TS1}
170 \DeclareTextSymbolDefault{\texttrademark}{TS1}
171 %%\DeclareTextSymbolDefault{\texttwelveudash}{TS1} % subst in sub-enc 9 above
172 %%\DeclareTextSymbolDefault{\texttwosuperior}{TS1} % subst in sub-enc 9 above
173 \DeclareTextSymbolDefault{\textyen}{TS1}

174 \DeclareTextSymbolDefault{\textcapitalcompwordmark}{TS1}
175 \DeclareTextSymbolDefault{\textascendercompwordmark}{TS1}

```

In the following sections the remaining default definitions are ordered by sub-encoding in which they are become unavailable (i.e., they are not provided in the sub-encoding with that number and all sub-encodings with higher numbers.

Thus the symbols that are available in sub-encoding x are the symbols above (always available) and the symbols list in the sections for sub-encodings $x + 1$ and higher.

1.1 Sub-encoding 1 (drop symbols not working in Latin Modern)

The `\textcircled` is available but the glyph is simply too small so we keep using the OMS glyph.

```
176 \DeclareTextCommandDefault{\textcircled}  
177   {\CheckEncodingSubset\UseTextAccent{TS1}{\UseTextAccent{OMS}}1\textcircled}
```

1.2 Sub-encoding 2 (majority of new OTF fonts via autointst)

```
178 \DeclareTextCommandDefault{\t}  
179   {\CheckEncodingSubset\UseTextAccent{TS1}{\UseTextAccent{OML}}2\t}
```

Capital accents are really only very seldom implemented, so from sub-encoding 2 onwards we use the normal T1 accents if they are asked for in the document.

In Unicode engines we don't implement them at all but always use the basic accents instead. whether that works or not really depends on the font, something like `\"X` usually comes out wrong in Unicode engines.

```
180 \ifx\Umathcode\@undefined  
181   \DeclareTextCommandDefault{\capitalacute}  
182     {\tc@check@accent{\'}2\capitalacute}  
183   \DeclareTextCommandDefault{\capitalbreve}  
184     {\tc@check@accent{\u}2\capitalbreve}  
185   \DeclareTextCommandDefault{\capitalcaron}  
186     {\tc@check@accent{\v}2\capitalcaron}  
187   \DeclareTextCommandDefault{\capitalcedilla}  
188     {\tc@check@accent{\c}2\capitalcedilla}  
189   \DeclareTextCommandDefault{\capitalcircumflex}  
190     {\tc@check@accent{\^}2\capitalcircumflex}  
191   \DeclareTextCommandDefault{\capitaldieresis}  
192     {\tc@check@accent{\"}2\capitaldieresis}  
193   \DeclareTextCommandDefault{\capitaldotaccent}  
194     {\tc@check@accent{\.}2\capitaldotaccent}  
195   \DeclareTextCommandDefault{\capitalgrave}  
196     {\tc@check@accent{\`}2\capitalgrave}  
197   \DeclareTextCommandDefault{\capitalhungarumlaut}  
198     {\tc@check@accent{\H}2\capitalhungarumlaut}  
199   \DeclareTextCommandDefault{\capitalmacron}  
200     {\tc@check@accent{\=}2\capitalmacron}  
201   \DeclareTextCommandDefault{\capitalogonek}  
202     {\tc@check@accent{\k}2\capitalogonek}  
203   \DeclareTextCommandDefault{\capitalring}  
204     {\tc@check@accent{\r}2\capitalring}  
205   \DeclareTextCommandDefault{\capitaltie}  
206     {\tc@check@accent{\t}2\capitaltie}  
207   \DeclareTextCommandDefault{\capitaltilde}  
208     {\tc@check@accent{\~}2\capitaltilde}
```

For `\newtie` and `\capitalnewtie` this is actually wrong, they should pick up the accent from the substitution font (not done yet).

```
209 \DeclareTextCommandDefault{\newtie}  
210   {\tc@check@accent{\t}2\newtie}  
211 \DeclareTextCommandDefault{\capitalnewtie}  
212   {\tc@check@accent{\t}2\capitalnewtie}
```

In Unicode engines we just execute the simple accents:

```

213 \else
214   \DeclareTextCommandDefault\capitalacute{\@tabacckludge'}
215   \DeclareTextCommandDefault\capitalbreve{\u}
216   \DeclareTextCommandDefault\capitalcaron{\v}
217   \DeclareTextCommandDefault\capitalcedilla{\c}
218   \DeclareTextCommandDefault\capitalcircumflex{\^}
219   \DeclareTextCommandDefault\capitaldieresis{"}
220   \DeclareTextCommandDefault\capitaldotaccent{\.}
221   \DeclareTextCommandDefault\capitalgrave{\@tabacckludge'}
222   \DeclareTextCommandDefault\capitalhungarumlaut{\H}
223   \DeclareTextCommandDefault\capitalmacron{\@tabacckludge=}
224   \DeclareTextCommandDefault\capitalnewtie{\t}
225   \DeclareTextCommandDefault\capitalogonek{\k}
226   \DeclareTextCommandDefault\capitalring{\r}
227   \DeclareTextCommandDefault\capitaltie{\t}
228   \DeclareTextCommandDefault\capitaltilde{\~}
229   \DeclareTextCommandDefault\newtie{\t}
230 \fi

```

The next two symbols exist in some fonts (faked?), but we ignore that to keep the subsets reasonable compact and most important linear.

```

231 \DeclareTextCommandDefault{\textlbrackdbl}
232       {\tc@check@symbol2\textlbrackdbl}
233 \DeclareTextCommandDefault{\textrbrackdbl}
234       {\tc@check@symbol2\textrbrackdbl}

```

Old style numerals are again in some fonts but using -OsF, etc. is the better approach to get them, so we claim they aren't in sub-encoding 2 as that's true for most fonts.

```

235 \DeclareTextCommandDefault{\texteigholdstyle}
236       {\tc@check@symbol2\texteigholdstyle}
237 \DeclareTextCommandDefault{\textfiveoldstyle}
238       {\tc@check@symbol2\textfiveoldstyle}
239 \DeclareTextCommandDefault{\textfouroldstyle}
240       {\tc@check@symbol2\textfouroldstyle}
241 \DeclareTextCommandDefault{\textnineoldstyle}
242       {\tc@check@symbol2\textnineoldstyle}
243 \DeclareTextCommandDefault{\textoneoldstyle}
244       {\tc@check@symbol2\textoneoldstyle}
245 \DeclareTextCommandDefault{\textsevenoldstyle}
246       {\tc@check@symbol2\textsevenoldstyle}
247 \DeclareTextCommandDefault{\textsixoldstyle}
248       {\tc@check@symbol2\textsixoldstyle}
249 \DeclareTextCommandDefault{\textthreeoldstyle}
250       {\tc@check@symbol2\textthreeoldstyle}
251 \DeclareTextCommandDefault{\texttwooldstyle}
252       {\tc@check@symbol2\texttwooldstyle}
253 \DeclareTextCommandDefault{\textzerooldstyle}
254       {\tc@check@symbol2\textzerooldstyle}

```

The next set of glyphs is special to T_EX fonts (and available with a few older PS fonts supported through virtual fonts), but not any longer in the majority of fonts provided through autinst, so we pretend there aren't available in sub-encoding 2 and below.

```

255 \DeclareTextCommandDefault{\textacutedbl}
256       {\tc@check@symbol2\textacutedbl}
257 \DeclareTextCommandDefault{\textasciiacute}
258       {\tc@check@symbol2\textasciiacute}

```

```

259 \DeclareTextCommandDefault{\textasciibreve}
260     {\tc@check@symbol2\textasciibreve}
261 \DeclareTextCommandDefault{\textasciicaron}
262     {\tc@check@symbol2\textasciicaron}
263 \DeclareTextCommandDefault{\textasciidieresis}
264     {\tc@check@symbol2\textasciidieresis}
265 \DeclareTextCommandDefault{\textasciigrave}
266     {\tc@check@symbol2\textasciigrave}
267 \DeclareTextCommandDefault{\textasciimacron}
268     {\tc@check@symbol2\textasciimacron}
269 \DeclareTextCommandDefault{\textgravedbl}
270     {\tc@check@symbol2\textgravedbl}
271 \DeclareTextCommandDefault{\texttildelow}
272     {\tc@check@symbol2\texttildelow}

```

Finally those below are only available in CM-based fonts but in no font that has its origin outside of the T_EX world.

```

273 \DeclareTextCommandDefault{\textbaht}
274     {\tc@check@symbol2\textbaht}
275 \DeclareTextCommandDefault{\textbigcircle}
276     {\tc@check@symbol2\textbigcircle}
277 \DeclareTextCommandDefault{\textborn}
278     {\tc@check@symbol2\textborn}
279 \DeclareTextCommandDefault{\textcentoldstyle}
280     {\tc@check@symbol2\textcentoldstyle}
281 \DeclareTextCommandDefault{\textcircledP}
282     {\tc@check@symbol2\textcircledP}
283 \DeclareTextCommandDefault{\textcopleft}
284     {\tc@check@symbol2\textcopleft}
285 \DeclareTextCommandDefault{\textdblhyphenchar}
286     {\tc@check@symbol2\textdblhyphenchar}
287 \DeclareTextCommandDefault{\textdblhyphen}
288     {\tc@check@symbol2\textdblhyphen}
289 \DeclareTextCommandDefault{\textdied}
290     {\tc@check@symbol2\textdied}
291 \DeclareTextCommandDefault{\textdiscount}
292     {\tc@check@symbol2\textdiscount}
293 \DeclareTextCommandDefault{\textdivorced}
294     {\tc@check@symbol2\textdivorced}
295 \DeclareTextCommandDefault{\textdollaroldstyle}
296     {\tc@check@symbol2\textdollaroldstyle}
297 \DeclareTextCommandDefault{\textguarani}
298     {\tc@check@symbol2\textguarani}
299 \DeclareTextCommandDefault{\textleaf}
300     {\tc@check@symbol2\textleaf}
301 \DeclareTextCommandDefault{\textlquill}
302     {\tc@check@symbol2\textlquill}
303 \DeclareTextCommandDefault{\textmarried}
304     {\tc@check@symbol2\textmarried}
305 \DeclareTextCommandDefault{\textmho}
306     {\tc@check@symbol2\textmho}
307 \DeclareTextCommandDefault{\textmusicalnote}
308     {\tc@check@symbol2\textmusicalnote}
309 \DeclareTextCommandDefault{\textnaira}
310     {\tc@check@symbol2\textnaira}

```

```

311 \DeclareTextCommandDefault{\textopenbullet}
312         {\tc@check@symbol2\textopenbullet}
313 \DeclareTextCommandDefault{\textpeso}
314         {\tc@check@symbol2\textpeso}
315 \DeclareTextCommandDefault{\textpilcrow}
316         {\tc@check@symbol2\textpilcrow}
317 \DeclareTextCommandDefault{\textrecipe}
318         {\tc@check@symbol2\textrecipe}
319 \DeclareTextCommandDefault{\textreferencemark}
320         {\tc@check@symbol2\textreferencemark}
321 \DeclareTextCommandDefault{\textrquill}
322         {\tc@check@symbol2\textrquill}
323 \DeclareTextCommandDefault{\textservicemark}
324         {\tc@check@symbol2\textservicemark}
325 \DeclareTextCommandDefault{\textsurd}
326         {\tc@check@symbol2\textsurd}

```

The `\textpertenthousand` also belongs in this group but here we have a choice: in T1 there is a definition for `\textpertenthousand` making the symbol up from % and `\char 24` (twice) but in many fonts that char doesn't exist and the slot is reused for random ligatures. So better not use it because often it is wrong. But pointing to TS1 is also not great as only a few fonts have it as a real symbol, so we get a substitution to CM or LM.

Alternatively we could just state that the symbol is unavailable in those fonts. For now I substitute.

```

327 \DeclareTextCommandDefault{\textpertenthousand}
328         {\tc@check@symbol2\textpertenthousand}
329 \UndeclareTextCommand{\textpertenthousand}{T1}

```

1.3 Sub-encoding 3

Sub-encoding 2 is the one where we loose many symbols. In the higher-numbered sub-encodings we see only a few dropped additionally.

```

330 \DeclareTextCommandDefault{\textlangle}
331         {\tc@check@symbol3\textlangle}
332 \DeclareTextCommandDefault{\textrangle}
333         {\tc@check@symbol3\textrangle}

```

1.4 Sub-encoding 4

```

334 \DeclareTextCommandDefault{\textcolonmonetary}
335         {\tc@check@symbol4\textcolonmonetary}
336 \DeclareTextCommandDefault{\textdong}
337         {\tc@check@symbol4\textdong}
338 \DeclareTextCommandDefault{\textdownarrow}
339         {\tc@check@symbol4\textdownarrow}
340 \DeclareTextCommandDefault{\textleftarrow}
341         {\tc@check@symbol4\textleftarrow}
342 \DeclareTextCommandDefault{\textlira}
343         {\tc@check@symbol4\textlira}
344 \DeclareTextCommandDefault{\textrightarrow}
345         {\tc@check@symbol4\textrightarrow}
346 \DeclareTextCommandDefault{\textuparrow}
347         {\tc@check@symbol4\textuparrow}

```

```

348 \DeclareTextCommandDefault{\textwon}
349      {\tc@check@symbol4\textwon}

```

1.5 Sub-encoding 5 (most older PS fonts)

Most older PS fonts (supported in T_EX since the early nineties when virtual fonts became available) are sorted under this sub-encoding. But in reality, many of them don't have all glyphs that should be available in sub-encoding 5. Instead they show little squares, i.e., they produce “tofu” if you are unlucky.

But the coverage is so random that it is impossible to sort them properly and if we tried to ensure that they only typeset those glyphs that are really always available, we would have to put them all into sub-encoding 9; so putting them into 5 is really a compromise.

Modern fonts usually don't typeset a tofu character if a glyph is missing. They are therefore only classified as sub-encoding 5 if they really support its glyph set completely.

```

350 \DeclareTextCommandDefault{\textestimated}
351      {\tc@check@symbol5\textestimated}
352 \DeclareTextCommandDefault{\textnumero}
353      {\tc@check@symbol5\textnumero}

```

1.6 Sub-encoding 6

```

354 \DeclareTextCommandDefault{\textflorin}
355      {\tc@check@symbol6\textflorin}
356 \DeclareTextCommandDefault{\textcurrency}
357      {\tc@check@symbol6\textcurrency}

```

1.7 Sub-encoding 7

```

358 \DeclareTextCommandDefault{\textfractionsolidus}
359      {\tc@check@symbol7\textfractionsolidus}
360 \DeclareTextCommandDefault{\textohm}
361      {\tc@check@symbol7\textohm}
362 \DeclareTextCommandDefault{\textmu}
363      {\tc@check@symbol7\textmu}
364 \DeclareTextCommandDefault{\textminus}
365      {\tc@check@symbol7\textminus}

```

1.8 Sub-encoding 8

```

366 \DeclareTextCommandDefault{\textblank}
367      {\tc@check@symbol{8}\textblank}
368 \DeclareTextCommandDefault{\textinterrobangdown}
369      {\tc@check@symbol{8}\textinterrobangdown}
370 \DeclareTextCommandDefault{\textinterrobang}
371      {\tc@check@symbol{8}\textinterrobang}

```

Fonts with this sub-encoding don't have a Euro symbol, but instead of substituting we fake it.

```

372 \DeclareTextCommandDefault{\texteuro}
373      {\CheckEncodingSubset\UseTextSymbol{TS1}\tc@fake@euro{8}\texteuro}

```

1.9 Sub-encoding 9 (most missing)

```

374 \DeclareTextCommandDefault{\textcelsius}
375      {\tc@check@symbol{9}\textcelsius}

```

```

376 \DeclareTextCommandDefault{\textonesuperior}
377         {\tc@check@symbol{9}\textonesuperior}
378 \DeclareTextCommandDefault{\textthreequartersemdash}
379         {\tc@check@symbol{9}\textthreequartersemdash}
380 \DeclareTextCommandDefault{\textthreesuperior}
381         {\tc@check@symbol{9}\textthreesuperior}
382 \DeclareTextCommandDefault{\texttwelveudash}
383         {\tc@check@symbol{9}\texttwelveudash}
384 \DeclareTextCommandDefault{\texttwosuperior}
385         {\tc@check@symbol{9}\texttwosuperior}
386 \DeclareTextCommandDefault{\textbardbl}
387         {\tc@check@symbol{9}\textbardbl}

```

2 Unicode engine specials

If we are using a unicode engine we handle some glyphs differently, so this here are the definitions for the Unicode encoding (overwriting the defaults above).

```

388 \ifx \Umathcode\@undefined \else

```

This set should be taken from TS1 encoding even if it means you get it from the default font for that encoding.

```

389 %\DeclareTextSymbol{\textcopyleft}{TS1}{171}
390 %\DeclareTextSymbol{\textdblhyphen}{TS1}{45}
391 %\DeclareTextSymbol{\textdblhyphenchar}{TS1}{127}
392 %\DeclareTextSymbol{\textquotestraightbase}{TS1}{13}
393 %\DeclareTextSymbol{\textquotestraightdblbase}{TS1}{18}
394 %\DeclareTextSymbol{\textleaf}{TS1}{108}
395 %\DeclareTextSymbol{\texttwelveudash}{TS1}{21}
396 %\DeclareTextSymbol{\textthreequartersemdash}{TS1}{22}

```

If oldstyle numerals are asked for we just use \oldstylenums.

```

397 \DeclareTextCommand{\textzerooldstyle} \UnicodeEncodingName{\oldstylenums{0}}
398 \DeclareTextCommand{\textoneoldstyle} \UnicodeEncodingName{\oldstylenums{1}}
399 \DeclareTextCommand{\texttwooldstyle} \UnicodeEncodingName{\oldstylenums{2}}
400 \DeclareTextCommand{\textthreeoldstyle} \UnicodeEncodingName{\oldstylenums{3}}
401 \DeclareTextCommand{\textfouroldstyle} \UnicodeEncodingName{\oldstylenums{4}}
402 \DeclareTextCommand{\textfiveoldstyle} \UnicodeEncodingName{\oldstylenums{5}}
403 \DeclareTextCommand{\textsixoldstyle} \UnicodeEncodingName{\oldstylenums{6}}
404 \DeclareTextCommand{\textsevenoldstyle} \UnicodeEncodingName{\oldstylenums{7}}
405 \DeclareTextCommand{\texteightoldstyle} \UnicodeEncodingName{\oldstylenums{8}}
406 \DeclareTextCommand{\textnineoldstyle} \UnicodeEncodingName{\oldstylenums{9}}

```

These have Unicode slots so this should be integrated into TU explicitly

```

407 \DeclareTextSymbol{\textpilcrow} \UnicodeEncodingName{"00B6}
408 \DeclareTextSymbol{\textborn} \UnicodeEncodingName{"002A}
409 \DeclareTextSymbol{\textdied} \UnicodeEncodingName{"2020}
410 \DeclareTextSymbol{\textlbrackdbl} \UnicodeEncodingName{"27E6}
411 \DeclareTextSymbol{\textrbrackdbl} \UnicodeEncodingName{"27E7}
412 \DeclareTextSymbol{\textguarani} \UnicodeEncodingName{"20B2}

```

We could make \textcentoldstyle and \textdollaroldstyle point to dollar and cent in the Unicode encoding

```

413 %\DeclareTextSymbol{\textcentoldstyle} \UnicodeEncodingName{"00A2}
414 %\DeclareTextSymbol{\textdollaroldstyle} \UnicodeEncodingName{"0024}

```

but I think it is better to pick them up from TS1 even if that usually means LMR fonts

```

415 \DeclareTextSymbol{\textdollaroldstyle}{TS1}{138}
416 \DeclareTextSymbol{\textcentoldstyle}{TS1}{139}
417 \fi % --- END of Unicode engines specials

```

3 Font family sub-encodings setup

We declare the subsets for a good number of fonts in the kernel ...

But first the default for anything that is not declared. We use 9 which is most likely much too conservative, but with the advantage that we aren't getting missing glyphs (or at least that this is very unlikely). For nearly all font in the T_EX Live distribution of 2019 "correct" classifications are given below, so that this default is only used for new font families, and over time the right classifications can be added here too.

```

418 \DeclareEncodingSubset{TS1}{?}{9}

```

This first block contains the fonts that have been already supported by the `textcomp` package way back, i.e., the font families that have T_EX support since the mid-nineties.

```

419 \DeclareEncodingSubset{TS1}{ccr}{0}
420 \DeclareEncodingSubset{TS1}{cmbr}{0}
421 \DeclareEncodingSubset{TS1}{cmr}{0}
422 \DeclareEncodingSubset{TS1}{cmss}{0}
423 \DeclareEncodingSubset{TS1}{cmtl}{0}
424 \DeclareEncodingSubset{TS1}{cmtt}{0}
425 \DeclareEncodingSubset{TS1}{cmvtt}{0}

465 \DeclareEncodingSubset{TS1}{ul9} {5} % tofu for blank, interrobang/down, ohm

466 \DeclareEncodingSubset{TS1}{dayroms} {6} % tofu for blank, interrobang/down, ohm
467 \DeclareEncodingSubset{TS1}{dayrom} {6} % tofu for blank, interrobang/down, ohm

468 \DeclareEncodingSubset{TS1}{augie} {8} % really only missing euro
469 \DeclareEncodingSubset{TS1}{put} {8}
470 \DeclareEncodingSubset{TS1}{uag} {8} % probably (currently broken distrib)
471 \DeclareEncodingSubset{TS1}{ugq} {8}

472 \DeclareEncodingSubset{TS1}{zi4} {9}

```

LucidaBright (sold through TUG) probably not quite correct, I guess as I have the older fonts ...

```

473 \DeclareEncodingSubset{TS1}{hls} {5}
474 \DeclareEncodingSubset{TS1}{hlst} {5}
475 \DeclareEncodingSubset{TS1}{hlct} {5}
476 \DeclareEncodingSubset{TS1}{hlh} {5}
477 \DeclareEncodingSubset{TS1}{hlx} {8}
478 \DeclareEncodingSubset{TS1}{hlce} {8}
479 \DeclareEncodingSubset{TS1}{hlcn} {8}
480 \DeclareEncodingSubset{TS1}{hlcw} {8}
481 \DeclareEncodingSubset{TS1}{hlcf} {8}

```

Below are the newer fonts that have support files for L^AT_EX. With very few exceptions the classifications are done so that all characters are correctly produced (either being available in the font or substituted).

There are a few fonts that contain “tofu” squares in places (instead of a real glyph) and in a few cases some really seldom needed chars are unavailable, i.e., produce missing glyphs (to avoid that a large number of available chars are unnecessarily substituted).

```

482 \DeclareEncodingSubset{TS1}{lato-*} {0} % with a bunch of tofu inside
483 \DeclareEncodingSubset{TS1}{opensans-*} {0} % with a bunch of tofu inside

605   \DeclareTextSymbolDefault{\textsection}{OMS}%
606   \UndeclareTextCommand{\textsection}{T1}%
607   \expandafter\let\csname oldstylenums \expandafter\endcsname
608     \csname legacyoldstylenums \endcsname
609 }

```

(End definition for \UseLegacyTextSymbols.)

`\textlegacyasteriskcentered` Here are new names for the legacy symbols that L^AT_EX used to pick up from the OMS encoded fonts (and used for itemize lists or footnote symbols).

`\textlegacybardbl`

`\textlegacybullet`

`\textlegacydaggerdbl`

`\textlegacydagger`

`\textlegacyparagraph`

`\textlegacyperiodcentered`

`\textlegacysection`

We go the roundabout way via separate OMS declarations so that

```
\renewcommand\textbullet{\textlegacybullet}
```

doesn't produce an endless loop.

```

610 \DeclareTextSymbol{\textlegacyasteriskcentered}{OMS}{3} % "03
611 \DeclareTextSymbol{\textlegacybardbl}{OMS}{107} % "6B
612 \DeclareTextSymbol{\textlegacybullet}{OMS}{15} % "0F

5 The textcomp package

```

823 <*TS1sty>
824 \providecommand\DeclareRelease[3]{}
825 \providecommand\DeclareCurrentRelease[2]{}
826
827 \DeclareRelease{}{2018-08-11}{textcomp-2018-08-11.sty}
828 \DeclareCurrentRelease{}{2020-02-02}
829
830 \ProvidesPackage{textcomp}
831 [2020/02/02 v2.0n Standard LaTeX package]

```

A precaution in case this is used without rebuilding the format.

```

832 \NeedsTeXFormat{LaTeX2e}[2020/02/02]

```

This is implemented by defining the default subset:

```

833 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}
834 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}
835 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{8}}
836 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{9}}

```

The default is set up in the kernel is “safe” these days for unknown fonts but LaTeX has definitions for most families so it seldom applies.

If a different default is used then one needs to check the results to ensure that there aren’t “missing glyphs”.

The next set of options define the warning level (default in the kernel is info only). Using the package options you can change this behavior.

```

837 \DeclareOption{error}
838     {\gdef\tc@errorwarn{\PackageError{textcomp}}}
839 \DeclareOption{warn}
840     {\gdef\tc@errorwarn#1#2{\PackageWarning{textcomp}{#1}}}
841 \DeclareOption{info}
842     {\gdef\tc@errorwarn#1#2{\PackageInfo{textcomp}{#1}}}
843 \DeclareOption{quiet}{\gdef\tc@errorwarn#1#2{}}

```

The “force” option basically changes the sub-encoding to that of the default (which, unless changes, is 9 these days), i.e., it no longer depends on the font in use. This is mainly there because it might have been used in older documents, but not something that is recommended.

```

844 \DeclareOption{force}{%
845     \def\CheckEncodingSubset#1#2#3#4#5{%
846         \ifnum #4>%
847             0\csname #2:?\endcsname
848             \relax
849         \expandafter\@firstoftwo
850         \else
851         \expandafter\@secondoftwo
852         \fi
853         {#1{#2}}{#3}%
854         #5}%
855 }
856 \ExecuteOptions{info}
857 \ProcessOptions\relax

```

There is not much else to do nowadays, because everything is already set up in the L^AT_EX kernel.

```

858 \InputIfFileExists{textcomp.cfg}
859     {\PackageInfo{textcomp}{Local configuration file used}}{}
860 </TS1sty>

```

5.1 The old textcomp package code

This section contains the old code for the textcomp package and its documentation. It is only used if we roll back prior to 2020. Thus all the rest is mainly for historians. Note that the old code categorized in the sub-encodings only into 6 classes not 10.

```

861 <*TS1oldsty>
862 \ProvidesPackage{textcomp}
863     [2018/08/11 v2.0j Standard LaTeX package]

```

This one is for the TS1 encoding which contains text symbols for use with the T1-encoded text fonts. It therefore first inputs the file `TS1enc.def` and then sets (or resets) the defaults for the symbols it contains. The result of this is that when one of these symbols is accessed and the current encoding does not provide it, the symbol will be supplied by a silent, local change to this encoding.

Since many PostScript fonts only implement a subset of TS1 many commands only produce black blobs of ink. To resolve the resulting problems a number of options have been introduced and some code has been developed to distinguish sub-encodings.

The sub-encodings have a numerical id and are defined as follows for TS1:

#5 those TS1 symbols that are also in the ISO-Adobe character set; without `textcurrency`, which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

#4 = **#5** + `\texteuro`. Most newer fonts provide this.

#3 = **#4** + `\textomega`. Can also be described as $TS1 \cap (ISO-Adobe \cup MacRoman)$. (Except for the missing "currency".)

#2 = **#3** + `\textestimated` + `textcurrency`. Can also be described as $TS1 \cap Adobe-Western-2$. This may be relevant for OpenType fonts, which usually show the Adobe-Western-2 character set.

#1 = TS1 without `\textcircled` and `\t`. These two glyphs are often not implemented and if their kernel defaults are changed commands like `\copyright` unnecessarily fail.

#0 = full TS1

And here a summary to go in the transcript file:

```

864 \PackageInfo{textcomp}{Sub-encoding information:\MessageBreak
865   \space\space 5 = only ISO-Adobe without
866                               \string\textcurrency\MessageBreak
867   \space\space 4 = 5 + \string\texteuro\MessageBreak
868   \space\space 3 = 4 + \string\textohm\MessageBreak
869   \space\space 2 = 3 + \noexpand\textestimated+
870                               \string\textcurrency\MessageBreak
871   \space\space 1 = TS1 - \noexpand\textcircled-
872                               \string\t\MessageBreak
873   \space\space 0 = TS1 (full)\MessageBreak
874   Font families with sub-encoding setting implement\MessageBreak
875   only a restricted character set as indicated.\MessageBreak
876   Family '?' is the default used for unknown fonts.\MessageBreak
877   See the documentation for details\@gobble}

```

`\DeclareEncodingSubset` An encoding subset to which a font family belongs is declared by the command `\DeclareEncodingSubset` that takes the major encoding as the first argument (e.g., TS1), the family name as the second argument (e.g., `cmr`), and the subset encoding id as a third, (e.g., 0 for `cmr`).

The default encoding subset to use when nothing is known about the current font family is named `?`.

```

878 \def\DeclareEncodingSubset#1#2#3{%
879   \@ifundefined{#1:#2}%
880     {\PackageInfo{textcomp}{Setting #2 sub-encoding to #1/#3}}%
881     {\PackageInfo{textcomp}{Changing #2 sub-encoding to #1/#3}}%
882   \@namedef{#1:#2}{#3}}
883 \@onlypreamble\DeclareEncodingSubset

```

(End definition for `\DeclareEncodingSubset`.)

The options for the package are the following:

safe for unknown font families enables only symbols that are also in the ISO-Adobe character set; without "currency", which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

euro enables the “safe” symbols plus the `\texteuro` command. Most newer fonts provide this.

full enables all TS1 commands; useful only with fonts like EC or CM bright.

almostfull same as “full”, except that `\textcircled` and `\t` are *not* redefined from their defaults to avoid that commands like `\copyright` suddenly no longer work.

force ignore all subset encoding definitions stored in the package itself or in the configuration file and always use the default subset as specified by one of the other options (seldom useful, only dangerous).

`\iftc@forced` Switch used to implement the **force** option

```
884 \newif\iftc@forced \tc@forcedfalse
```

(End definition for `\iftc@forced`.)

This is implemented by defining the default subset:

```
885 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}
886 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}
887 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{4}}
888 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{5}}
```

The default is “almostfull” which means that old documents will work except that `\textcircled` and `\t` will use the kernel defaults (with the advantage that this also works if the current font (as often the case) doesn’t implement these glyphs.

The “force” option simply sets the switch to true.

```
889 \DeclareOption{force}{\tc@forcedtrue}
```

The suggestions to user is to use the “safe” option always unless that balks in which case they could switch to “almostfull” but then better check their output manually.

```
890 \def\tc@errorwarn{\PackageError}
891 \DeclareOption{warn}{\gdef\tc@errorwarn#1#2#3{\PackageWarning{#1}{#2}}}
892 \DeclareOption{quiet}{\gdef\tc@errorwarn#1#2#3{}}
893 \ExecuteOptions{almostfull}
894 \ProcessOptions\relax
```

`\CheckEncodingSubset` The command `\CheckEncodingSubset` will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either `\UseTextSymbol`, `\UseTextAccent` depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: `#2` and `#5` of `\CheckEncodingSubset`.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute `#1{#2}#5` otherwise it runs `#3#5`, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

```
895 \iftc@forced
```

If the “force” option was given we always use the default for testing against.

```

896 \def\CheckEncodingSubset#1#2#3#4#5{%
897     \ifnum #4>%
898         0\csname #2:\endcsname
899         \relax
900     \expandafter\@firstoftwo
901 \else
902     \expandafter\@secondoftwo
903 \fi
904     {#1{#2}}{#3}%
905     #5%
906 }
```

In normal circumstances the test is a bit more complicated: first check if there exists a macro `\langle arg2\rangle: \langle current-family\rangle` and if so use that value to test against, otherwise use the default to test against.

```

907 \else
908 \def\CheckEncodingSubset#1#2#3#4#5{%
909     \ifnum #4>%
910         \expandafter\ifx\csname #2:\f@family\endcsname\relax
911         0\csname #2:\endcsname
912         \else
913         \csname #2:\f@family\endcsname
914         \fi
915         \relax
916     \expandafter\@firstoftwo
917 \else
918     \expandafter\@secondoftwo
919 \fi
920     {#1{#2}}{#3}%
921     #5%
922 }
923 \fi
```

(End definition for `\CheckEncodingSubset`.)

`\tc@subst`

```

924 \def\tc@subst#1{%
925     \tc@errorwarn{textcomp}%
926     {Symbol \string#1 not provided by\MessageBreak
927     font family \f@family\space
928     in TS1 encoding.\MessageBreak Default family used instead}\@eha
929     \bgroup\fontfamily\textcompssubstdefault\selectfont#1\egroup
930 }
```

(End definition for `\tc@subst`.)

`\tc@error` `\tc@error` is going to be used in arg #3 of `\CheckEncodingSubset` when a symbol is not available in a certain font family. It gets pass the encoding it normally lives in (arg one) and the name of the symbol or accent that has a problem.

```

931 % error commands take argument:
932 % #1 symbol to be used
933 \def\tc@error#1{%
934     \PackageError{textcomp}% % should be latex error if general
```

```

935 {Accent \string#1 not provided by\MessageBreak
936 font family \f@family\space
937 in TS1 encoding}\@eha
938 }

```

(End definition for \tc@error.)

\tc@fake@euro \tc@fake@euro is an example of a “fake” definition to use in arg #3 of \CheckEncodingSubset when a symbol is not available in a certain font family. Here we produce an Euro symbol by combining a “C” with a “=”.

```

939 \def\tc@fake@euro#1{%
940   \leavevmode
941   \PackageInfo{textcomp}{Faking \noexpand#1for font family
942                                     \f@family\MessageBreak in TS1 encoding}%
943   \valign{##\cr
944     \vfil\hbox to 0.07em{\dimen@\f@size\p@
945                                     \math@fontsfalse
946                                     \fontsize{.7\dimen@}\z@\selectfont=\hss}%
947     \vfil\cr%
948     \hbox{C}\crrcr
949   }%
950 }

```

(End definition for \tc@fake@euro.)

\tc@check@symbol These are two abbreviations that we use below to check symbols and accents in TS1.
\tc@check@accent Only there to save some space, e.g., we can then write

```

DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}

```

to ensure that \textcurrency is only typeset if the current font has a TS1 subset id of less than 3. Otherwise \tc@error is called telling the user that for this font family \textcurrency is not available.

```

951 \def\tc@check@symbol{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@subst}
952 \def\tc@check@accent{\CheckEncodingSubset\UseTextAccent{TS1}\tc@error}

```

(End definition for \tc@check@symbol and \tc@check@accent.)

We start with the commands that are “safe” and which can be unconditionally set up, first the accents...

```

1134 \DeclareTextCommandDefault{\textsurd}%
1135     {\tc@check@symbol2\textsurd}

```

The `\textcircled` and `\t` are handled specially, unless the current font has a subset id of 0 (i.e. full TS1) we pick the symbols up from the math font encodings, i.e., the third argument to `\CheckEncodingSubset` uses `\UseTextAccent` to get them from there.

```

1136 \DeclareTextCommandDefault{\textcircled}
1137     {\CheckEncodingSubset\UseTextAccent{TS1}%
1138     {\UseTextAccent{OMS}}1\textcircled}
1139 \DeclareTextCommandDefault{\t}
1140     {\CheckEncodingSubset\UseTextAccent{TS1}%
1141     {\UseTextAccent{OML}}1\t}

```

Finally input the encoding-specific definitions for TS1 thus making the top-level definitions optimized for this encoding (and not for the default encoding).

```

1142 \input{ts1enc.def}

```

Now having the new glyphs available we also want to make sure that they are used. For most cases this will automatically happen but for some glyphs there are inferior definitions already known to L^AT_EX which will prevent the usage of the TS1 versions. So we better get rid of them:

```

1143 \UndeclareTextCommand{\textsterling}{OT1}
1144 \UndeclareTextCommand{\textdollar} {OT1}

```

Similar declarations should probably be made for other encodings like OT4 if they are in use.

```

1145 %\UndeclareTextCommand{\textsterling}{OT4}
1146 %\UndeclareTextCommand{\textdollar} {OT4}

```

From the T1 encoding there are two candidates for removal: `%00` and `%000` since these are both constructed from `%` followed by a tiny ‘o’ rather than being a single glyph. The problem with this approach is that in PostScript fonts this small zero is usually not available resulting in `%0` rather than `%00` while the real glyph (at least for `\textperthousand`) is available in the PostScript version of TS1. So for the moment we compromise by removing the T1 declaration for `\textperthousand` but keeping the one for `\textpertenthousand`. This will have the effect that with Computer Modern fonts everything will come out (although `%00` and `%000` are not taken from the same physical font) and with PostScript fonts `%00` will come out correctly while `%000` will most likely look like `%0■` — which is probably an

improvement over just getting a single ‘■’ to indicate a completely missing glyph, which would happen if we also ‘undeclared’ `\textpertenthousand`.

```
1147 \UndeclareTextCommand{\textperthousand}{T1}
1148 %\UndeclareTextCommand{\textpertenthousand}{T1}
```

5.1.1 Supporting oldstyle digits

```
1149 \DeclareRobustCommand\oldstylenums[1]{%
1150   \begingroup
1151   \ifmmode
1152     \mathgroup\symletters #1%
1153   \else
1154     \CheckEncodingSubset\@use@text@encoding{TS1}%
1155     {\PackageWarning{textcomp}%
1156      {Oldstyle digits unavailable for
1157       family \f@family.\MessageBreak
1158       Lining digits used instead}}%
1159     \tw@{#1}%
1160   \fi
1161 \endgroup
1162 }
```

5.1.2 Subset encoding defaults

For many font families commonly used in the T_EX world we provide the subset encoding data here. Users can add additional font families in the file `textcomp.cfg` if they own other fonts.

However, if the option “forced” was given then all subset encoding specifications are ignored, so there is no point in setting any of them up:

```
1163 \iftc@forced \else
```

Computer modern based fonts (e.g., CM, CM-Bright, Concrete):

```
1164 \DeclareEncodingSubset{TS1}{cmr}      {0}
1165 \DeclareEncodingSubset{TS1}{cmss}     {0}
1166 \DeclareEncodingSubset{TS1}{cmtt}     {0}
1167 \DeclareEncodingSubset{TS1}{cmvtt}    {0}

1223 \DeclareEncodingSubset{TS1}{ptmx}      {4}
1224 \DeclareEncodingSubset{TS1}{ptmj}      {4}

```

If the file `textcomp.cfg` exists it will be loaded at this point. This allows to define further subset encodings for font families not covered by default.

```
1225 \InputIfFileExists{textcomp.cfg}
1226   {\PackageInfo{textcomp}{Local configuration file used}}{}
1227 \fi
1228 \
```

File C

ltpageno.dtx

1 Page Numbering

Page numbers are produced by a page counter, used just like any other counter. The only difference is that `\c@page` contains the number of the next page to be output (the one currently being produced), rather than one minus it. Thus, it is normally initialized to 1 rather than 0. `\c@page` is defined to be `\count0`, rather than a count assigned by `\newcount`.

`\pagenumbering` The user sets the page number style with the `\pagenumbering{<foo>}` command, which sets the page counter to 1 and defines `\thepage` to be `\foo`. For example, `\pagenumbering{roman}` causes pages to be numbered i, ii, etc.

```
1 <*2ekernel>
2 \message{page nos.,}

3 \countdef\c@page=0 \c@page=1
4 \def\c1@page{}
5 \def\pagenumbering#1{%
6   \global\c@page \c@one \gdef\thepage{\csname @#1\endcsname
7     \c@page}}
8 </2ekernel>
```

File D

ltxref.dtx

1 Cross Referencing

The user writes `\label{foo}` to define the following cross-references:

`\ref{foo}`: value of most recently incremented referenceable counter. in the current environment. (Chapter, section, theorem and enumeration counters are referenceable, footnote counters are not.)

`\pageref{foo}`: page number at which `\label{foo}` command appeared. where foo can be any string of characters not containing `\`, `{` or `}`.

Note: The scope of the `\label` command is delimited by environments, so `\begin{theorem} \label{foo} ... \end{theorem} \label{bar}` defines `\ref{foo}` to be the theorem number and `\ref{bar}` to be the current section number.

Note: `\label` does the right thing in terms of spacing – i.e., leaving a space on both sides of it is equivalent to leaving a space on either side.

1.1 Cross Referencing

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
1 \<*2ekernel)
2 \message{x-ref,}
```

This is implemented as follows. A referenceable counter CNT is incremented by the command `\refstepcounter{CNT}`, which sets `\@currentlabel == {CNT}{eval(\p@cnt\theCNT)}`. The command `\label{FOO}` then writes the following on file `\@auxout`:

```
\newlabel{FOO}{{eval(\@currentlabel)}{eval(\thepage)}}
```

```
\ref{FOO} ==
BEGIN
  if \r@foo undefined
  then  @refundefined := G T
        ??
        Warning: 'reference foo on page ... undefined'
  else  \@car \eval(\r@FOO)\@nil
  fi
END
```

```
\pageref{foo} =
BEGIN
  if \r@foo undefined
  then  @refundefined := G T
        ??
        Warning: 'reference foo on page ... undefined'
  else  \@cdr \eval(\r@FOO)\@nil
  fi
END
```

End of historical L^AT_EX 2.09 comments.

`\labelformat`

A reference via `\ref` produces by default the data associated with the corresponding `\label` command (typically a number); any additional formatting has to be provided by the user. If, for example, references to equations are always to be typeset as “equation (*number*)”, one has to code “`equation (\ref{key})`”. With `\labelformat` there is a possibility to generate such frills automatically without resorting to low-level coding. The command takes two arguments: the first is the name of a counter and the second is its representation when referenced. This means that for a successful usage, one has to know the counter name being used for generating the label, though in practice this should not pose a problem. The current counter number is picked up as an argument. Here are two examples:

```
\labelformat{section}{section-#1}
\labelformat{equation}{equation~( #1 )}
```

`\Ref`

A side effect of using `\labelformat` is that, depending on the defined formatting, it becomes impossible to use `\ref` at the beginning of a sentence (if its replacement text starts with a lowercase letter). To overcome this problem we introduce the command `\Ref` that behave like `\ref` except that it uppercases the first token of the generated string.

To make `\Ref` work properly the very first token in the second argument of `\labelformat` has to be a simple ASCII or UTF-8 letter, otherwise the capitalization will fail or worse, you will end up with some error messages. If you actually need something more complicated in this place (e.g., an accented letter not written as a UTF-8 character) you have to explicitly surround it with braces, to identify the part that needs to be capitalized. For example, for figure references in the Hungarian language you might want to write `\labelformat{figure}{\ 'a}bra~\thefigure}` or use `\labelformat{figure}{ábra~\thefigure}` which avoids the brace problem.

`\G@refundefinedtrue`
`\@refundefined`

This does not save on name-space (since `\G@refundefinedfalse` was never needed) but it does make the implementation of such one-way switches more consistent. The extra macro to make the change is used since this change appears several times.

Note despite its name, `\G@refundefinedtrue` does *not* correspond to an `\if` command, and there is no matching `...false`. It would be more natural to call the command `\G@refundefined` (as inspection of the change log will reveal) but unfortunately such a change would break any package that had defined a `\ref`-like command that mimicked the definition of `\ref`, calling `\G@refundefinedtrue`. Inspection of the T_EX archives revealed several such packages, and so this command has been named `...true` so that the definition of `\ref` need not be changed, and the packages will work without change.

```
3 % \newif\ifG@refundefined
4 % \def\G@refundefinedtrue{\global\let\ifG@refundefined\iftrue}
5 % \def\G@refundefinedfalse{\global\let\ifG@refundefined\iffalse}
6 \def\G@refundefinedtrue{%
7   \gdef\@refundefined{%
8     \@latex@warning@no@line{There were undefined references}}
9 \let\@refundefined\relax
```

(End definition for \G@refundefinedtrue and \@refundefined.)

`\ref` Referencing a `\label`. RmS 91/10/25: added a few extra `\reset@font`, as suggested by
`\pageref` Bernd Raichle
`\setref` RmS 92/08/14: made `\ref` and `\pageref` robust
RmS 93/09/08: Added setting of redefined switch.

```

10 \def\@setref#1#2#3{%
11   \ifx#1\relax
12     \protect\G@refundefinedtrue
13     \nfss@text{\reset@font\bfseries ??}%
14     \@latex@warning{Reference ‘#3’ on page \thepage \space
15       undefined}%
16   \else
17     \expandafter#2#1\relax
18   \fi}
19 \def\ref#1{\expandafter\@setref\csname r@#1\endcsname\@firstoftwo{#1}}
20 \def\pageref#1{\expandafter\@setref\csname r@#1\endcsname
21   \@secondoftwo{#1}}

```

(End definition for `\ref`, `\pageref`, and `\@setref`.)

`\newlabel` This command will be written to the `.aux` file to pass label information from one run to another.

The internal form of `\newlabel` and `\bibcite`. Note that this macro does its work inside a group. That way the local assignments it needs to do don't clutter the save stack. This prevents large documents with many labels to run out of save stack.

```

22 \def\@newl@bel#1#2#3{%
23   \@ifundefined{#1@#2}%
24     \relax
25     {\gdef \@multiplelabels {%
26       \@latex@warning@no@line{There were multiply-defined labels}}%
27       \@latex@warning@no@line{Label ‘#2’ multiply defined}}%
28   \global\@namedef{#1@#2}{#3}}
29 \def\newlabel{\@newl@bel r}
30 \@onlypreamble\@newl@bel

```

(End definition for `\newlabel` and `\@newl@bel`.)

`\if@multiplelabels` This is redefined to produce a warning if at least one label is defined more than once. It
`\@multiplelabels` is executed by the `\enddocument` command.

```

31 \let \@multiplelabels \relax

```

(End definition for `\if@multiplelabels` and `\@multiplelabels`.)

`\label` The commands `\label` and `\refstepcounter` have been changed to allow `\protect`'ed commands to work properly. For example,

```

\def\thechapter{\protect\foo{\arabic{chapter}.\roman{section}}}

```

will cause a `\label{bar}` command to define `\ref{bar}` to expand to something like `\foo{4.d}`. Change made 20 Jul 88.

```

32 \def\label#1{\@bsphack
33   \protected@write\@auxout{%
34     {\string\newlabel{#1}{\@currentlabel}\thepage}}%
35   \@esphack}

```

(End definition for \label.)

```
36 </2ekernel>
37 <*2ekernel | latexrelease>
38 <latexrelease>\IncludeInRelease{2020/10/01}%
39 <latexrelease>          {\refstepcounter}{Add \@currentcounter}%
```

\refstepcounter Step the counter and allow for labels to point to its current value.

```
40 \def\@currentcounter{}
41 \def\refstepcounter#1{\stepcounter{#1}%
42   \edef\@currentcounter{#1}%
43   \protected@edef\@currentlabel
```

By generating the second csname first the `\p@...` command can grab it as an argument which can be helpful for more complicated typesetting arrangements.

The trick is to ensure that `\csname the#1\endcsname` is turned into a single token before `\p@...` is expanded further. This way, if the `\p@...` command is a macro with one argument it will receive `\the...`. With the original kernel code (i.e., without the `\expandafter`) it will instead pick up `\csname` which would be disastrous.

Using `\expandafter` instead of braces delimiting the argument is better because, assuming that the `\p@...` command is not defined as a macro with one argument, the braces will stay and prohibit kerning that might otherwise happen between the glyphs generated by `\the...` and surrounding glyphs.

```
44   {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
45 }
```

(End definition for \refstepcounter.)

\labelformat A shortcut to set the `\p@...` macro for a counter. It will pick up the counter representation as an argument so that it can be specially formatted.

```
46 \def\labelformat#1{\expandafter\def\csname p@#1\endcsname##1}
```

(End definition for \labelformat.)

\Ref This macro expands the result of `\ref` and then uppercases the first token. Only useful if the label was generated via `\labelformat` and contains some lower case letter at its start. If the label starts with a complicated construct (e.g., an accented letter that is provided via a command, e.g., `\"a` instead of a UTF-8 character like `ä`) one has to surround everything that needs uppercasing in a brace group in the definition of `\labelformat`.¹⁸

```
47 \DeclareRobustCommand\Ref[1]{\protected@edef\@tempa{\ref{#1}}%
48   \expandafter\MakeUppercase\@tempa}
```

(End definition for \Ref.)

```
49 </2ekernel | latexrelease>
50 <latexrelease>\EndIncludeInRelease
51 <latexrelease>\IncludeInRelease{2019/10/01}%
52 <latexrelease>          {\refstepcounter}{Add \labelformat and \Ref}%
53 <latexrelease>\let\@currentcounter\@undefined
54 <latexrelease>\def\refstepcounter#1{\stepcounter{#1}%
55 <latexrelease>   \protected@edef\@currentlabel
```

¹⁸There is one problem with this approach: the braces are kept in a normal `\ref` which might spoil kerning. Perhaps one day this needs redoing.

```

56 <latexrelease>      {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
57 <latexrelease>}
58 <latexrelease>\def\labelformat#1{\expandafter\def\csname p@#1\endcsname##1}
59 <latexrelease>\DeclareRobustCommand\Ref[1]{\protected@edef\@tempa{\ref{#1}}}%
60 <latexrelease>      \expandafter\MakeUppercase\@tempa}
61 <latexrelease>\EndIncludeInRelease
62 <latexrelease>\IncludeInRelease{0000/00/00}%
63 <latexrelease>      {\refstepcounter}{Add \labelformat and \Ref}%
64 <latexrelease>
65 <latexrelease>\def\refstepcounter#1{\stepcounter{#1}%
66 <latexrelease>      \protected@edef\@currentlabel
67 <latexrelease>      {\csname p@#1\endcsname\csname the#1\endcsname}}%
68 <latexrelease>}
69 <latexrelease>\let\labelformat\@undefined
70 <latexrelease>\let\Ref\@undefined
71 <latexrelease>
72 <latexrelease>\EndIncludeInRelease
73 <*2ekernel>

```

`\@currentlabel` Default for `\label` commands that come before any environment.

```

74 \def\@currentlabel{}

```

(End definition for \@currentlabel.)

```

75 </2ekernel>

```

ltmiscen.dtx

1 Miscellaneous Environments

This section implements the basic environment mechanism, and also a few specific environments including `document`, The math environments and related commands, the ‘flushing’ environments, (`center`, `flushleft`, `flushright`), and `verbatim`.

```
1 \*2ekernel)
2 \message{environments,}
```

1.1 Environments

`\begin{foo}` and `\end{foo}` are used to delimit environment `foo`.

`\begin{foo}` starts a group and calls `\foo` if it is defined, otherwise it does nothing.

`\end{foo}` checks to see that it matches the corresponding `\begin` and if so, it calls `\endfoo` and does an `\endgroup`. Otherwise, `\end{foo}` does nothing.

If `\end{foo}` needs to ignore blanks after it, then `\endfoo` should globally set the `@ignore` switch true with `\@ignoretrue` (this will automatically be global).

NOTE: `\@@end` is defined to be the `\end` command of $\mathrm{T}_{\mathrm{E}}\mathrm{X}82$.

`\enddocument` is the user’s command for ending the manuscript file.

`\stop` is a panic button — to end $\mathrm{T}_{\mathrm{E}}\mathrm{X}$ in the middle.

Historical $\mathrm{L}^{\mathrm{A}}\mathrm{T}_{\mathrm{E}}\mathrm{X} 2.09$ comments (not necessarily accurate any more):

42 \ifdim \font@submax >\fontsubfuzz\relax

```

In case you wonder about the `\@gobbletwo` inside the message below, this is a horrible hack to remove the tokens `\on@line`. that are added by `\@font@warning` at the end.

```

43 \font@warning{Size substitutions with differences\MessageBreak
44             up to \font@submax\space have occurred.\@gobbletwo}%
45 \fi

```

The macro `\@defaultsubs` is initially `\relax` but gets redefined to produce a warning if there have been some default font substitutions.

```
46 \@@defaultsubs
```

The macro `\@refundefined` is initially `\relax` but gets redefined to produce a warning if there are undefined refs.

```
47 \@@refundefined
```

If a label is defined more than once, `\@tempswa` will always be true and thus produce a “Label(s) may ...” warning. But since a rerun will not solve that problem (unless one uses a package like `varioref` that generates labels on the fly), we suppress this message.

```
48 \if@filesw
49   \ifx \@multiplelabels \relax
50     \if@tempswa
51       \@latex@warning@no@line{Label(s) may have changed.
52         Rerun to get cross-references right}%
53     \fi
54   \else
55     \@multiplelabels
56   \fi
57   \ifx \@extra@page@added \relax
58     \@latex@warning@no@line{Temporary extra page added at the end.
59       Rerun to get it removed}%
60   \fi
```

We could think of adding a warning that nothing can be corrected while `\nofiles` is in force. In the past the warnings related to the aux file are simply suppressed in this case.

```
61 \fi
62 }
```

(End definition for `\@enddocument@kernel@warnings.`)

`\@testdef`

```

119 \def\@testdef #1#2#3{%
120 \def\reserved@a{#3}\expandafter \ifx \cename #1@#2\endcsname
121 \reserved@a \else \@tempwattrue \fi}

```

(End definition for \@testdef.)

Reading data from auxiliary files (like `.toc` normally happens in vertical mode and it therefore doesn't matter if line endings are converted to spaces by \TeX during that process.

However, especially the `.toc` file might be read in L-R mode (in cases the `\tableofcontents` attempts to put, say a list of sub-sections as a paragraph. In that case the newlines after a line like

`\contentsline {subsubsection}{\numberline {1.1.1}A C-head}{2}`

might result in spurious spaces (e.g., when that level is not included).

That could be fixed by reading in the file using `\endlinechar=-1` but that has the danger that it drops some valid endlines that should be converted to spaces (for example when the user edited the TOC and then used `\nofiles` to preserve it).

So the approach taken instead is this:

- `\addcontentsline` adds the command `\protected@file@percent` to the end of the second argument of `\@writefile` that is written to the `.aux`. As the name indicates this is a protected macro so it doesn't change if it is written out.
- When the `.aux` is read back in at the end of the run, `\@writefile` is executed and writes its second argument unmodified to the file with the extension given by its first argument. Or rather that was how it was in the past.
- Instead we change `\@writefile` slightly: basically it looks at the second argument and if the last token in there is `\protected@file@percent` then it is replaced by a percent character and that is then written out. If not (for example, if the data came from a user issued `\addtocontents`, or from some package that uses `\@writefile` for writing its own files) then the command behaves exactly as before.

`\protected@file@percent` Dummy cs to be replaced by a percent sign inside `\@writefile`. If it survives (when used incorrectly) it will expand to nothing in a typesetting context.

```

122 </2ekernel>
123 <*2ekernel | latexrelease>
124 <latexrelease>\IncludeInRelease{2018/12/01}%
125 <latexrelease>          {\protected@file@percent}{Mask line endings}%
126 \protected\def\protected@file@percent{}

```

(End definition for \protected@file@percent.)

`\add@percent@to@temptokena` Helper function which is used to inspect a sequence of tokens (the second argument of `\@writefile` and if the last token is `\protected@file@percent` it will replace it by a harmless percent. The result is saved in `\@temptokena` for later use.

```

127 \catcode'\^^A=9
128 \long\gdef\add@percent@to@temptokena
129   #1\protected@file@percent#2\add@percent@to@temptokena

```

When we call this macro in `\@writefile` we stick in `\@empty` at the beginning, so that in case the tokenlist consists of a single brace group the braces aren't stripped. The `\expandafter` then expands this extra token away again.

```

130   {\expandafter\ifx\expandafter X\detokenize{#2}X\expandafter\dont@add@percent@to@temptokena
131     \expandafter\do@add@percent@to@temptokena\fi{#1}}
132 \long\def\dont@add@percent@to@temptokena#1{%
133   \@temptokena\expandafter{#1}}

```

`latexrelease` will read this code in high-speed mode in certain situations. During that it will only look for `\if` tests but not actually execute the `\catcode` change above. As a result it will drop anything after the `%` character in the definition. Therefore the `\fi` needs to be on the next line and we need locally another comment character to avoid getting spaces into the definition—a weird problem :-)

```

134 \begingroup

```

```

135 \catcode'\%=12

233 <latexrelease> \csname #1\endcsname}}%
234 <latexrelease> \@ignorefalse
235 <latexrelease> \begingroup\@endpfalse\reserved@a}

```

A version that doesn't start out with `\relax` when in typesetting mode would be the following, but since `\begin` issues a `\begingroup` it wouldn't help much with respect to allowing things like `\noalign` or `\multicolumn` inside.

```

236 %\edef\begin
237 % {\unexpanded{%
238 % \ifx\protect\@typeset@protect
239 % \expandafter\@gobble
240 % \fi
241 % \protect
242 % }%
243 % \expandafter\noexpand\csname begin \endcsname
244 % }
245 %\@namedef{begin }#1{%
246 % \ifundefined{#1}%
247 % {\def\reserved@a{\@latex@error{Environment #1 undefined}\@eha}}%
248 % {\def\reserved@a{\def\@currentvir{#1}%
249 % \edef\@currentvline{\on@line}%
250 % \csname #1\endcsname}}%
251 % \@ignorefalse
252 % \begingroup\@endpfalse\reserved@a}

```

While `\begin` was made robust simply by using `\DeclareRobustCommand` we need to be a bit more subtle with `\end` as there are packages out there that try to look into the top-level contents of `\end{foo}` (that is at the expansion of `\endfoo`) to see if it contains certain macros. This is done by hitting `\end{foo}` with three `\expandafters`, the first to get

```
\csname endfoo\endcsname \quad \@checkend{foo}% etc.
```

the second to expand the `\csname`, i.e., to get to

```
\endfoo                                \@checkend{foo}% etc.
```

and the third to finally get to the top-level content of `\endfoo`, i.e.

```
<top-level content of \endfoo> \@checkend{foo}% etc.
```

Therefore a robust replacement should produce the same results after three expansions (there first is obviously different).

Basically the definition of `\end` should either produce `\protect\end_` (when not doing typesetting) or it should produce `\end_` (without the `\protect`) when doing typesetting. Furthermore, it should (when in typesetting mode) show exactly the same result as `\end_` (which is the original fragile definition of `\end`) when you expand either of them twice, i.e.,

```
\endfoo                                \@checkend{foo}% etc.
```

That is achieved with the code below (which is worth studying carefully).

There is some trickery involved here: in particular we use `\romannumeral` to change a single expansion into three successive expansions in one go. That primitive expands until it has scanned a number (0 in this case, so it doesn't produce any output) and so it allows us to place arbitrary many `\expandafters` inside that are all going to be executed when `\romannumeral` is hit by a single `\expandafter`.

```
253 <latexrelease>\edef\end
254 <latexrelease>  {\unexpanded{%
255 <latexrelease>    \romannumeral
256 <latexrelease>    \ifx\protect\@typeset@protect
257 <latexrelease>    \expandafter      %1
258 <latexrelease>    \expandafter      %2
259 <latexrelease>    \expandafter      %1
260 <latexrelease>    \expandafter      %3 expands the \cename inside \end<space>
261 <latexrelease>    \expandafter      %1
262 <latexrelease>    \expandafter      %2 expands \end<space>
263 <latexrelease>    \expandafter      %1 expands the \else
264 <latexrelease>    \z@
265 <latexrelease>    \else

```

They invoke the `trivlist` environment to handle vertical spacing before and after them.

`\centering`, `\raggedright` and `\raggedleft` are the declaration analogs of the above.

`\raggedright` has a more universal effect, however. It sets `\@rightskip := flushglue`. Every environment, like the list environments, that set `\rightskip` to its 'normal' value set it to `\@rightskip`

End of historical *L^AT_EX* 2.09 comments.

1.3 Verbatim

405 \message{verbatim,}

The verbatim environment uses the fixed-width `\ttfamily` font, turns blanks into spaces, starts a new line for each carriage return (or sequence of consecutive carriage returns), and interprets *every* character literally. I.e., all special characters `\`, `{`, `$`, etc. are `\catcode'd` to 'other'.

The command `\verb` produces in-line verbatim text, where the argument is delimited by any pair of characters. E.g., `\verb #...#` takes '...' as its argument, and sets it verbatim in `\ttfamily` font.

The *-variants of these commands are the same, except that spaces print as the TeXbook's space character instead of as blank spaces.

`\@vobeyspaces`

406 {\catcode'\ =\active%
407 \gdef\@vobeyspaces{\catcode'\ \active\let \@xobeysp}}

465 \ifx\kernel\includeinrelease
    {\verbvisiblespace}{Setup visible space for \verb}%
```

\asciispace The character in slot 32, in typewriter fonts (historically) a visible space but in other fonts a real space or something else

```
466 \DeclareRobustCommand\asciispace{\char 32 }
```

(End definition for \asciispace.)

\verbvisiblespace This defines how to get a visible space in **\verb*** and friends. In classic T_EX this is just the slot 32, but in T_U encoded fonts we switch fonts and take the character from cmtt.

```
467 \ifx\Umathcode\undefined
468   \let\verbvisiblespace\asciispace % Pdftex version
469 \else
470   \DeclareRobustCommand\verbvisiblespace
471     {\leavevmode{\usefont{OT1}{cmtt}{m}{n}\asciispace}} % xetex/luatex version
472 \fi
```

(End definition for \verbvisiblespace.)

\@setupverbvisiblespace In pdfT_EX a catcode 12 space will produce the character in slot 32 which is assumed to be a visible space character (in a typewriter font in OT1 or T1 encoding). In XeT_EX or LuaT_EX a font in T_U encoding is normally used and that has a real space in this slot. So what we do in this case is this: we check the definition of **\verbvisiblespace** and if it is **\asciispace** we assume that the char32 can be used (e.g., in pdfT_EX). We then redefine **\@xobeysp** so that after running **\@xobeyspaces** we get characters from slot 32 for each active space.

```
473 \def\@setupverbvisiblespace{%
474   \ifx\verbvisiblespace\asciispace
475     \let\@xobeysp\asciispace
476   \else
```

Otherwise we measure the width of a character in the mon-spaced current font and place a **\verbvisiblespace** into a box of the right width which we are then using as the character for a space. By default this will be the space character from OT1 cmtt but by changing **\verbvisiblespace** one could use, for example, the **\textvisiblespace** of the current typewriter font.

```
477   \setbox\z@\hbox{x}%
478   \setbox\@verbvisiblespacebox\hbox to\wd\z@{\hss\verbvisiblespace\hss}%
479   \def\@xobeysp{\leavevmode\copy\@verbvisiblespacebox}%
480 \fi
481 }
```

(End definition for \@setupverbvisiblespace.)

\@verbvisiblespacebox The box to hold the visible space character if it isn't in slot 32 in the current typewriter font.

```
482 \newbox\@verbvisiblespacebox
```

(End definition for \@verbvisiblespacebox.)

`verbatim*` For `verbatim*` we also set up the correct visible space character definition and then run `\@vobeyspaces`. As this code is not called as part of the normal `verbatim` environment (the method is done the other way around this time) we don't have to check if space is already active—it shouldn't be.

```

483 \namedef{verbatim*}{\@verbatim

```

`\@sverb` Definitions of `\@sverb` and `\@verb` changed so `\verb+ foo+` does not lose leading blanks
`\@@sverb` when it comes at the beginning of a line. Change made 24 May 89. Suggested by Frank Mittelbach and Rainer Schöpf.

```

500 </2ekernel>
501 <*2ekernel | latexrelease>
502 <latexrelease>\IncludeInRelease{2020/10/01}%
503 <latexrelease>           {\@sverb}{Drop spaces before \verb delimiter}%

```

If the users types `\verb !~! foo` then surprisingly we would get the space as the delimiter and thus “`!~!foo`” in the output. To avoid this scenario we check if `#1` has the character code of a space, if so we recurse otherwise we call `\@@sverb` (which is the original definition of `\@sverb`).

```

504 \def\@sverb#1{\if\noexpand#1 \expandafter\@sverb\else\@@sverb{#1}\fi}

505 \def\@@sverb#1{%
506   \catcode'#1\active
507   \lccode'\~'#1%
508   \gdef\verb@balance@group{\verb@egroup
509     \@latex@error{\noexpand\verb illegal in command argument}\@ehc}%
510   \aftergroup\verb@balance@group
511   \lowercase{\let~\verb@egroup}%

```

If `\@sverb` is called from `\@verb` then space is already active and supposed to produce a real space. In this case we do nothing. Otherwise we run `\@setupverbvisiblespace` to setup the right visible space char and afterwards `\@vobeyspaces` to make it the definition for the active space character.

```

512   \ifnum\catcode'\ =\active
513   \else \@setupverbvisiblespace \@vobeyspaces \fi
514 }

File F

ltmath.dtx

1 Math setup

This file contains a lot of the original plain T_EX code, as well as the L^AT_EX environments for math. It still needs sorting out.

```
1 \*2kernel)
2 \message{math definitions,}
```

1.1 Math commands based on plain T_EX

1.1.1 The log-like functions

`\log` The standard operators:

```
3 \DeclareRobustCommand\log{\mathop{\operator@font log}\nolimits}
4 \DeclareRobustCommand\lg{\mathop{\operator@font lg}\nolimits}
5 \DeclareRobustCommand\ln{\mathop{\operator@font ln}\nolimits}
6 \DeclareRobustCommand\lim{\mathop{\operator@font lim}}
7 \DeclareRobustCommand\limsup{\mathop{\operator@font lim}\nolimits,\sup}
8 \DeclareRobustCommand\liminf{\mathop{\operator@font lim}\nolimits,\inf}
9 \DeclareRobustCommand\sin{\mathop{\operator@font sin}\nolimits}
10 \DeclareRobustCommand\arcsin{\mathop{\operator@font arcsin}\nolimits}
11 \DeclareRobustCommand\sinh{\mathop{\operator@font sinh}\nolimits}
12 \DeclareRobustCommand\cos{\mathop{\operator@font cos}\nolimits}
13 \DeclareRobustCommand\arccos{\mathop{\operator@font arccos}\nolimits}
14 \DeclareRobustCommand\cosh{\mathop{\operator@font cosh}\nolimits}
15 \DeclareRobustCommand\tan{\mathop{\operator@font tan}\nolimits}
16 \DeclareRobustCommand\arctan{\mathop{\operator@font arctan}\nolimits}
17 \DeclareRobustCommand\tanh{\mathop{\operator@font tanh}\nolimits}
18 \DeclareRobustCommand\cot{\mathop{\operator@font cot}\nolimits}
19 \DeclareRobustCommand\coth{\mathop{\operator@font coth}\nolimits}
20 \DeclareRobustCommand\sec{\mathop{\operator@font sec}\nolimits}
21 \DeclareRobustCommand\csc{\mathop{\operator@font csc}\nolimits}
22 \DeclareRobustCommand\max{\mathop{\operator@font max}}
23 \DeclareRobustCommand\min{\mathop{\operator@font min}}
24 \DeclareRobustCommand\sup{\mathop{\operator@font sup}}
25 \DeclareRobustCommand\inf{\mathop{\operator@font inf}}
26 \DeclareRobustCommand\arg{\mathop{\operator@font arg}\nolimits}
27 \DeclareRobustCommand\ker{\mathop{\operator@font ker}\nolimits}
28 \DeclareRobustCommand\dim{\mathop{\operator@font dim}\nolimits}
29 \DeclareRobustCommand\hom{\mathop{\operator@font hom}\nolimits}
30 \DeclareRobustCommand\det{\mathop{\operator@font det}}
31 \DeclareRobustCommand\exp{\mathop{\operator@font exp}\nolimits}
32 \DeclareRobustCommand\Pr{\mathop{\operator@font Pr}}
33 \DeclareRobustCommand\gcd{\mathop{\operator@font gcd}}
34 \DeclareRobustCommand\deg{\mathop{\operator@font deg}\nolimits}
```

(End definition for \log.)

`\bmod` And some operators have to be done by hand:

```

35 \DeclareRobustCommand\bmod{%
36   \nonscript\mskip-\medmuskip\mkern5mu%
37   \mathbin{\operator@font mod}\penalty900\mkern5mu%
38   \nonscript\mskip-\medmuskip}

```

(End definition for \bmod.)

\pmod

```

39 \DeclareRobustCommand\pmod[1]{%
40   \allowbreak\mkern18mu({\operator@font mod}\,\,\,#1)}

```

(End definition for \pmod.)

1.1.2 Biggggg

\big Variants on \big and friends for use with delimiters:

```

41 \DeclareRobustCommand\bigl{\mathopen\big}
42 \DeclareRobustCommand\bigm{\mathrel\big}
43 \DeclareRobustCommand\biggr{\mathclose\big}
44 \DeclareRobustCommand\Bigl{\mathopen\Big}
45 \DeclareRobustCommand\Bigm{\mathrel\Big}
46 \DeclareRobustCommand\Biggr{\mathclose\Big}
47 \DeclareRobustCommand\biggl{\mathopen\bigg}
48 \DeclareRobustCommand\biggm{\mathrel\bigg}
49 \DeclareRobustCommand\biggr{\mathclose\bigg}
50 \DeclareRobustCommand\Biggl{\mathopen\Bigg}
51 \DeclareRobustCommand\Biggm{\mathrel\Bigg}

`\tmspace` Originally L^AT_EX only provided a small set of spacing commands for use in text and math, some of the commands like `\;` were only supported in math mode. `amsmath` normalized and provided all of them in text and math. This code has now been moved to the kernel so that it is generally available.

`\thinspace`

`\!`

`\negthinspace`

`\:`

`\medspace`

`\negmedspace`

`\;`

`\thickspace`

`\negthickspace`

```

201 </2ekernel>
202 <*2ekernel | latexrelease>
203 <latexrelease>\IncludeInRelease{2020/10/01}%
204 <latexrelease> \tmspace\amsmath spacing commands}%
205 \DeclareRobustCommand\tmspace[3]{%
206 \ifmmode\mskip#1#2\else\leavevmode\ifvmode\kern#1#3\fi\relax}

```

`\tmspace` is really meant to be an internal command so it doesn't necessarily has to be robust but it was robust in `amsmath` so we leave it like that.

In `amsmath` the text kern is `.1667em`. For compatibility reasons we keep the longer one.

```
207 \DeclareRobustCommand\,{\tmspace+\thinmuskip{.16667em}}
208 \let\thinspace\,
209 \DeclareRobustCommand\!{\tmspace-\thinmuskip{.16667em}}
210 \let\negthinspace\!
211 \DeclareRobustCommand\:{\tmspace+\medmuskip{.2222em}}
212 \let\medspace\:
```

L^AT_EX has a second name for this in its manual:

```
213 \let\>=\:
214 \DeclareRobustCommand\negmedspace{\tmspace-\medmuskip{.2222em}}
215 \DeclareRobustCommand\;{\tmspace+\thickmuskip{.2777em}}
216 \let\thickspace\;
217 \DeclareRobustCommand\negthickspace{\tmspace-\thickmuskip{.2777em}}

(End definition for \@seqncr.)

\lefteqn \lefteqn{FORMULA} typesets FORMULA in display math style flushleft in a box of width zero.

```

414 \def\lefteqn#1{\rlap{$\displaystyle #1$}}

```

(End definition for \lefteqn.)

\ensuremath In math mode, \ensuremath{text} is equivalent to text; in LR or paragraph mode, it is equivalent to \$text\$. \relax is not needed in front of the \ifmmode as \protect will be \let to \relax. This version (due to Donald Arseneau) avoids duplicating its argument in the 'then' and 'else' part of the \ifmath which is necessary in nested 'tabular' like environments. See amslatex/2104.

```

415 \DeclareRobustCommand{\ensuremath}{%

```

(End definition for `\@ensuredmath`.)

```
422 \endkernel
```

1.3 External options to the standard document classes

1.3.1 Left equation numbering

`\@eqnnum` To put the equation number on the left side of an equation we have to use a little trick. The number is shifted `\displaywidth` to the left inside a box of (approximately) zero width. This fails when the equation is too wide, the equation number then may overprint the equation itself.

```
423 \def\leqno{\noindent\hbox{\displaywidth\p@{}}%
424 \renewcommand\@eqnnum{\hb@xt@.01\p@{}}%
425 \rlap{\normalfont\normalcolor
426 \hskip -\displaywidth(\theequation)}}
427 \endleqno
```

(End definition for `\@eqnnum`.)

1.3.2 Flush left equations

To get the displayed math environments to print the contents flush left (with an indentation) we have to redefine all of L^AT_EX 2_ε's displayed math environments.

`\mathindent` The amount of indentation of the equations is stored in a register.

```
428 \def\fleqn{\newskip\mathindent}
```

The setting of `\mathindent` has to be deferred until the class file has been processed, because `\leftmargini` is still 0pt wide at the moment `\fleqn.clo` is read in.

```
430 \AtEndOfClass{\mathindent\leftmargini}
```

(End definition for `\mathindent`.)

1 List, and related environments

The generic commands for creating an indented environment – `enumerate`, `itemize`, `quote`, etc – are:

```
\list{<LABEL>}{<COMMANDS>} ... \endlist
```

which can be invoked by the user as the list environment. The LABEL argument specifies item labeling. COMMANDS contains commands for changing the horizontal and vertical spacing parameters.

Each item of the environment is begun by the command `\item[ITEMLABEL]` which produces an item labeled by ITEMLABEL. If the argument is missing, then the LABEL argument of the `\list` command is used as the item label.

The label is formed by putting `\makelabel{<ITEMLABEL>}` in an hbox whose width is either its natural width or else `\labelwidth`, whichever is larger. The `\list` command defines `\makelabel` to have the default definition:

```
\makelabel{<ARG>} == BEGIN \hfil ARG END
```

which, for a label of width less than `\labelwidth`, puts the label flushright, `\labelsep` to the left of the item's text. However, `\makelabel` can be `\let` to another command by the `\list`'s COMMANDS argument.

A `\usecounter{<foo>}` command in the second argument causes the counter *foo* to be initialized to zero, and stepped by every `\item` command without an argument. (`\label` commands within the list refer to this counter.)

When you leave a list environment, returning either to an enclosing list or normal text mode, LaTeX begins a new paragraph if and only if you leave a blank line after the `\end` command. This is accomplished by the `\@endparenv` command.

Blank lines are ignored every other reasonable place–i.e.:

- Between the `\begin{list}` and the first `\item`,
- Between the `\item` and the text of that item.
- Between the end of the last item and the `\end{list}`.

For an environment like quotation, in which items are not labeled, the entire environment is a single item. It is defined by letting `\quotation == \list{}{...}\item\relax`. (Note the `\relax`, there in case the first character in the environment is a '['.) The spacing parameters provide a great deal of flexibility in designing the format, including the ability to let the indentation of the first paragraph be different from that of the subsequent ones.

The trivlist environment is equivalent to a list environment whose second argument sets the following parameter values:

`\leftmargin = 0`: causes no indentation of left margin

`\labelwidth = 0`: see below for precise effect this has.

`\itemindent = 0`: with a null label, makes first paragraph have no indentation. Succeeding paragraphs have `\parindent` indentation. To give first paragraph same indentation, set `\itemindent = \parindent` before the `\item[]`.

Every `\item` in a `trivlist` environment must have an argument—in many cases, this will be the null argument (`\item[]`). The `trivlist` environment is mainly used for paragraphing environments, like `verbatim`, in which there is no margin change. It provides the same vertical spacing as the `list` environment, and works reasonably well when it occurs immediately after an `\item` command in an enclosing list.

1.1 List and Trivlist

The following variables are used inside a list environment:

`\totalleftmargin` The distance that the prevailing left margin is indented from the outermost left margin,

`\linewidth` The width of the current line. Must be initialized to `\hsize`.

`\listdepth` A count for holding current list nesting depth.

`\makelabel` A macro with a single argument, used to generate the label from the argument (given or implied) of the `\item` command. Initialized to `\mklab` by the `\list` command. This command must produce some stretch—i.e., an `\hfil`.

`\inlabel` A switch that is false except between the time an `\item` is encountered and the time that `TeX` actually enters horizontal mode. Should be tested by commands that can be messed up by the list environment's use of `\everypar`.

`\box\@labels` When `\inlabel = true`, it holds the labels to be put out by `\everypar`.

`\noparitem` A switch set by `\list` when `\inlabel = true`. Handles the case of a `\list` being the first thing in an item.

`\noparlist` A switch set true for a list that begins an item. No `\topsep` space is added before or after `\item`'s such a list.

`\newlist` Set true by `\list`, set false by the first text (by `\everypar`).

`\noitemarg` Set true when executing an `\item` with no explicit argument. Used to save space. To save time, make two separate `\@item` commands.

`\nmbrlist` Set true by `\usecounter` command, causes list to be numbered.

`\listctr` `\def`'ed by `\usecounter` to name of counter.

`\noskipsec` A switch set true by a sectioning command when it is creating an in-text heading with `\everypar`.

Throughout a list environment, `\hsize` is the width of the current line, measured from the outermost left margin to the outermost right margin. Environments like `tabbing` should use `\linewidth` instead of `\hsize`.

Here are the parameters of a list that can be set by commands in the `\list's` `COMMANDS` argument. These parameters are all `TeX` skips or dimensions (defined by `\newskip` or `\newdimen`), so the usual `TeX` or `LATeX` commands can be used to set them. The commands will be executed in `vmode` if and only if the `\list` was preceded by a `\par` (or something like an `\end{list}`), so the spacing parameters can be set according to whether the list is inside a paragraph or is its own paragraph.

1.2 Vertical Spacing (skips)

`\topsep`: Space between first item and preceding paragraph.

`\partopsep`: Extra space added to `\topsep` when environment starts a new paragraph (is called in `vmode`).

`\itemsep`: Space between successive items.

`\parsep`: Space between paragraphs within an item – the `\parskip` for this environment.

1.3 Penalties

`\@beginparpenalty`: put at the beginning of a list

`\@endparpenalty`: put at end of list

`\@itempenalty`: put between items.

1.4 Horizontal Spacing (dimens)

`\leftmargin`: space between left margin of enclosing environment (or of page if top level list) and left margin of this list. Must be nonnegative.

`\rightmargin`: analogous.

`\listparindent`: extra indentation at beginning of every paragraph of a list except the one started by the `\item` command. May be negative! Usually, labeled lists have `\listparindent` equal to zero.

`\itemindent`: extra indentation added right BEFORE an item label.

`\labelwidth`: nominal width of box that contains the label. If the natural width of the label \leq `\labelwidth`, then the label is flushed right inside a box of width `\labelwidth` (with an `\hfil`). Otherwise, a box of the natural width is employed, which causes an indentation of the text on that line.

`\labelsep`: space between end of label box and text of first item.

1.5 Default Values

Defaults for the list environment are set as follows. First, `\rightmargin`, `\listparindent` and `\itemindent` are set to 0pt. Then, one of the commands `\@listi`, `\@listii`, ... , `\@listvi` is called, depending upon the current level of the list. The `\@list ...` commands should be defined by the document style. A convention that the document style should follow is to set `\leftmargin` to `\leftmargini`, ..., `\leftmarginvi` for the appropriate level. Items that aren't changed may be left alone, but everything that could possibly be changed must be reset. *Historical L^AT_EX 2.09 comments (not necessarily accurate any more)*:

(End definition for `\endtrivlist`.)

`\@endparenv` To suppress the paragraph indentation in text immediately following a paragraph-making environment, `\everypar` is changed to remove the space, and `\par` is redefined to restore `\everypar`. Instead of redefining `\par` and `\everypar`, `\@endparenv` was changed to set the `@endpe` switch, letting `\end` redefine `\par` and `\everypar`.

This allows paragraph-making environments to work right when called by other environments. (Changed 27 Oct 86)

```
183     \if@inlabel
184     \global\@inlabelfalse
```

The paragraph indent is now removed by using `\setbox...` since this makes `\noindent` a no-op here, as it should be. Thus the following comment is redundant but is left here for the sake of future historians: this next command was changed from an `hskip` to a `kern` to avoid a break point after the `parindent` box: the skip could cause a line-break if a very long label occurs in `raggedright` setting. If `\noindent` was used after `\item` want to cancel the `\itemindent` skip. This case can be detected as the indentation box will be void.

```
185     {\setbox\z@\lastbox
186     \ifvoid\z@
187     \kern-\itemindent
188     \fi}%

189     \box\@labels
190     \penalty\z@
191     \fi
```

This code is intended to prevent a page break after the first line of an item that comes immediately after a section title. It may be sensible to always forbid a page break after one line of an item? As with all such settings of `\clubpenalty` it is local so will have no effect if the item starts in a group.

Only resetting `\@nobreak` when it is true is now essential since now it is sometimes set locally.

```
192     \if@nobreak
193     \@nobreakfalse
194     \clubpenalty \@M

1.6 Itemize and Enumerate

Enumeration is done with four counters: `enumi`, `enumii`, `enumiii` and `enumiv`, where `enumN` controls the numbering of the Nth level enumeration. The label is generated by the commands `\labelenumi` ... `\labelenumiv`, which should be defined by the document style. Note that `\p@enumN\theenumN` defines the output of a `\ref` command. A typical definition might be:

```

\def\theenumii{\alph{enumii}}
\def\p@enumii{\theenumi}
\def\labelenumii{(\theenumii)}

```

which will print the labels as ‘(a)’, ‘(b)’, ... and print a `\ref` as ‘3a’.

The item numbers are moved to the right of the label box, so they are always a distance of `\labelsep` from the item.

`\@enumdepth` holds the current enumeration nesting depth.

Itemization is controlled by four commands: `\labelitemi`, `\labelitemii`, `\labelitemiii`, and `\labelitemiv`. To cause the second-level list to be bulleted, you just define `\labelitemii` to be `•`. `\@itemspacing` and `\@itemdepth` are the analogs of `\@enumspacing` and `\@enumdepth`.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```

\enumerate ==
BEGIN
  if \@enumdepth > 3
    then errormessage: “Too deeply nested”.
    else \@enumdepth :=L \@enumdepth + 1

```

File H

ltboxes.dtx

1 L^AT_EX Box commands

<code>\makebox</code>	<code>\makebox[⟨wid⟩][⟨pos⟩]{⟨obj⟩}</code> Puts <code>⟨obj⟩</code> in an <code>\hbox</code> of width <code>⟨wid⟩</code> , positioned by <code>⟨pos⟩</code> . The possible <code>⟨pos⟩</code> are: s stretched, l flushleft, r flushright, c (default) centred. If <code>⟨wid⟩</code> is missing, then <code>⟨pos⟩</code> is also missing and <code>⟨obj⟩</code> is put in an <code>\hbox</code> of its natural width. <code>\makebox(⟨x⟩,⟨y⟩)[⟨pos⟩]{⟨obj⟩}</code> Puts <code>⟨obj⟩</code> in an <code>\hbox</code> of width <code>x * \unitlength</code> and height <code>y * \unitlength</code> . <code>⟨pos⟩</code> arguments are s, l, r or c (default) for stretched, flushleft, flushright or centred, and t or b for top, bottom – or combinations like tr or rb. Default for horizontal and vertical are centered. Note that in this picture mode version of <code>\makebox</code> a [b] aligns on the <i>bottom</i> of the text as documented. If you want to align on the <i>baseline</i> use <code>\makebox(,) [b]{\raisebox{0pt}{\height}[0pt]{xyz}}</code> or <code>\makebox(,) [b]{\smash{xyz}}</code>
<code>\mbox</code>	<code>\mbox{⟨obj⟩}</code> The same as <code>\makebox{⟨obj⟩}</code> , but is more efficient as no checking for optional arguments is done.
<code>\newsavebox</code>	<code>\newsavebox{⟨cmd⟩}</code> : If <code>⟨cmd⟩</code> is undefined, then defines it to be a T _E X box register.
<code>\savebox</code>	<code>\savebox{⟨cmd⟩} ...</code> : <code>⟨cmd⟩</code> is defined to be a T _E X box register, and the ‘...’ are any <code>\makebox</code> arguments. It is like <code>\makebox</code> , except it doesn’t produce text but saves the value in <code>\box ⟨cmd⟩</code> .
<code>\sbox</code>	<code>\sbox{⟨cmd⟩}{⟨obj⟩}</code> is an efficient abbreviation for <code>\savebox{⟨cmd⟩}{⟨obj⟩}</code> .
<code>lrbox</code>	<code>\begin{lrbox}{⟨cmd⟩}⟨text⟩\end{lrbox}</code> is equivalent to <code>\sbox{⟨cmd⟩}{⟨text⟩}</code> except that any white space at the beginning and end of <code>⟨text⟩</code> is ignored.
<code>\framebox</code>	<code>\framebox ...</code> : like <code>\makebox</code> , except it puts a ‘frame’ around the box. The frame is made of lines of thickness <code>\fboxrule</code> , separated by space <code>\fboxsep</code> from the text – except for <code>\framebox(X,Y) ...</code> , where the thickness of the lines is as for the picture environment, and there is no separation added.
<code>\fbox</code>	<code>\fbox{⟨obj⟩}</code> is an abbreviation for <code>\framebox{⟨obj⟩}</code> .
<code>\parbox</code>	<code>\parbox[⟨pos⟩][⟨height⟩][⟨inner-pos⟩]{⟨width⟩}{⟨text⟩}</code> : Makes a box with <code>\hsize</code> <code>⟨width⟩</code> , positioned by <code>⟨pos⟩</code> as follows: c : <code>\vcenter</code> (placed in <code>\$...\$</code> if not in math mode) b : <code>\vbox</code> t : <code>\vtop</code> default value is c. Sets <code>\hsize := ⟨width⟩</code> and calls <code>\@parboxrestore</code> , which does the following: Restores the original definitions of: <code>\par</code> <code>\</code> <code>\-</code> <code>\,</code> <code>\‘</code> <code>\=</code>

Resets the following parameters:

<code>\parindent</code>	<code>= 0pt</code>	
<code>\parskip</code>	<code>= 0pt</code>	added 20 Jan 87
<code>\linewidth</code>	<code>= \hsize</code>	
<code>\@totalleftmargin</code>	<code>= 0pt</code>	
<code>\leftskip</code>	<code>= 0pt</code>	
<code>\rightskip</code>	<code>= 0pt</code>	
<code>\@rightskip</code>	<code>= 0pt</code>	
<code>\parfillskip</code>	<code>= 0pt plus 1fil</code>	
<code>\lineskip</code>	<code>= \normallineskip</code>	
<code>\baselineskip</code>	<code>= \normalbaselineskip</code>	

Calls `\sloppy`

Note: `\@arrayparboxrestore` same as `\@parboxrestore` but it doesn't restore `\@minipage` : Similar to `\parbox`, except it also makes this look like a page by setting `\textwidth == \columnwidth == box width`

`\minipage` changes footnotes by redefining:

```

\@mpfn == mpfootnote
\thempfn == \thempfootnote
\@footnotetext == \@mpfootnotetext

```

resets the following list environment parameters:

```

\@listdepth == \@mplistdepth

```

where `\@mplistdepth` is initialized to zero,

and executes `\@minipagerestore` to allow the document style to reset any other parameters it desires. It sets `@minipage` true, and resets `\everypar` to set it false. This switch keeps `\addvspace` from putting space at the top of a minipage.

Change added 24 May 89: `\minipage` sets `@minipage` globally; `\endminipage` resets it false.

<code>\rule</code>	<code>\rule[⟨raised⟩]{⟨width⟩}{⟨height⟩}</code> : Makes a <code>⟨width⟩*⟨height⟩</code> rule, raised <code>⟨raised⟩</code> .
<code>\underline</code>	<code>\underline{⟨text⟩}</code> : Makes an underlined hbox with <code>⟨text⟩</code> in it.
<code>\raisebox</code>	<code>\raisebox{⟨distance⟩}[⟨height⟩][⟨depth⟩]{⟨box⟩}</code> :

Raises `⟨box⟩` up by `⟨distance⟩` length (down if `⟨distance⟩` negative). Makes T_EX think that the new box extends `⟨height⟩` above the line and `⟨depth⟩` below, for a total vertical length of `⟨height⟩+⟨depth⟩`. Default values of `⟨height⟩` & `⟨depth⟩` = actual height and depth of box in new position.

\@arrayparboxrestore Restore various paragraph parameters.

The rationale for allowing two normally global flags to be set locally here was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within boxes or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in \set@nbreak; otherwise this command will be redundant.

457   \ifx\#2\\\else\ht\@tempboxa\@tempdimb\fi
458   \box\@tempboxa
459   \@end@tempboxa}

(End definition for \@irsbox.)

\@iirsbox Internal version of \raisebox (two optional args).
460 \long\def\@iirsbox#1[#2][#3]#4{%
461   \@begin@tempboxa\hbox{#4}%
462   \setlength\@tempdima{#1}%
463   \setlength\@tempdimb{#2}%
464   \setlength\dimen@{#3}%
465   \setbox\@tempboxa\hbox{\raise\@tempdima\box\@tempboxa}%
466   \ht\@tempboxa\@tempdimb
467   \dp\@tempboxa\dimen@
468   \box\@tempboxa
469   \@end@tempboxa}

(End definition for \@iirsbox.)

\@finalstrut This macro adds a special strut the depth of the box given as #1, and height and width
Opt. It is used for ensuring that the last line of a paragraph has the correct depth in
‘p’ columns of tables and in footnotes. In vertical mode nothing is done, as adding the
strut (as done in 2.09) would start a new paragraph. It would be possible to inspect
\prevdepth to check the depth of the just-completed paragraph, but we do not do that
here. Actually we do even less now, skip the vmode test as it broke tabular ‘p’ columns.
.

The \nobreak was added (1995/10/31) to allow hyphenation of the final word of the
paragraph.
470 \def\@finalstrut#1{%
471   \unskip\ifhmode\nobreak\fi\vrule\@width\z@\@height\z@\@depth\dp#1}

(End definition for \@finalstrut.)

```

1.1 Some low-level constructs

The following commands are basically inherited from plain T_EX.

```
\leftline These macros place text on a full line either centred or left or right adjusted.
\rightline
\centerline
  @@line
```

472 `\def\@@line{\hb@xt@\hsize}`
473 `\DeclareRobustCommand\leftline[1]{\@@line{#1\hss}}`
474 `\DeclareRobustCommand\rightline[1]{\@@line{\hss#1}}`
475 `\DeclareRobustCommand\centerline[1]{\@@line{\hss#1\hss}}`

(End definition for \leftline and others.)

```
\rlap These macros place text to the left or right of the current reference point without taking
\llap up space.
\clap
```

476 `\DeclareRobustCommand\rlap[1]{\hb@xt@\z@{#1\hss}}`
477 `\DeclareRobustCommand\llap[1]{\hb@xt@\z@{\hss#1}}`

And here is the version that centers, it was initially introduced by `mathtools`.

```
478 \DeclareRobustCommand\clap[1]{\hb@xt@\z@{\hss#1\hss}}
```

(End definition for \rlap, \llap, and \clap.)

```
479 \</2ekernel>
```

1 Tabbing, Tabular and Array Environments

This section deals with ‘Lining It Up in Columns’. First the `tabbing` environment is defined, and then in second part, `tabular` together with its variants, `tabular*` and `array`.

Note that the `tabular` defined here is essentially the original L^AT_EX 2.09 version, not the extended version described in *The L^AT_EX Companion*. Use the `array` package to obtain the extended version.

1.1 tabbing

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

`\dimen\@firsttab + i` = distance of tab stop `i` from left margin
0 <= `i` <= 15 (?).

`\dimen\@firsttab` is initialized to `\@totalleftmargin`, so it starts at the prevailing left margin.

`\@maxtab` = number of highest defined tab register
probably = `\@firsttab + 12`

`\@nxttabmar` = tab stop number of next line’s left margin

`\@curtabmar` = tab stop number of current line’s left margin

`\@curtab` = number of the current tab. At start of line,
it equals `\@curtabmar`

`\@hightab` = largest tab number currently defined.

`\@tabpush` = depth of `\pushtab`’s

`\box\@curline` = contents of current line, excluding left margin
skip, and excluding contents of current field

`\box\@curfield` = contents of current field

`@rjfield` = switch: T iff the last field of the line should
be right-justified at the right margin.

`\tabbingsep` = distance left by the `\’` command between the
current position and the field that is
“left-shifted”.

UTILITY MACROS

`\@stopfield` : closes the current field

`\@addfield` : adds the current field to the current line.

`\@contfield` : continues the current field

`\@startfield` : begins the next field

`\@stopline` : closes the current line and outputs it

```

\@startline : starts the next line
\@ifatmargin : an \if that is true iff the current line.
                has width zero

1.2 array and tabular environments

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

ARRAY PARAMETERS:

`\arraycolsep`
: half the width separating columns in an array environment

`\tabcolsep`
: half the width separating columns in a tabular environment

`\arrayrulewidth`
: width of rules

`\doublerulesep`
: space between adjacent rules in array or tabular

`\arraystretch`
: line spacing in array and tabular environments is done by placing a strut in every row of height and depth `\arraystretch` times the height and depth of the strut produced by an ordinary `\strut` command.

PREAMBLE:

The PREAMBLE argument of an array or tabular environment can contain the following:

`l,r,c` : indicate where entry is to be placed.
`|` : for vertical rule
`@{EXP}` : inserts the text EXP in every column.
`\arraycolsep` or `\tabcolsep` spacing is suppressed.
`*{N}{PRE}` : equivalent to writing N copies of PRE in the preamble.
PRE may contain `*{N'}{EXP'}` expressions.
`p{LEN}` : makes entry in parbox of width LEN.

SPECIAL ARRAY COMMANDS:

`\multicolumn{N}{FORMAT}{ITEM}` : replaces the next N column items by ITEM, formatted according to FORMAT. FORMAT should contain at most one l,r or c. If it contains none, then ITEM is ignored.

`\vline` : draws a vertical line the height of the current row. May appear in an array element entry.

`\hline` : draws a horizontal line between rows. Must appear either before the first entry (to appear above the first row) or right after a `\\` command. If followed by another `\hline`, then adds a `\vskip` of `\doublerulesep`.

`\cline{i-j}` : draws horizontal lines between rows covering columns i through j, inclusive. Multiple commands may follow one another to provide lines covering several disjoint columns

`\extracolsep{WIDTH}` : for use inside an @ in the preamble. Causes a WIDTH space to be added between columns for the rest of the columns. This is in addition to the ordinary intercolumn space.

```

```

```
180 \let\@classiv\@tabclassiv \let\\\@tabularcr\@tabarray}
```

(End definition for \@tabular.)

`\@tabarray` RmS 91/11/04 added `\m@th`.

```
181 \def\@tabarray{\m@th\@ifnextchar[\@array{\@array[c]}}
```

(End definition for \@tabarray.)

RmS 1993/11/03 changed `\halign` to `\ialign` and removed superfluous `\tabskip` assignment

`\@array`

```
182 \def\@array[#1]#2{%
```

```
183 \if #1t\vtop \else \if#1b\vbox \else \vcenter \fi\fi
```

184 **\bgroup**

This next bit of code sets up the strut and then builds the halign and its preamble according to the specification in the second argument.

This code has been moved inside the box. A side effect of this has been to expose what was a buglet in the previous version: since the **\@arstrut** below is expanded and contains an **\ifmmode** then it could produce an unnecessary extra box in every row, thus wasting ‘lots of’ main memory.

```
185    \setbox\@arstrutbox\hbox{%
186       \vrule \@height\arraystretch\ht\strutbox
187       \@depth\arraystretch \dp\strutbox
188       \@width\z@}%
189    \@mkpream{#2}%
190    \edef\@preamble{%
191       \ialign \noexpand\@halignto
192       \bgroup \@arstrut \@preamble \tabskip\z@skip \cr}%
```

That is the end of setting up the preamble; now we reset things before executing the halign built-up in **\@preamble**. The restorations could be done by introducing an extra group, thus saving tokens.

```
193    \let\@startpbox\@startpbox \let\@endpbox\@endpbox
194    \let\@tabularnewline\%
195    \let\par\@empty
196    \let\@sharp##%
197    \set@typeset@protect
198    \lineskip\z@skip\baselineskip\z@skip
```

If the parsing of the preamble goes wrong there may be some characters left which T_EX then tries to typeset, i.e., we would be in horizontal mode. That would produce an endless loop because the **\halign** expects vertical mode thus issues a **\par** but that is a no-op at this point. So we better test this case issue some error message and make a crude recovery by ending that horizontal mode with force. A better fix would be to ensure that we never pick up more than a single character token (not done).

```
199    \ifhmode \@preamerr\z@ \@@par\fi
200    \@preamble}
```

(End definition for \@array.)

\@arraycr Array version of **\@array**.

`\multicolumn` *Historical L^AT_EX 2.09 comments (not necessarily accurate any more):*

```

\multicolumn{NUMBER}{FORMAT}{ITEM} ==
BEGIN
\multispan{NUMBER}
\begingroup
\@addamp == null
\@mkpream{FORMAT}
\@sharp == ITEM
\protect == \relax
\@startpbox == \@startpbox
\@endpbox == \@endpbox
\@arstrut
\@preamble
\endgroup
END

```

End of historical L^AT_EX 2.09 comments.

The command `\def\@addamp{}` was removed from `\multicolumn` on 6 Dec 86 because it caused embedded array environments not to work. I think that it was included originally to prevent an error message if the 2nd argument to the `\multicolumn` command had two column specifiers.

8 Feb 89 — `\hbox{}` added after `\@preamble` to correct bug that occurred if `\multicolumn` preceded `\\[D]` with $D > 0$, caused by `\\[]` command doing an `\unskip`, which removed `\tabcolsep` glue inserted by `\multicolumn`.

This has been made long so that, for example, a p-column can contain multiple paragraphs; maybe the arguments of @-expressions should also be able to contain multiple paragraphs.

```

233 \long\def\multicolumn#1#2#3{\multispan{#1}\begingroup
234   \@mkpream{#2}%
235   \def\@sharp{#3}\set@typeset@protect

237   \@arstrut \@preamble\hbox{}\endgroup\ignorespaces}

```

(End definition for \multicolumn.)

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

Codes for classes and character numbers of array, tabular and multicolumn arguments.

Character	Class	Number
c	0	0
l	0	1
r	0	2
	1	-
@	2	-
p	3	-
{@-exp}	4	-
{p-arg}	5	-

`\@testpach \foo` : expands `\foo`, which should be an array parameter

token, and sets \@chclass and \@chnum to its class and number. Uses \@lastchclass to distinguish 4 and 5

Preamble error codes

0: 'illegal character'
 1: 'Missing @-exp'
 2: 'Missing p-arg'

`\cline` The old L^AT_EX2.09 implementation of `\cline` used up quite a lot of memory and two precious count registers. This new (1995/09/14) implementation does not use any count registers. It is coded in a way that depends heavily on the definition of `\multispan` so that command has been moved here from the file `ltpplain.dtx`.

These counters are no longer declared.

```
\newcount\@cla
```

```
\newcount\@clb
```

```
367 \def\cline#1{\@cline#1\@nil}
```

```
368 \def\@cline#1-#2\@nil{%
```

```
369 \omit
```

Use the counter from `\multispan`.

```
370 \@multicnt#1%
```

```
371 \advance\@multispan\m@ne
```

```
372 \ifnum\@multicnt=\@ne\@firstofone{&\omit}\fi
```

```
373 \@multicnt#2%
```

```
374 \advance\@multicnt-#1%
```

```
375 \advance\@multispan\@ne
```

The original had `\unskip` at this point, but how could a skip get here ???

```
376 \leaders\hrule\@height\arrayrulewidth\hfill
```

```
377 \cr
```

This is back spacing is fairly horrible, but it is what happened in the old version... An alternative would be to make `\cline` look ahead for a following `\cline` as does `\hline`. This would alter the spacing in existing documents so keep the old version in the kernel. Perhaps a package should do this differently.

```
378 \noalign{\vskip-\arrayrulewidth}}
```

(End definition for `\cline` and `\@cline`.)

`\mscount` The `\mscount` counter is no longer declared, saving a csname and a register. It is declared in compatibility mode.

(End definition for `\mscount`.)

`\multispan` Modify `\multispan` slightly from its plain T_EX definition to allow more efficient code sharing with `\multicolumn`. Also share a count register with `\multipt`.

```
\@multispan \sp@n 379 \def\multispan{\omit\@multispan}
```

```
380 \def\@multispan#1{%
```

```
381 \@multicnt#1\relax
```

```
382 \loop\ifnum\@multicnt>\@ne \sp@n\repeat}
```

```
383 \def\sp@n{\span\omit\advance\@multicnt\m@ne}
```

(End definition for `\multispan`, `\@multispan`, and `\sp@n`.)

`\@startpbox` Helper macros for ‘p’ columns.

```
\@endpbox \@startpbox{<width>} text \egroup is essentially \parbox{<width>}{<text>}
```

`\@endpbox` is essentially `\unskip \strut \par \egroup\hfil` (Changed 14 Jan 89)
(changed again 1994/05/13)

```
384 \def\@startpbox#1{\vtop\bgroup \setlength\hsize{#1}\@arrayparboxrestore}
```

```
385 \def\@endpbox{\@finalstrut\@arstrutbox\par\egroup\hfil}
```

14 Jan 89: Def of \@endpbox changed from
`\def\@endpbox{\par\vskip\dp\@arstrutbox\egroup\hfil}`
so vertical spacing works out right if the last line of a ‘p’ entry has a descender.

(End definition for \@startpbox and \@endpbox.)

1 Picture Mode

Picture mode commands. In addition to the commands available in L^AT_EX2.09, This section adds the new `\qbezier` command for drawing curves.

`\qbezier` `\qbezier[N]($\langle AX,AY \rangle$)($\langle BX,BY \rangle$)($\langle CX,CY \rangle$)` plots a quadratic Bezier curve from ($\langle AX,AY \rangle$) to ($\langle CX,CY \rangle$), with ($\langle BX,BY \rangle$) as the third Bezier point, using $N+1$ points equally spaced parametrically. If $N = 0$ (the default value), then a sufficient number of points are used to draw a connected curve—except that at most `\qbeziermax+1` points are drawn. A “point” is a square of side `\@wholewidth`.

`\bezier` In addition, to be compatible with the old `bezier` package, a variant of this command, `\bezier`, is defined, in which the first argument is not optional.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

<code>\unitlength</code>	= value of dimension argument
<code>\@wholewidth</code>	= current line width
<code>\@halfwidth</code>	= half of current line width
<code>\@linefnt</code>	= font for drawing lines
<code>\@circlefnt</code>	= font for drawing circles

`\linethickness{DIM}` : Sets the width of horizontal and vertical lines in a picture to DIM. Does not change width of slanted lines or circles. Width of all lines reset by `\thinlines` and `\thicklines`

```
\picture(XSIZE,YSIZE)(XORG,YORG)
  BEGIN
    \@picht :=L YSIZE * \unitlength
    box \@picbox :=
      \hb@xt@ XSIZE * \unitlength
      {\hskip -XORG * \unitlength
       \lower YORG * \unitlength
       \hbox{
         \ignorespaces      %% added 13 June 89
       }
    }
  END
```

```
\endpicture ==
  BEGIN
    } \hss }
    height of \@picbox := \@picht
    depth of \@picbox := 0
    \mbox{\box\@picbox}    %% change 26 Aug 91
  END
```

```
\put(X, Y){OBJ} ==
  BEGIN
```

```

\@killglue
\raise Y * \unitlength \hb@xt@ 0pt { \hskip X * \unitlength
                                OBJ \hss }

\ignorespaces
END

\multiput(X,Y)(DELX,DELY){N}{OBJ} ==
BEGIN
\@killglue
\@multicnt := N
\@xdim := X * \unitlength
\@ydim := Y * \unitlength
while \@multicnt > 0
do \raise \@ydim \hb@xt@ 0pt { \hskip \@xdim
                                OBJ \hss }

\@multicnt := \@multicnt - 1
\@xdim := \@xdim + DELX * \unitlength
\@ydim := \@ydim + DELY * \unitlength
od
\ignorespaces
END

```

`\shortstack[POS]{TEXT}` : Makes a `\vbox` containing TEXT stacked as a one-column array, positioned l, r or c as indicated by POS.

End of historical L^AT_EX 2.09 comments.

The ‘2ekernel’ code ensures that a `\usepackage{autopict}` is essentially ignored if a ‘full’ format is being used that has picture mode already in the format.

```
1 \langle 2ekernel \rangle \expandafter \let \csname ver@autopict.sty \endcsname \fmtversion
```

```

\@wholewidth
\@halfwidth 2 \langle *2ekernel \rangle
3 \newdimen \@wholewidth
4 \newdimen \@halfwidth

(End definition for \@wholewidth and \@halfwidth.)

```

```

\unitlength
5 \newdimen \unitlength \unitlength = 1pt

(End definition for \unitlength.)

```

```

\@picbox
\@picht 6 \newbox \@picbox
7 \newdimen \@picht

(End definition for \@picbox and \@picht.)

```

`\@defaultunitsset` Set a length register, #1, accepting number or an etex length expression, #2, with default unit, #3.

The register name in #1 can be prefixed by `\advance` so that the register is incremented by the supplied value.

`\@defaultunitsset{\advance\@vxx}{\textwidth-15pt}\unitlength`

#3 can be a literal unit such as `cm` or a length register such as `\unitlength`.

This is used in all `picture` commands that take picture coordinates. So `\put(2,2)` as previously but now `\put(\textwidth-5cm,0.4\textheight)` Note that you can only use expressions with lengths, `\put(1+2,0)` is not supported.

```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

CIRCLES AND OVALS

USER COMMANDS:

`\circle{D}` : Produces the circle with the diameter as close as possible to $D * \text{\unitlength}$. `\put(X,Y){\circle{D}}` puts the circle with its center at (X,Y).

`\oval(X,Y)` : Makes an oval as round as possible that fits in the rectangle of width $X * \text{\unitlength}$ and height $Y * \text{\unitlength}$. The reference point is the center.

`\oval(X,Y)[POS]` : Save as `\oval(X,Y)` except it draws only the half or quadrant of the oval indicated by POS. E.G., `\oval(X,Y)[t]` draws just the top half and `\oval(X,Y)[br]` draws just the bottom right quadrant. In all cases, the reference point is the same as the unqualified `\oval(X,Y)` command.

`\@ovvert {DELTA1} {DELTA2}` : Makes a vbox containing either the left side or the right side of the oval being constructed. The baseline will coincide with the outside bottom edge of the oval; the left side of the box will coincide with the left edge of the vertical

rule. The width of the box will be `\@tempdima`.
`DELTA1` and `DELTA2` are added to the character number in `\@tempcnta`
to get the characters for the top and bottom quarter circle pieces.

`\@ovhorz` : Makes an hbox containing the straight rule for either the
top or the bottom of the oval being constructed. The baseline
will coincide with bottom edge of the rule; the left side of
the box will coincide with the left side of the oval.
The width of the box will be `\@ovxx`.

`\@getcirc {DIAM}` : Sets `\@tempcnta` to the character number
of the top-right quarter circle with the largest
diameter less than or equal to `DIAM`.
Sets `\@tempboxa` to an hbox containing that character.
Sets `\@tempdima` to `\wd \@tempboxa`, which is the distance
from the circle's left outside edge to its right
inside edge.
(These characters are like those described in the
TeXbook, pp. 389-90.)

1.1 Curves

The new `\qbezier` command, based on the old `\bezier` defined in `bezier.sty`.
Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```

\qbezier[N] == \bezier{N}

\bezier{N}(AX,AY)(BX,BY)(CX,CY) ==
BEGIN
  IF N = 0
  THEN \@xdima := |BX - AX|
       \@xb := |CX - BX|
       \@xa := Max(\@xa, \@xb)
       \@ya := |BY - AY|
       \@yb := |CY - BY|
       \@ya := Max(\@ya, \@yb)
       @sc := Max(\@xa, \@ya)
       %% The coefficient .5 below is the degree of overlap of
       %% successive points, where 1 is no overlap and 0 is

```

```

%% complete overlap. A coefficient of C multiplies
%% the number of points plotted by 1/C.
%%
\@xa := .5 * \@halfwidth
@sc := @sc / \@halfwidth
@sc := Max(@sc, qbeziermax)
ELSE @sc := N
@scp := @sc+1
\@xb := 2 * (BX - AX) * \unitlength
\@xa := ((CX-AX)*\unitlength - \@xb)/@sc
\@yb := 2 * (BY - AY) * \unitlength
\@ya := ((CY-AY)*\unitlength - \@yb)/@sc
\@pictdot := square rule of width \@wholewidth
\count@ := 0
WHILE \count@ < @scp
DO \@xdim := ((\count@*\@xa + @xb) / @sc) * \count@
\@ydim := ((\count@*\@ya + @yb) / @sc) * \count@
plot pt with relative coords (\@xdim,\@ydim)
\count@ := \count@+1
OD

```

End of historical L^AT_EX 2.09 comments.

\qbeziermax The maximum number of points to plot.

```
681 \def\qbeziermax{500}
```

(End definition for \qbeziermax.)

In the code below, to save registers \@a ... are not used. Instead other registers are reused.

```

\newcounter{@sc} -> \c@multicnt
\newcounter{@scp} -> \@tempcnta
\newdimen\@xa -> \@ovxx
\newdimen\@xb -> \@ovdx
\newdimen\@ya -> \@ovyy
\newdimen\@yb -> \@ovdy
\newsavebox{\@pictdot} -> \@tempboxa

```

\qbezier Main user-level command to plot quadratic bezier curves. #2 should be (.

```

ltthm.dtx

1 Theorem Environments

The user creates his own theorem-like environments with the command

```
\newtheorem{<name>}{<text>}[<counter>] or  
\newtheorem{<name>}[<oldname>]{<text>}
```

This defines the environment $\langle name \rangle$ to be just as one would expect a theorem environment to be, except that it prints $\langle text \rangle$ instead of “Theorem”.

If $\langle oldname \rangle$ is given, then environments $\langle name \rangle$ and $\langle oldname \rangle$ use the same counter, so using a $\langle name \rangle$ environment advances the number of the next $\langle name \rangle$ environment, and vice-versa.

If $\langle counter \rangle$ is given, then environment $\langle name \rangle$ is numbered within $\langle counter \rangle$.

E.g., if $\langle counter \rangle = \text{subsection}$, then the first $\langle name \rangle$ in subsection 7.2 is numbered $\langle text \rangle$ 7.2.1.

The way $\langle name \rangle$ environments are numbered can be changed by redefining $\backslash the\langle name \rangle$.
Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

DOCUMENT STYLE PARAMETERS

$\backslash thmcounter\{COUNTER\}$: A command such that

```
\edef\theCOUNTER{\@thmcounter{COUNTER}}
```

defines $\backslash theCOUNTER$ to produce a number for a theorem environment.

The default is:

```
BEGIN \noexpand\arabic{COUNTER} END
```

$\backslash thmcountersep$: A separator placed between a theorem number and the number of the counter within which it is numbered.

E.g., to make the third theorem of section 7.2 be numbered 7.2-3, $\backslash thmcountersep$ should be $\backslash def$ 'ed to '-'. Its default is '..

$\backslash @begintheorem\{NAME\}\{NUMBER\}$: A command that begins a theorem environment for a 'theorem' named 'NAME NUMBER' – e.g., $\backslash @begintheorem\{Lemma\}\{3.7\}$ starts Lemma 3.7.

$\backslash @opargbegintheorem\{NAME\}\{NUMBER\}\{OPARG\}$:

A command that begins a theorem environment for a 'theorem' named 'NAME NUMBER' with optional argument OPARG – e.g., $\backslash @begintheorem\{Lemma\}\{3.7\}\{Jones\}$ starts 'Lemma 3.7 (Jones)':.

$\backslash @endtheorem$: A command that ends a theorem environment.

$\backslash newtheorem\{NAME\}\{TEXT\}[COUNTER] ==$

BEGIN

if $\backslash NAME$ is definable

```

then \@definecounter{NAME}
  if COUNTER present
    then \@newctr{NAME}[COUNTER] fi

  \ignorespaces
END

\@ythm{NAME}{TEXT}[OPARG] ==
BEGIN
  \@opargbegintheorem{TEXT}{\theNAME}{OPARG}
  \ignorespaces
END

```

End of historical L^AT_EX 2.09 comments.

`\newtheorem` `\newtheorem` ought really be allowed only in the preamble Which would be good document style, and allow some main memory to be saved by declaring these commands to be `\@onlypreamble`. Unfortunately the L^AT_EX book indicates that `\newtheorem` may be used anywhere in the document...

File L

ltsect.dtx

1 Sectioning Commands

This file defines the declarations such as `\author` which are used by `\maketitle`. `\maketitle` itself is defined by each class, not in the L^AT_EX kernel.

The second part of the file defines the generic commands used for defining sectioning commands such as `\chapter`. Again the actual document level commands are defined in the class files, in terms of these commands.

```
1 <*2ekernel>
2 \message{title,}
```

1.1 The Title

```
\title The user defines the title and author by the declarations \title{<name>}, \author{<name>}
\author Similarly the date is declared with \date{<date>}.
\date Inside these, the \thanks{<footnote text>} command may be used to make acknowl-
\thanks edgements, notice of address, etc. in a footnote. If there are multiple authors, they have
\and to be separated with the \and command.
\maketitle And finally, the \maketitle command produces the actual title, using the informa-
tion previously saved with the other commands.

3 </2ekernel>
4 <*2ekernel | latexrelease>
5 <latexrelease>\IncludeInRelease{2019/10/01}%
6 <latexrelease> {\title}{Make commands robust}%

\title \title for use in \maketitle. If not given \maketitle will produce an error message.
7 \DeclareRobustCommand\title[1]{\gdef\@title{#1}}

(End definition for \title.)

\author \author for use in \maketitle. If not given \maketitle will produce a warning message.
8 \DeclareRobustCommand*\author[1]{\gdef\@author{#1}}

(End definition for \author.)

\date \date for use in \maketitle. If not given \maketitle will produce \today as the default.
9 \DeclareRobustCommand*\date[1]{\gdef\@date{#1}}

(End definition for \date.)

\thanks
10 \DeclareRobustCommand\thanks[1]{\footnotemark
11 \protected@xdef\@thanks{\@thanks
12 \protect\footnotetext[\the\c@footnote]{#1}}%
13 }

(End definition for \thanks.)
```

`\and`

```
14 \DeclareRobustCommand\and{%    % \begin{tabular}
15   \end{tabular}}%
16   \hskip 1em \@plus.17fil%
17   \begin{tabular}[t]{c}}%      % \end{tabular}
```

(End definition for \and.)

```
18 </2ekernel | latexrelease>
19 <latexrelease>\EndIncludeInRelease
20 <latexrelease>\IncludeInRelease{0000/00/00}%
21 <latexrelease>                {\title}{Make commands robust}%
22 <latexrelease>
23 <latexrelease>\kernel@make@fragile\title
24 <latexrelease>\kernel@make@fragile\author
25 <latexrelease>\kernel@make@fragile\date
26 <latexrelease>\kernel@make@fragile\thanks
27 <latexrelease>\kernel@make@fragile\and
28 <latexrelease>
29 <latexrelease>\EndIncludeInRelease
30 <*2ekernel>
```

`\@title`

```
31 \def\@title{\@latex@error{No \noexpand\title given}\@ehc}
```

(End definition for \@title.)

`\@author`

```
32 \def\@author{\@latex@warning@no@line{No \noexpand\author given}}
```

(End definition for \@author.)

`\@date`

```
33 \gdef\@date{\today}
```

(End definition for \@date.)

`\@thanks`

```
34 \let\@thanks\@empty
```

(End definition for \@thanks.)

```
35 \message{sectioning,}
```

1.2 Sectioning

`\@secpenalty`

```
36 \newcount\@secpenalty
37 \@secpenalty = -300
```

(End definition for \@secpenalty.)

`\if@noskipsec` Way back in 1991 (08/26) FMi & RmS set the `\@noskipsec` switch to true for the
`\@noskipsectrue` preamble and to false in `\document`. This was done to trap lists and related text in the
preamble but it does not catch everything.

```
38 \newif\if@noskipsec \@noskipsectrue
```

(End definition for \if@noskipsec and \@noskipsectrue.)

\@startsection The `\@startsection{<name>}{<level>}{<indent>}{<before skip>}{<after skip>}{<style>}`*[`<altheading> <heading>`] command is the mother of all the user level sectioning commands. The part after the *, including the * is optional.

name: e.g., 'subsection'

level: a number, denoting depth of section – e.g., chapter = 0, section = 1, etc.

indent: Indentation of heading from left margin

before skip: Absolute value = skip to leave above the heading. If negative, then paragraph indent of text following heading is suppressed.

after skip: if positive, then skip to leave below heading, else negative of skip to leave to right of run-in heading.

style: Commands to set style. Since June 1996 release the *last* command in this argument may be a command such as `\MakeUppercase` or `\fbox` that takes an argument. The section heading will be supplied as the argument to this command. So setting #6 to, say, `\bfseries\MakeUppercase` would produce bold, uppercase headings.

If '*' is missing, then increment the counter. If it is present, then there should be no [`<altheading>`] argument. The command uses the counter 'secnumdepth'. It contains a pointer to the highest section level that is to be numbered.

Warning: The `\@startsection` command should be at the same or higher grouping level as the text that follows it. For example, you should *not* do something like

```
\def\foo{ \begingroup ...
           \paragraph{...}
           \endgroup}
```

Pseudocode for the `\@startsection` command *Historical L^AT_EX 2.09 comments* (not necessarily accurate any more):

147 `\let\subparagraphmark\@gobble`

(End definition for `\sectionmark` and others.)

148 `\message{contents,}`

1.3 Table of Contents etc.

1.3.1 Convention

`\tf@<foo>` = file number for output for table foo. The file is opened only if `@files` = true.

1.3.2 Commands

A `\l@<type>{<entry>}{<page>}` Macro needs to be defined by document style for making an entry of type `<type>` in a table of contents, etc. E.g., the document style should define `\l@chapter`, `\l@section`, etc.

Note: When the `\protect` command is used in the `<entry>` or `<text>` of one of the commands below, it causes the following control sequence to be written on the file without being expanded. The sequence will be expanded when the table of contents entry is processed.

Surprise: Inside an `\addcontentsline` or `\addtocontents` command argument, the commands: `\index`, `\glossary`, and `\label` are no-ops. This could cause a problem if the user puts an `\index` or `\label` into one of the commands he writes, or into the optional ‘short version’ argument of a `\section` or `\caption` command.

`\@starttoc` The `\@starttoc{<ext>}` command is used to define the commands: `\tableofcontents`, `\listoffigures`, etc.

For example: `\@starttoc{lof}` is used in `\listoffigures`. This command reads the `.<ext>` file and sets up to write the new `.<ext>` file.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

`\@starttoc{EXT} ==`

```

BEGIN
  \begingroup
  \makeatletter
  read file \jobname.EXT
  IF @filesw = true
    THEN open \jobname.EXT as file \tf@EXT
  FI
  @nobreak :=G FALSE %% added 24 May 89
\endgroup
END

```

End of historical L^AT_EX 2.09 comments.

```

149 \def\@starttoc#1{%
150   \begingroup
151   \makeatletter
152   \@input{\jobname.#1}%
153   \if@filesw
154     \expandafter\newwrite\csname tf@#1\endcsname
155     \immediate\openout \csname tf@#1\endcsname \jobname.#1\relax
156   \fi
157   \@nobreakfalse
158   \endgroup}

```

(End definition for \@starttoc.)

\addcontentsline The `\addcontentsline{<table>}{<type>}{<entry>}` command allows the user to add his/her own entry to a table of contents, etc. The command adds the entry `\contentsline{<type>}{<entry>}{<page>}` to the `.<table>` file.

This macro is implemented as an application of `\addtocontents`. Note that `\thepage` is not expandable during `\protected@write` therefore one gets the page number at the time of the `\shipout`.

```

159 </2kernel>
160 < *2kernel | latexrelease>
161 < latexrelease> \IncludeInRelease{2020/10/01}%
162 < latexrelease> { \addcontentsline}{fourth argument}%
163 \def\addcontentsline#1#2#3{%

183     {\string\@writefile{#1}{#2}}}

```

(End definition for \addtocontents.)

\contentsline The `\contentsline{<type>}{<entry>}{<page>}` macro produces a `<type>` entry in a table of contents, etc. It will appear in the `.toc` or other file. For example, The entry for subsection 1.4.3 in the table of contents for example, might be produced by:

```

\contentsline{subsection}
  {\makebox{30pt}[r]{1.4.3} Gnats and Gnus}{22}

```

The `\protect` command causes command sequences to be written without expanding them.

```

184 \def\contentsline#1{\csname l@#1\endcsname}

```

(End definition for \contentsline.)

`\dottedtocline{<level>}{<indent>}{<numwidth>}{<title>}{<page>}`: Macro to produce a table of contents line with the following parameters:

level If `<level> > \c@tocdepth`, then no line produced.

indent Total indentation from the left margin.

numwidth Width of box for number if the `<title>` has a `\numberline` command. As of 25 Jan 1988, this is also the amount of extra indentation added to second and later lines of a multiple line entry.

title Contents of entry.

page Page number.

Uses the following parameters, which must be set by the document style. They should be defined with `\def`'s.

pnumwidth Width of box in which page number is set.

tocrmarg Right margin indentation for all but last line of multiple-line entries.

dotsep Separation between dots, in mu units. Should be `\def`'d to a number like 2 or 1.7

lfloat.dtx

1 Floats

The different types of floats are identified by a $\langle type \rangle$ name, which is the name of the counter for that kind of float. For example, figures are of type ‘figure’ and tables are of type ‘table’. Each $\langle type \rangle$ has associated a positive $\langle type\ number \rangle$, which is a power of two. E.g., figures might have type number 1, tables type number 2, programs type number 4, etc.

The locations where a float can go are specified by a $\langle placement\ specifier \rangle$, which is a list of the possible locations, each denoted by a letter as follows:

h : here	— at the current location in the text.
t : top	— at the top of a text page.
b : bottom	— at the bottom of a text page.
p : page	— on a separate float page

In addition, in conjunction with these, you can use ‘!’ which means that the current values of the float positioning parameters are ignored for this float. (Has no effect on ‘p’, float page positioning.) For example, ‘pht’ specifies that the float can appear in any of three locations: page, here or top.

1.1 Floating Environments

```
1 \*2kernel
2 \message{floats,}
```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

Where floats may appear on a page, and how many may appear there are specified by the following float placement parameters. The numbers are named like counters so the user can set them with the ordinary counter-setting commands.

<code>\c@topnumber</code>	: Number of floats allowed at the top of a column.
<code>\topfraction</code>	: Fraction of column that can be devoted to floats.
<code>\c@dbltopnumber, \dbltopfraction</code>	: Same as above, but for double-column floats.
<code>\c@bottomnumber, \bottomfraction</code>	: Same as above for bottom of page.
<code>\c@totalnumber</code>	: Number of floats allowed in a single column, including in-text floats.
<code>\textfraction</code>	: Minimum fraction of column that must contain text.
<code>\floatpagefraction</code>	: Minimum fraction of page that must be taken up by float page.
<code>\dblfloatpagefraction</code>	: Same as above, for double-column floats.

The document style must define the following.

`\fps@TYPE` : The default placement specifier for floats of type TYPE.

`\ftype@TYPE` : The type number for floats of type TYPE.

`\ext@TYPE` : The file extension indicating the file on which the contents list for float type TYPE is stored.
For example, `\ext@figure = 'lof'`.

`\fnum@TYPE` : A macro to generate the figure number for a caption.
For example, `\fnum@TYPE == Figure \thefigure`.

`\@makecaption{NUM}{TEXT}` :
A macro to make a caption, with NUM the value produced by `\fnum@...` and TEXT the text of the caption. It can assume it's in a `\parbox` of the appropriate width.

`\@float{TYPE}[PLACEMENT]` : This macro begins a float environment for a single-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is defined by `\fps@TYPE`. The environment is ended by `\end@float`.
E.g., `\figure == \@float{figure}, \endfigure == \end@float`.

```
\@float{TYPE}[PLACEMENT] ==
BEGIN
  if hmode then \@bsphack
    \@floatpenalty := -10002
  else \@floatpenalty := -10003
  fi
  \@captype ==L TYPE
  \@dblflset
  \@fps ==L PLACEMENT
  \@onelevel@sanitize \@fps
  add default PLACEMENT if at most ! in PLACEMENT ==
\@fpsadddefault
  if inner
    then LaTeX Error: 'Not in outer paragraph mode.'
    \@floatpenalty := 0
  else if \@freelist nonempty
    then \@currbox :=L head of \@freelist
    \@freelist :=G tail of \@freelist
    \count\@currbox :=G 32*\ftype@TYPE +
                                bits determined by PLACEMENT
    else \@floatpenalty := 0
    LaTeX Error: 'Too many unprocessed floats'
  fi
fi
\@currbox :=G \color@vbox
```

```

\normalcolor
\ vbox{
  %% 15 Dec 87 -
  %% removed \boxmaxdepth :=L 0pt
  %% that made box 0 depth because it screwed
  %% things up. Instead, added \vskip0pt at end
  \hsize = \columnwidth
  \@parboxrestore
  \@floatboxreset
END

```

```

\caption ==
BEGIN
  \refstepcounter{\@capttype}
  \@dblarg{\@caption{\@capttype}}
END

```

In following definition, `\par` moved from after `\addcontentsline` to before `\addcontentsline` because the `\write` could cause an extra blank line to be added to the paragraph above the caption. (Change made 12 Jun 87)

```

\@caption{TYPE}[STEXT]{TEXT} ==
BEGIN
  \par
  \addcontentsline{\ext@TYPE}{TYPE}{\numberline{\theTYPE}{STEXT}}
  \begingroup
    \@parboxrestore
    \@normalsize
    \@makecaption{\fnum@TYPE}{TEXT}
  \par
  \endgroup
END

```

`\@dblfloat{TYPE}[PLACEMENT]` : Macro to begin a float environment for a double-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is 'tp'

The environment is ended by `\end@dblfloat`.

E.g., `\figure* == \@dblfloat{figure}`,

`\endfigure* == \end@dblfloat`.

```

\@dblfloat{TYPE}[PLACEMENT] ==
  Identical to \@float{TYPE}[PLACEMENT] except \hsize and \linewidth
  are set to \textwidth.

```

End of historical L^AT_EX 2.09 comments.

`\@floatpenalty`

```

3 \newcount\@floatpenalty

```

(End definition for \@floatpenalty.)

`\caption` This is set to be an error message outside a float since no `captype` is defined there; this may need to be changed by some classes.

```

4 \def\caption{%
5   \ifx\@captype\@undefined
6     \latexerror{\noexpand\caption outside float}\@ehd
7     \expandafter\@gobble
8   \else
9     \refstepcounter\@captype
10    \expandafter\@firstofone
11  \fi
12  {\@dblarg{\@caption\@captype}}%
13 }
```

(End definition for \caption.)

`\@caption`

```

14 \long\def\@caption#1[#2]#3{%
15   \par
16   \addcontentsline{\csname ext@#1\endcsname}{#1}%
17   {\protect\numberline{\csname the#1\endcsname}{\ignorespaces #2}}%
18   \begingroup
```

The paragraph setting parameters are normalised at this point, however `\@parboxrestore` resets `\everypar` which is not correct in this context so `\@setminipage` is called if needed.

The float mechanism, like `minipage`, sets the flag `@minipage` true before executing the user-supplied text. Many L^AT_EX constructs test for this flag and do not add vertical space when it is true. The intention is that this emulates T_EX's ‘top of page’ behaviour. The flag must be set false at the start of the first paragraph. This is achieved by a redefinition of `\everypar`, but the call to `\@parboxrestore` removes that redefinition, so it is re-inserted if needed. If the flag is already false then the `\caption` was not the first entry in the float, and so some other paragraph has already activated the special `\everypar`. In this case no further action is needed.

```

19   \@parboxrestore
20   \if@minipage
21     \@setminipage
22   \fi
23   \normalsize
24   \@makecaption{\csname fnum@#1\endcsname}{\ignorespaces #3}\par
25   \endgroup
```

(End definition for \@caption.)

`\@float`
`\@dblflset`

```

26 \def\@float#1{%
27   \@ifnextchar[%
28     {\@xfloat{#1}}%
29     {\edef\reserved@a{\noexpand\@xfloat{#1}[\csname fps@#1\endcsname]}}%
30     \reserved@a}}
```

(End definition for \@float and \@dblflset.)

`\@dblfloat`

```

31 \def\@dblfloat{%
32   \if@twocolumn\let\reserved@a\@dblft\else\let\reserved@a\@float\fi
33   \reserved@a}
```

(End definition for \dblfloat.)

\fps@dbl Note that all double floats have default fps ‘tp’.

(End definition for \fps@dbl.)

\@setfps This sets the fps, dealing with error conditions by adding the default.

(End definition for \@setfps.)

\@xfloat The first part of this sets the count register that stores all the information about the type and fps of the float.

We assume here that the default specifiers already contain no active characters.

It may be better to store the defaults as numbers, rather than symbol strings.

```

```

The remainder sets up the box in which the float is typeset, and the typesetting environment to be used. It is essential to have the extra box to avoid the unwanted space that would otherwise often be put at the top of the float.

It ends with a hook; not sure how useful this is but it is needed at present to deal with double-column floats.

\@floatboxreset The rationale for allowing these normally global flags to be set locally here, via **\@parboxrestore**, was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in **\set@nobreak**; otherwise this command will be redundant.

(End definition for `\dblfloatplacement`.)

Historical *L^AT_EX* 2.09 comments (not necessarily accurate any more):

MARGINAL NOTES:

Marginal notes use the same mechanism as floats to communicate with the `\output` routine. Marginal notes are distinguished from floats by having a negative placement specification. The command `\marginpar [LTEXT]{RTEXT}` generates a marginal note in a parbox, using LTEXT if it's on the left and RTEXT if it's on the right. (Default is RTEXT = LTEXT.) It uses the following parameters.

`\marginparwidth` : Width of marginal notes.
`\marginparsep` : Distance between marginal note and text.
the page layout to determine how to move the marginal
note into the margin. E.g., `\@leftmargin skip ==`
`\hskip -\marginparwidth \hskip -\marginparsep` .
`\marginparpush` : Minimum vertical separation between `\marginpar`'s

Marginal notes are normally put on the outside of the page if `@mparswitch = true`, and on the right if `@mparswitch = false`. The command `\reversemarginpar` reverses the side where they are put. `\normalmarginpar` undoes `\reversemarginpar`. These commands have no effect for two-column output.

SURPRISE: if two marginal notes appear on the same line of text, then the second one could appear on the next page, in a funny position.

```

1.2 Footnotes

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

`\footnote{NOTE}` : User command to insert a footnote.

`\footnote[NUM]{NOTE}`: User command to insert a footnote numbered *NUM*, where *NUM* is a number – 1, 2, etc. For example, if footnotes are numbered *, **, etc. within pages, then `\footnote[2]{...}` produces footnote ‘**’. This command does not step the footnote counter.

`\footnotemark[NUM]` : Command to produce just the footnote mark in the text, but no footnote. With no argument, it steps the footnote counter before generating the mark.

`\footnotetext[NUM]{TEXT}` : Command to produce the footnote but no mark. `\footnote` is equivalent to `\footnotemark \footnotetext` .

As in PLAIN, footnotes use `\insert\footins`, and the following parameters:

`\footnotesize` : Size-changing command for footnotes.

`\footnotesep` : The height of a strut placed at the beginning of every footnote.

`\skip\footins` : Space between main text and footnotes. The rule separating footnotes from text occurs in this space. This space lies above the strut of height `\footnotesep` which is at the beginning of the first footnote.

`\footnoterule` : Macro to draw the rule separating footnotes from text. It is executed right after a `\vspace` of `\skip\footins`. It should take zero vertical space—i.e., it should to a negative skip to compensate for any positive space it occupies. (See PLAIN.TEX.)

`\interfootnotelinepenalty` : Interline penalty for footnotes.

`\thefootnote` : In usual LaTeX style, produces the footnote number. If footnotes are to be numbered within pages, then the document style file must include an `\@addtoreset` command to cause the footnote counter to be reset when the page counter is stepped. This is not a good idea, though, because the counter will not always be reset in time to ensure that the first footnote on a page is footnote number one.

`\@thefnmark` : Holds the current footnote's mark—e.g., `\dag` or `'1'` or `'a'`.

`\@mpfnnumber` : A macro that generates the numbers for `\footnote` and `\footnotemark` commands. It == `\thefootnote` outside a minipage environment, but can be changed inside to generate numbers for `\footnote`'s.

`\@makefnmark` : A macro to generate the footnote marker from `\@thefnmark`. The default definition was `\hbox{$\@thefnmark$}`.

This is now replaced by `\@thefnmark`

`\@makefntext{NOTE}` :
 Must produce the actual footnote, using `\@thefnmark` as the mark of the footnote and `NOTE` as the text. It is called when effectively inside a `\parbox`, with `\hsize = \columnwidth`.
 For example, it might be as simple as
`$\@thefnmark$ NOTE`

In a minipage environment, `\footnote` and `\footnotetext` are redefined so that

- (a) they use the counter `mpfootnote`
- (b) the footnotes they produce go at the bottom of the minipage.

The switch is accomplished by letting `\@mpfn == footnote` or `mpfootnote` and `\thempfn == \thefootnote` or `\thempfootnote`, and by redefining `\@footnotetext` to be `\@mpfootnotetext` in the minipage.

```

\footnote{NOTE} ==
BEGIN
  \stepcounter{\@mpfn}
  begingroup
    \protect == \noexpand
    \@thefnmark :=G eval (\thempfn)
  endgroup
  \@footnotemark

1 Index and Glossary Generation

Index and Glossary commands.

<code>\makeindex</code>	A preamble command to turn on indexing.
<code>\makeglossary</code>	A preamble command to turn on making glossary entries.
<code>\index</code>	Make an index entry for #1.
<code>\glossary</code>	Make a glossary entry for #1.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
\makeindex ==
  BEGIN
    \index == BEGIN \@bsphack
                \begingroup
                \protect{X} == \string X\space
                %% added 3 Feb 87 for \index commands
                %% in \footnotes
                re-\catcode special characters
                to 'other'
                \@wrindex

  END

\@wrindex{ITEM} ==
  BEGIN
    write of {\indexentry{ITEM}{page number}}
  \endgroup
  \@esphack
  END

INITIALIZATION:

\index == BEGIN \@bsphack
          \begingroup
          re-\catcode special characters (in case '%' there)
          \@index

  END

\@index{ITEM} == BEGIN \endgroup \@esphack END
```

Changes made 14 Apr 89 to write `\glossaryentry`'s instead of
`\indexentry`'s on the .glo file.

ltbibl.dtx

1 Bibliography Generation

A bibliography is created by the `thebibliography` environment, which generates a title such as “References”, and a list of entries. The `BIBTEX` program will create a file containing such an environment, which will be read in by the `\bibliography` command. With `BIBTEX`, the following commands will be used.

<code>\bibliography</code>	<code>\bibliography{<file1,file2, ...,filen>}</code> : specifies the bibdata files. Writes a <code>\bibdata</code> entry on the <code>.aux</code> file and tries to read in <code>mainfile.bbl</code> .
<code>\bibliographystyle</code>	<code>\bibliographystyle{<style>}</code> : Writes a <code>\bibstyle</code> entry on the <code>.aux</code> file.
<code>thebibliography</code>	The <code>thebibliography</code> environment is a list environment. To save the use of an extra counter, it should use <code>enumiv</code> as the item counter. Instead of using <code>\item</code> , items in the bibliography are produced by the following commands:

`\bibitem{<name>}` : Produces a numbered entry cited as `<name>`.

`\bibitem[<label>]{<name>}` : Produces an entry labeled by `<Label>` and cited by `<name>`.

The former is used for bibliographies with citations like [1], [2], etc.; the latter is used for citations like [Knuth82].

The document class must define the `thebibliography` environment. This environment has a single argument, which is the widest bibliography label— e.g., if the [Knuth67] is the widest entry, then this argument will be Knuth67. The `\thebibliography` command must begin a list environment, which the `\endthebibliography` command ends.

<code>\cite</code>	Entries are cited by the command <code>\cite{<name>}</code> .
<code>\nocite</code>	<code>\nocite{< citations>}</code> puts information on the <code>.aux</code> file that causes <code>BIBTEX</code> to include the <code>{< citations>}</code> list in the bibliography, but puts nothing in the text.

`\nocite{*}` is special: it tells `BIBTEX` to put the whole of a collection of references into the bibliography.

```
1 <*2kernel>
2 \message{bibliography,}
```

Historical \LaTeX 2.09 comments (not necessarily accurate any more):

PARAMETERS

`\@cite` : A macro such that `\@cite{LABEL1,LABEL2}{NOTE}` produces the output for a `\cite[NOTE]{FOO1,FOO2}` command, where entry `FOOi` is defined by `\bibitem[LABELi]{FOOi}`.

The switch `@tempswa` is true if the optional `NOTE` argument is present.

The default definition is :

```
\@cite{LABELS}{NOTE} ==
  BEGIN [LABELS
    IF @tempswa = T THEN , NOTE FI
  ]
END
```

`\@biblabel` : A macro to produce the label in the bibliography entry. For `\bibitem[LABEL]{NAME}`, the label is

generated by \@biblabel{LABEL}. It has the default definition \@biblabel{LABEL} -> [LABEL].

CONVENTION

\b@F00 : The name or number of the reference created by \cite{FOO}
E.g., if \cite{FOO} -> [17] , then \b@F00 -> 17.

(End definition for \cite.)

\@citex \penalty\@m added to definition of \@citex to allow a line break after the ‘,’ in citations like [Jones80,Smith77] (Added 23 Oct 86)
space added after the ‘,’ (21 Nov 87)

```
14 \def\@citex[#1]#2{\leavevmode
15     \let\@citea\@empty
16     \@cite{\@for\@citeb:=#2\do
17         {\@citea\def\@citea{\penalty\@m\ }%
18          \edef\@citeb{\expandafter\@firstofone\@citeb\@empty}}%
19     \if@filesw\immediate\write\@auxout{\string\citation{\@citeb}}\fi}
```

Using `\hbox` instead of `\mbox` is fine because of the `\leavevmode` above. In fact the use of a box around the citation contents is more than questionable in my view (FMi), but within 2e I have to keep that for compatibility reasons as it would probably change too many existing documents. Its main reason is to avoid hyphenation of labels such as [FOOB89] into [FOO- B89] so in certain styles it makes sense; but, for example, in author year citations it becomes more than questionable.

So Chris added yet another hook here, as suggested by, at least, Donald Arseneau. Note that this one is inside the first argument of the `\@cite` hook. This decouples the top-level typesetting of the citation from the details of the other business conducted here. All this really needs a complete rethink to get the right modularity.

```

38   \fi}}

```

(End definition for \bibliographystyle.)

`\nocite` (Added 14 Jun 85)

This puts information on the `.aux` file that causes `BIBTEX` to include the citation list in the bibliography, but puts nothing in the text.

RmS 93/08/06: Made loop for `\nocite` like that for `\@citex`, to get rid of leading spaces.

```

39 \</2ekernel>
40 \< *2ekernel | latexrelease>
41 \< latexrelease>\IncludeInRelease{2021/05/01}%
42 \< latexrelease>          {\nocite}{Allow nocite in preamble}%
43 \def\nocite#1{\@bsphack

```

With the implementation designed already in L^AT_EX 2.09 the `\nocite` command will not work before `\begin{document}` since it tries to write to the `.aux` file which is not open before that point. As a result the “reference” will appear on the terminal and nothing else will happen.

[This would be easy to fix, but then a document using the fix will silently fail on an older release of L^AT_EX, missing all citations done with `\nocite`. Thus we do only generate an error message and leave the fix for a L^AT_EX 2_ε successor.]

Given that we are now a quarter century into using L^AT_EX 2_ε there is no good reason any more do limit ourself to 2.09 considerations. So we now simply delay the `\nocite` if it is issued in the preamble.

```
44 \ifx\@onlypreamble\document
```

Since we are after `\begin{document}` we can do the citations:

```
45 \for\@citeb:=#1\do{%
46   \edef\@citeb{\expandafter\@firstofone\@citeb}%
47   \if@files\immediate\write\@auxout{\string\citation{\@citeb}}\fi
48   \ifundefined{b@\@citeb}{\G@refundefinedtrue
49     \latex@warning{Citation ‘\@citeb’ undefined}}{}}%
50 \else
```

But before `\begin{document}` we raised an error message in the past but as of 2021/05 not any longer.

```
51 % \latex@error{Cannot be used in preamble}\@eha
```

Instead we delay the declaration to the start of the document. We have to use a late hook for this, so that it comes after the `.aux` file is open for writing and after `\@preamblecmds` was executed to change the above test. Therefore `\AtBeginDocument` would still be too early.

```
52 \AddToHook{begindocument/end}[kernel]{\nocite{#1}}%
53 \fi
54 \esphack}
55 </2kernel | latexrelease>
56 <latexrelease>\EndIncludeInRelease
57 <latexrelease>\IncludeInRelease{0000/00/00}%
58 <latexrelease> \nocite{Allow nocite in preamble}%
59 <latexrelease>
60 <latexrelease>\def\nocite#1{\@bsphack
61 <latexrelease> \ifx\@onlypreamble\document
62 <latexrelease> \for\@citeb:=#1\do{%
63 <latexrelease> \edef\@citeb{\expandafter\@firstofone\@citeb}%
64 <latexrelease> \if@files\immediate\write\@auxout{\string\citation{\@citeb}}\fi
65 <latexrelease> \ifundefined{b@\@citeb}{\G@refundefinedtrue
66 <latexrelease> \latex@warning{Citation ‘\@citeb’ undefined}}{}}%
67 <latexrelease> \else
68 <latexrelease> \latex@error{Cannot be used in preamble}\@eha
69 <latexrelease> \fi
70 <latexrelease> \esphack}
71 <latexrelease>
72 <latexrelease>\EndIncludeInRelease
73 <*/2kernel>
```

Since `\nocite{*}` should not produce a warning about undefined citation keys (see PR 557), we need to set the control sequence `‘\b@*’` to something other than `\relax`. As

a result `\cite{*}` will not warn either (but that never worked with \LaTeX in the first place).

```
74 \expandafter\let\csname b@*\endcsname\@empty
```

(End definition for \nocite.)

1.1 Default definitions

This hook determines the ‘relative formatting’ of the two logical parts of a citation with comment.

`\@cite`

```
75 \def\@cite#1#2{{\if@tempswa , #2\fi}}
```

(End definition for \@cite.)

`\@cite@ofmt` This is, in general, a command that appears to have one argument whose value is, in the kernel, a single cs whose name is the expansion of `b@ \@citeb`; the expansion of this cs will typically be some hmode material that produces the detailed typeset form of just the citations themselves.

```
76 \let\@cite@ofmt\hbox
```

(End definition for \@cite@ofmt.)

`\@biblabel`

```
77 \def\@biblabel#1{[#1]}
```

```
78 \</2ekernel>
```

(End definition for \@biblabel.)

ltpage.dtx

1 Page styles and related commands

1.1 Page Style Commands

`\pagestyle{<style>}` : sets the page style of the current and succeeding pages to *style*

`\thispagestyle{<style>}` : sets the page style of the current page only to *style*.

To define a page style *style*, you must define `\ps@style` to set the page style parameters.

1.2 How a page style makes running heads and feet

The `\ps@...` command defines the macros `\@oddhead`, `\@oddfoot`, `\@evenhead`, and `\@evenfoot` to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands `\chaptermark`, `\sectionmark`, etc., where `\chaptermark{<text>}` is called by `\chapter` to set a mark. The `\...mark` commands and the `\...head` macros are defined with the help of the following macros.

(All the `\...mark` commands should be initialized to no-ops.)

1.3 marking conventions

L^AT_EX extends T_EX's `\mark` facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

`\markboth{<left>}{<right>}` : Adds both marks.

`\markright{<right>}` : Adds a 'right' mark.

`\leftmark` : Used in the output routine, gets the current 'left' mark. Works like T_EX's `\botmark`.

`\rightmark` : Used in the output routine, gets the current 'right' mark. Works like T_EX's `\firstmark`. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a `\chapter` command and the right mark is changed by a `\section` command. However, it does produce somewhat anomalous results if 2 `\markboth`'s occur on the same page.

Commands like `\tableofcontents` that should set the marks in some page styles use a `\@mkboth` command, which is `\let` by the `\pagestyle` command (`\ps@...`) to `\markboth` for setting the heading or to `\@gobbletwo` to do nothing.

1 `<*2ekernel>`

`\pagestyle` User command to set the page style for this and following pages.

```
2 \def\pagestyle#1{%
3   \@ifundefined{ps@#1}%
4     \undefinedpagestyle
5     {\@nameuse{ps@#1}}}
```

(End definition for `\pagestyle`.)

`\thispagestyle` User command to set the page style for this page only.

```
6 \def\thispagestyle#1{%
7   \ifundefined{ps@#1}%
8     \undefinedpagestyle
9     {\global\@specialpagetrue\gdef\@specialstyle{#1}}
```

(End definition for `\thispagestyle`.)

`\ps@empty` The empty page style: No head or foot line.

```
10 \def\ps@empty{%
11   \let\@mkboth\@gobbletwo\let\@oddhead\@empty\let\@oddfoot\@empty
12   \let\@evenhead\@empty\let\@evenfoot\@empty}
```

(End definition for `\ps@empty`.)

`\ps@plain` The plain page style: No head, centred page number in foot.

```
13 \def\ps@plain{\let\@mkboth\@gobbletwo
14   \let\@oddhead\@empty\def\@oddfoot{\reset@font\hfil\thepage
15   \hfil}\let\@evenhead\@empty\let\@evenfoot\@oddfoot}
```

(End definition for `\ps@plain`.)

`\@leftmark` We implement `\@leftmark` and `\@rightmark` in terms of already defined commands to save token space. We can't get rid of them since they are sometimes used in applications.

```
16 \let\@leftmark\@firstoftwo
17 \let\@rightmark\@secondoftwo
```

(End definition for `\@leftmark` and `\@rightmark`.)

```
18 </2ekernel>
19 <*2ekernel | latexrelease>
20 <latexrelease>\IncludeInRelease{2019/10/01}%
21 <latexrelease>           {\markboth}{Make commands robust}%
```

`\markboth` User commands for setting L^AT_EX marks.

`\markright` Test for `\@nobreak` added 15 Apr 86 in `\markboth` and `\markright` letting `\label` and `\index` to `\relax` added 22 Feb 86 so these commands can appear in sectioning command arguments RmS 91/06/21 Same for `\glossary`

```
22 \DeclareRobustCommand*\markboth[2]{%
23   \begingroup
24     \let\label\relax \let\index\relax \let\glossary\relax
25     \unrestored@protected@xdef\@themark {{#1}{#2}}%
26     \@temptokena \expandafter{\@themark}%
27     \mark{\the\@temptokena}%
28   \endgroup
29   \if@nobreak\ifvmode\nobreak\fi\fi}
```

```
30 \DeclareRobustCommand*\markright[1]{%
31   \begingroup
32     \let\label\relax \let\index\relax \let\glossary\relax
```

Protection is handled inside `\@markright`.

```
33   \expandafter\@markright\@themark {#1}%
34   \@temptokena \expandafter{\@themark}%
35   \mark{\the\@temptokena}%
36 \endgroup
37 \if@nobreak\ifvmode\nobreak\fi\fi}
```

```

(End definition for \markboth and \markright.)

63 \def\endsloppypar{\par}

```

\fussy Resets T_EX's parameters to their normal finicky values.

```

64 \DeclareRobustCommand\fussy{%
65   \emergencystretch\z@
66   \tolerance 200%
67   \hfuzz .1\p@
68   \vfuzz\hfuzz}

```

(End definition for \fussy.)

\overfullrule L^AT_EX default is no overfull box rule. Changed by document class option.

```

69 \overfullrule 0pt

```

(End definition for \overfullrule.)

```

70 </2ekernel>

```

File Q

ltclass.dtx

1 Introduction

This file implements the following declarations, which replace `\documentstyle` in $\text{\LaTeX} 2_{\epsilon}$ documents.

Note that old documents containing `\documentstyle` will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of ‘style files’: ‘class files’ which define elements and provide a default formatting for them; and ‘packages’ which provide extra functionality. One difference between $\text{\LaTeX} 2_{\epsilon}$ and $\text{\LaTeX} 2.09$ is that $\text{\LaTeX} 2_{\epsilon}$ packages may have options. Note that options to classes/packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

2 User interface

`\documentclass[<main-option-list>]{<class>}[<version>]`

There must be exactly one such declaration, and it must come first. The *<main-option-list>* is a list of options which can modify the formatting of elements which are defined in the *<class>* file as well as in all following `\usepackage` declarations (see below). The *<version>* is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the class is found, a warning is issued.

`\documentstyle[<main-option-list>]{<class>}[<version>]`

The `\documentstyle` declaration is kept in order to maintain upward compatibility with $\text{\LaTeX} 2.09$ documents. It is similar to `\documentclass`, but it causes all options in *<main-option-list>* that the *<class>* does not use to be passed to `\RequirePackage` after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in $\text{\LaTeX} 2.09$ compatibility mode. As far as most packages are concerned, this only affects the warnings and errors \LaTeX generates. This flag does affect the definition of font commands, and `\sloppy`.

`\usepackage[<package-option-list>]{<package-list>}[<version>]`

There can be any number of these declarations. All packages in *<package-list>* are called with the same options.

Each *<package>* file defines new elements (or modifies those defined in the *<class>*), and thus extends the range of documents which can be processed. The *<package-option-list>* is a list of options which can modify the formatting of elements defined in the *<package>* file. The *<version>* is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

As well as processing the options given in the *<package-option-list>*, each package processes the *<main-option-list>*. This means that options that affect all of the packages can be given globally, rather than repeated for every package.

`filecontents`

Note that class files have the extension `.cls`, packages have the extension `.sty`.

The environment `filecontents` is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a ‘current directory’ or ‘default directory’) then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The environment can also be called with an optional argument which is used to alter some of its behavior: option `force` or `overwrite` will allow for overwriting existing files, option `nosearch` will only check the current directory when looking if the file exists. This can be useful if you want to generate a local (modified) copy of some file that is already in the search tree of \TeX . Finally, you can use `noheader` to prevent it from writing the standard blurb at the top of the file (this is actually the same as using the star form of the environment).

The environment is now allowed anywhere in the document, but to ensure that all packages or options necessary are available when the document is run, it is normally best to place it at the top of your file (before `\documentclass`). A possible use case for using it inside the document body is if you want to reuse some text several times in the document you could then write it and later use `\input` to retrieve it where needed.

The begin and end tags should each be on a line by itself.

2.1 Option processing

When the options are processed, they are divided into two types: *local* and *global*:

- For a class, the options in the `\documentclass` command are local.
- For a package, the options in the `\usepackage` command are local, and the options in the `\documentclass` command are global.

The options for `\documentclass` and `\usepackage` are processed in the following way:

1. The local and global options that have been declared (using `\DeclareOption` as described below) are processed first.

In the case of `\ProcessOptions`, they are processed in the order that they were declared in the class or package.

In the case of `\ProcessOptions*`, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.

2. Any remaining local options are dealt with using the default option (declared using the `\DeclareOption*` declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when `\begin{document}` is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

3 Class and Package interface

3.1 Class name and version

`\ProvidesClass` A class can identify itself with the `\ProvidesClass{<name>}[<version>]` command. The `<version>` should begin with a date in the format YYYY/MM/DD.

3.2 Package name and version

`\ProvidesPackage` A package can identify itself with the `\ProvidesPackage{<name>}[<version>]` command. The `<version>` should begin with a date in the format YYYY/MM/DD.

3.3 Requiring other packages

`\RequirePackage` Packages or classes can load other packages using `\RequirePackage[<options>]{<name>}[<version>]`. If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called.

`\LoadClass` Similar to `\RequirePackage`, but for classes, may not be used in package files.

`\PassOptionsToPackage` Packages can pass options to other packages using:

`\PassOptionsToPackage{<options>}{<package>}`.

`\PassOptionsToClass` This adds the `<options>` to the options list of any future `\RequirePackage` or `\usepackage` command. For example:

```
\PassOptionsToPackage{foo,bar}{fred}
```

is the same as:

```
\RequirePackage[foo,bar,baz]{fred}
```

`\LoadClassWithOptions` `\LoadClassWithOptions{<name>}[<version>]:`

This is similar to `\LoadClass`, but it always calls class `<name>` with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by `\PassOptionsToClass`. `\RequirePackageWithOptions` is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

```
\LoadClassWithOptions{article}
```

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using `\LoadClassWithOptions` is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

In the first case, the `article` class will be called with option `landscape` precisely when the current class is called with this option; but in the second example it will not as in that case `article` is only passed options by the default option handler, which is not used for `landscape` as that option is explicitly declared.

<pre>\@ifpackageloaded \@ifclassloaded \@ifpackagelater \@ifclasslater \@ifpackagewith \@ifclasswith</pre>	<p>To find out if a package has already been loaded, use</p> <pre>\@ifpackageloaded{<package>}{<true>}{<false>}.</pre> <p>To find out if a package has already been loaded with a version equal to or more recent than <code><version></code>, use</p> <pre>\@ifpackagelater{<package>}{<version>}{<true>}{<false>}.</pre> <p>To find out if a package has already been loaded with at least the options <code><options></code>, use</p> <pre>\@ifpackagewith{<package>}{<options>}{<true>}{<false>}.</pre>
------------------------------------------------------------------------------------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

There exists one package that can't be tested with the above commands: the `fontenc` package pretends that it was never loaded to allow for repeated reloading with different options (see `ltoutenc.dtx` for details).

3.4 Declaring new options

Options for classes and packages are built using the same macros.

<pre>\DeclareOption \DeclareOption*</pre>	<p>To define a builtin option, use <code>\DeclareOption{<name>}{<code>}</code>.</p> <p>To define the default action to perform for local options which have not been declared, use <code>\DeclareOption*{<code>}</code>.</p>
-------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Note: there should be no use of

`\RequirePackage`, `\DeclareOption`, `\DeclareOption*` or `\ProcessOptions` inside `\DeclareOption` or `\DeclareOption*`.

Possible uses for `\DeclareOption*` include:

```
\DeclareOption*{}
```

Do nothing. Silently accept unknown options. (This suppresses the usual warnings.)

```
\DeclareOption*{@unkownoptionerror}
```

Complain about unknown local options. (The initial setting for package files.)

```
\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{<pkg-name>}}
```

Handle the current option by passing it on to the package `<pkg-name>`, which will presumably be loaded via `\RequirePackage` later in the file. This is useful for building 'extension' packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.

```
\DeclareOption*{\InputIfFileExists{xx-\CurrentOption.yyy}%
{}%
{\OptionNotUsed}}
```

Handle the option `foo` by loading the file `xx-foo.yyy` if it exists, otherwise do nothing, but declare that the option was not used. Actually the `\OptionNotUsed` declaration is only needed if this is being used in class files, but does no harm in package files.

3.5 Safe Input Macros

<code>\InputIfFileExists</code>	<code>\InputIfFileExists{<file>}{<then>}{<else>}</code> Inputs <code><file></code> if it exists. Immediately before the input, <code><then></code> is executed. Otherwise <code><else></code> is executed.
<code>\IfFileExists</code>	As above, but does not input the file. One thing you might like to put in the <code><else></code> clause is
<code>\@missingfileerror</code>	This starts an interactive request for a filename, supplying default extensions. Just hitting return causes the whole input to be skipped and entering <code>x</code> quits the current run,
<code>\input</code>	This has been redefined from the L ^A T _E X 2.09 definition, in terms of the new commands <code>\InputIfFileExists</code> and <code>\@missingfileerror</code> .
<code>\listfiles</code>	Giving this declaration in the preamble causes a list of all files input via the ‘safe input’ commands to be listed at the end. Any strings specified in the optional argument to <code>\ProvidesPackage</code> are listed alongside the file name. So files in standard (and other non-standard) distributions can put informative strings in this argument.

4 Implementation

	<code>1 <*2ekernel></code>
<code>\if@compatibility</code>	The flag for compatibility mode. <code>2 \newif\if@compatibility</code> (End definition for <code>\if@compatibility</code> .)
<code>\@documentclasshook</code>	This legacy hook is called after the first <code>\documentclass</code> command. It is <i>not</i> integrated with the new 2020 hook management system! By default this checks to see if <code>\@normalsize</code> is undefined, and if so, sets it to <code>\normalsize</code> . <code>3 \def\@documentclasshook{%</code> <code>4 \ifx\@normalsize\undefined</code> <code>5 \let\@normalsize\normalsize</code> <code>6 \fi</code> <code>7 }</code> (End definition for <code>\@documentclasshook</code> .)
<code>\@declaredoptions</code>	This list is automatically built by <code>\DeclareOption</code> . It is the list of options (separated by commas) declared in the class or package file and it defines the order in which the corresponding <code>\ds@<option></code> commands are executed. All local <code><option></code> s which are not declared will be processed in the order defined by the optional argument of <code>\documentclass</code> or <code>\usepackage</code> . <code>8 \let\@declaredoptions\@empty</code> (End definition for <code>\@declaredoptions</code> .)
<code>\@classoptionslist</code>	List of options of the main class. <code>9 \let\@classoptionslist\relax</code> <code>10 \@onlypreamble\@classoptionslist</code> (End definition for <code>\@classoptionslist</code> .)

`\@unusedoptionlist` List of options of the main class that haven't been declared or loaded as class option files.

```

11 \let\@unusedoptionlist\@empty
12 \onlypreamble\@unusedoptionlist

(End definition for \@unusedoptionlist.)

```

`\CurrentOption` Name of current package or option.

```

13 \let\CurrentOption\@empty

(End definition for \CurrentOption.)

```

`\@currpath` Path to the current file if explicitly given.

```

14 </2ekernel>
15 <*2ekernel | latexrelease>
16 <latexrelease>
17 <latexrelease>\IncludeInRelease{2020/10/01}{\@currpath}%

24 <latexrelease>\let\@currpath\@undefined
25 <latexrelease>\EndIncludeInRelease
26 </2ekernel | latexrelease>
27 <*2ekernel>

(End definition for \@currpath.)

```

`\@currname` Name of current package or option.

```

28 \let\@currname\@empty

(End definition for \@currname.)

```

`\@currentx` The current file extension.

```

29 \global\let\@currentx=\@empty

(End definition for \@currentx.)

```

`\@clsextension` The two possible values of `\@currentx`.

`\@pkgextension`

```

30 \def\@clsextension{cls}
31 \def\@pkgextension{sty}
32 \onlypreamble\@clsextension
33 \onlypreamble\@pkgextension

(End definition for \@clsextension and \@pkgextension.)

```

`\@pushfilename` Commands to push and pop the file name and extension.

`\@popfilename` #1 current name.

`\@currnamestack` #2 current extension.
#3 current catcode of @.
#4 Rest of the stack.

```

34 </2ekernel>
35 <*2ekernel | latexrelease>
36 <latexrelease>

```

```

37 <latexrelease>\IncludeInRelease{2020/10/01}{\@pushfilename}%
38 <latexrelease> {Add \@expl@push@filename@@ and \@expl@push@filename@aux@@}%
39 \def\@pushfilename{%

```

The push and pop macros are injected in \@pushfilename and \@popfilename so that they correctly keep track of the hook labels.

This needs cleanup with the expl3 interfaces also playing here, e.g., \@expl@push@filename@@ needs cleanup and (and should probably not have this name either).

```

40 \@expl@push@filename@@
41 \xdef\@currnamestack{%
42   {\@currname}%
43   {\@currentx}%
44   {\the\catcode'\@}%
45   \@currnamestack}%

```

Temporarily add a stack for \@currpath here. This should be integrated in the main file stack eventually, but other packages rely on \@currnamestack having three elements per file, so that isn't a trivial change. The prefix \@kernel@... hopefully discourages people from using it.

```

46 \xdef\@kernel@currpathstack{%
47   {\@currpath}%
48   \@kernel@currpathstack}%
49 \@expl@push@filename@aux@@}
50 <latexrelease>\EndIncludeInRelease

```

The following version of \@pushfilename didn't formally exist in this file, but in the 2020/02/02 release, expl3 was preloaded and it patched \@pushfilename (and \@popfilename) by adding some hooks in there. But rolling back to 2020/02/02, expl3 doesn't patch these macros again, so rolling back has to take those hooks into account. Same goes for \@popfilename.

```

```

(End definition for \OptionNotUsed and \@remove@eq@value.)

\default@ds The default option code. Set by \@onefilewithoptions to either \OptionNotUsed for classes, or \@unknownoptionerror for packages. This may be reset in either case with \DeclareOption*.

```

436 % \let\default@ds\OptionNotUsed

```

(End definition for \default@ds.)

\ProcessOptions \ProcessOptions calls \ds@option for each known package option, then calls \default@ds for each option on the local options list. Finally resets all the declared options to \relax. The empty option does nothing, this has to be reset on the off chance it's set to \relax if an empty element gets into the \@declaredoptions list.

The star form is similar but executes options given in the order specified in the document, not the order they are declared in the file. In the case of packages, global options are executed before local ones.

```

```

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of `@`.

For classes, we can immediately process the file. For other types, `#2` could be a comma separated list, so loop through, processing each one separately.

```

```

We have to sanitise file names, so that something like

```

\usepackage{some/local/path/array}
\usepackage{array}

```

won't load `array.sty` twice. It is remotely possible that those are two different files, but as a matter of principles, we will consider that the base file name uniquely identifies a package, regardless of where it lives. This assumption already holds for file hooks, for example, which address the hook to a file by its base name only.

We'll use `\@expl@@@filehook@set@curr@file@nNN{#1.#4}\reserved@a\reserved@b` to parse the file name and return the `<path>` and `<base+ext>` in separate token lists. Further ahead, most operations use `\@currname` which doesn't have a path attached to it; only few actions prepend `\@currpath` to `\@currname` (namely loading, as we have to respect the given path).

A file substitution isn't followed just yet because at this point we are parsing user input, so the file is still what the user asked for, and not the file actually loaded.

```

```

The command `\ver@<file>.<ext>` is used to signal that a package is already loaded, either because it is in fact loaded, or because its loading was suppressed. In minimal installations, said package may not exist but still have its loading suppressed with `\ver@<file>.<ext>`, so before checking if the file exists we have to check that we do need to load it with `\@ifl@aded`. If we don't, then there's no point in checking for a typo or load-disabling.

```
747 \ifl@ad@ed\@current\@currname
```

If the package is already loaded, check that there were no option clashes:

```
748 {\if@options\@current{\@currname}{#2}}}%
749 {\@latex@error
750   {Option clash for \@cls@pkg\space \@currname}%
751   {The package \@currname\space has already been loaded
752     with options:\MessageBreak
753     \space\space[\@optionlist{\@currname.\@current}]\MessageBreak
754     There has now been an attempt to load it
755     with options:\MessageBreak
756     \space\space[#2]\MessageBreak
757     Adding the global options:\MessageBreak
758     \space\space
759     \@optionlist{\@currname.\@current},#2\MessageBreak
760     to your \noexpand\documentclass declaration may fix this.%
761     \MessageBreak
762     Try typing \space <return> \space to proceed.}}%
763 \@firstofone}%
764 {\makeatletter
```

The next line seems to be necessary for 2.09 compatibility (the way the code is written there) This seems questionable and should be look at as in 2e it is definitely unnecessary at this point!

```
765 \@reset@options
```

First we take the *<name>* and *<ext>* given in the argument and check if the file exists, and issue an error otherwise asking for a correction with `\@missingfileerror`. For checking if the file exists we use `\@currpath` (usually empty) before `\@currname`.

```
766 \IfFileExists{\@currpath\@currname.\@current}{}%
767 {\@missing@onefilewithoptions{#2}}%
```

If `\@currname` is empty (the user replied to the “Enter file name” prompt with *<RETURN>*), so stop here (do `\@popfilename` to pop the item just added above).

This `\@gobble` omits the date check at the end.

```
768 \ifx\@currname\@empty
769 \expandafter\@gobble
770 \else
```

If the file exists, check if it was load-prevented, and otherwise do the bookkeeping with `\@filehook@file@push` then call `\set@curr@file` to set `\@curr@file` (and do any required substitution), then actually load the class/package with `\load@onefile@withoptions`. `\set@curr@file` also needs the file path.

```
771 \@disable@packageload@do{\@currname.\@current}%
772 {\@expl@@@filehook@file@push@@
773 \set@curr@file{\@currpath\@currname.\@current}%
774 \@filehook@set@CurrentFile
```

The `\set@curr@file` line above might have replaced the file, so `\@currname` and `\@current` may no longer hold the actual package being loaded, so in that case we need to update these two token lists (`\@curr@file` holds the file name after replacement, so we parse that).

The requested file is saved in `\@currpkg@reqd` to be used in `\InputIfFileExists` later: if the updated `\@currname` and `\@current` are used we lose track of the substitution, so `\CurrentFile` and `\CurrentFileUsed` will be (incorrectly) the same.

```

775 \expandafter\@swaptwoargs\expandafter
776 {\expandafter{\@currpkg@reqd}}}%
777 {% <

```

\@currpkg@reqd doesn't take a path because it is used later to assign \opt@... and \ver@....

```

778 \edef\@currpkg@reqd{\@currname.\@currentx}%
779 \ifx\CurrentFile\CurrentFileUsed
780 \else
781 \filename@parse\@curr@file
782 \edef\@currpath{\string@makeletter\filename@area}%
783 \edef\@currname{\string@makeletter\filename@base}%
784 \edef\@currentx{\string@makeletter\filename@ext}%
785 \fi
786 \load@onefile@withoptions{#2}%
787 \def\@currpkg@reqd%\@currpkg@reqd{
788 }% >

```

Now just clean up and exit.

```

789 \@expl@@@filehook@file@pop@@}%
790 \expandafter\@firstofone
791 \fi}%

```

Except in the case where \@currname is empty, the date is checked against the date marked in the package file:

```

792 {\@ifl@ter\@currentx{\@currname}{#3}}}%
793 {\@latex@warning@no@line
794 {You have requested,\on@line,
795 version\MessageBreak
796 '#3' of \@cls@pkg\space \@currname,\MessageBreak
797 but only version\MessageBreak
798 '\csname ver@\@currname.\@currentx\endcsname'\MessageBreak
799 is available}}}%

800 \ifx\@currentx\@clsextension\let\LoadClass\@twoloadclasserror\fi}%
801 \@popfilename
802 \@reset@options}

803 \let\@currpkg@reqd\@empty
804 \@onlypreamble\@onefilewithoptions

The kernel no longer uses \@unprocessedoptions
805 \let\@unprocessedoptions\@undefined

```

Now the action taken when a file is not found. Path must be included here as it eventually leads to a file lookup.

\@missing@onefilewithoptions

```

806 \def\@missing@onefilewithoptions#1{%
807 \@missingfileerror{\@currpath\@currname}\@currentx
808 \global\let\@currpath\@missingfile@area
809 \global\let\@currname\@missingfile@base
810 \global\let\@currentx\@missingfile@ext}

```

Now the code that actually does the file loading:

\load@onefile@withoptions

```

811 \def\load@onefile@withoptions#1{%
812 \let\CurrentOption\@empty
813 \@reset@options

```

Grab everything in a macro, so the parameter stack is popped before any processing begins.

```

814 \def\reserved@a{%
815   \@pass@options\@currentx{#1}\@currname}%

816 \expandafter\let
817   \csname opt@\@currpkg@reqd\expandafter\endcsname
818   \csname opt@\@currname.\@currentx\endcsname
819 \global\expandafter
820 \let\csname ver@\@currname.\@currentx\endcsname\@empty

```

We initialize `\dots-h@@k` here and only if we load the file so that it remains undefined otherwise.

```

821 \expandafter\let\csname\@currname.\@currentx-h@@k\endcsname\@empty

```

When the current extension is `\@pkgextension` we are loading a package otherwise, if it is `\@clsextension`, a class, so depending on that we execute different hooks. If the extension is neither, then it is another type of file without special hooks.

```

822 %-----
823 \ifx\@currentx\@pkgextension
824   \UseHook{package/before}%
825   \UseHook{package/before/\@currname}%
826 \else
827   \ifx\@currentx\@clsextension
828     \UseHook{class/before}%
829     \UseHook{class/before/\@currname}%
830   \fi
831 \fi

```

Now actually load the file (at this point we are certain it exists, but use `\InputIfFileExists` so that file hooks are executed). `\@currpath` is needed here too.

```

832 \InputIfFileExists{\@currpath\@currpkg@reqd}{}%
833   {\@latex@error
834     {The \@cls@pkg\space\@currpkg@reqd\space failed to load}\@ehd}%
835 %-----

```

In older versions of the code `\@unprocessedoptions` would generate an error for each specified option in a package unless a `\ProcessOptions` has appeared in the package file.

This has changed in 2020. We now use a separate macro per package to avoid interference in case of nested packages. The whole code for handling this issue (GitHub 22) was provided by Hironobu Yamashita, thanks for that.

```

836 \expandafter\let\csname unprocessedoptions-\@currname.\@currentx\endcsname
837   \@unprocessedoptions
838 \csname\@currname.\@currentx-h@@k\endcsname
839 \expandafter\let\csname\@currname.\@currentx-h@@k\endcsname
840   \@undefined

```

Catch the case where the packages has handled the options and redefined `\@unprocessedoptions` to `\relax` (old interface). In that case no error should be produced.

```

841 \ifx\@unprocessedoptions\relax
842   \let\@unprocessedoptions\undefined

```

Otherwise run the per package set of unused options.

```

843 \else
844 \csname unprocessedoptions-\@currname.\@current\endcsname
845 \fi

```

In either case we drop the macro afterwards as it is no longer needed.

```

846 \expandafter\let
847 \csname unprocessedoptions-\@currname.\@current\endcsname
848 \undefined

```

And same procedure, James, when we are finished loading, except that the hook order is now reversed.

```

849 %-----
850 \ifx\@current\@pkgextension
851 \UseHook{package/after/\@currname}%
852 \UseHook{package/after}%
853 \else
854 \ifx\@current\@clsextension
855 \UseHook{class/after/\@currname}%
856 \UseHook{class/after}%
857 \fi
858 \fi}%
859 %-----
860 \@ifl@aded\@current\@currname{}\reserved@a{}

861 </2ekernel | latexrelease>

5 Package/class rollback mechanism

```
1380 </2ekernel>
1381 <*2ekernel | latexreleasefirst>
```

`\pkgcls@debug` For testing we have a few extra lines of code that by default do nothing but one can set `\pkgcls@debug` to `\typeout` to get extra info. Sometime in the future this will be dropped.

```
1382 <*tracerollback>
1383 %\let\pkgcls@debug\typeout
1384 \let\pkgcls@debug\@gobble
1385 </tracerollback>
```

(End definition for \pkgcls@debug.)

`\requestedLaTeXdate` The macro (!) `\requestedLaTeXdate` holds the globally requested rollback date (via `latexrelease`) or zero if no such request was made.

```
1386 \def\requestedLaTeXdate{0}
```

(End definition for \requestedLaTeXdate.)

`\pkgcls@targetdate` If a rollback for a package or class is requested then `\pkgcls@targetdate` holds the requested date as a number YYYYMMDD (if there was one, otherwise the value of `\requestedLaTeXdate`) and `\pkgcls@targetlabel` will be empty. If there was a request for a named version then `\pkgcls@targetlabel` holds the version name and `\pkgcls@targetdate` is set to 1.

`\pkgcls@targetdate=0` is used to indicate that there was no rollback request. While loading an old release `\pkgcls@targetdate` is also reset to zero so that `\DeclareRelease` declarations are bypassed.

In contrast `\pkgcls@innerdate` will always hold the requested date (in a macro not a counter) if there was one, otherwise, e.g., if there was no request or a request to a version name it will contain T_EX largest legal number. While loading a file this can be used to provide conditionals that select code based on the request.

```
1387 \ifx\pkgcls@targetdate\@undefined
1388   \newcount\pkgcls@targetdate
1389   \fi
1390 \let\pkgcls@targetlabel\@empty
1391 \def\pkgcls@innerdate{\maxdimen}
```

(End definition for \pkgcls@targetdate, \pkgcls@targetlabel, and \pkgcls@innerdate.)

`\pkgcls@candidate` When looping through the `\DeclareRelease` declarations we record if the release is the best candidate we have seen so far. This is recorded in `\pkgcls@candidate` and we update it whenever we see a better one.

In `\pkgcls@releasedate` we keep track of the release date of that candidate.

```
1392 \let\pkgcls@candidate\@empty
1393 \let\pkgcls@releasedate\@empty
```

(End definition for \pkgcls@candidate and \pkgcls@releasedate.)

`\load@onefilewithoptions` the best place to add the rollback code is at the point where `\@onefilewithoptions` is called to load a single class or package.

To make things easy we save the old definition as `\load@onefilewithoptions` and then provide a new interface.

Important: as this code is also unconditionally placed into `latexrelease` we can only do this name change once otherwise both macros will contain the same code.

```
1394 \ifx\load@onefilewithoptions\@undefined
1395 \let\load@onefilewithoptions\@onefilewithoptions
1396 \def\@onefilewithoptions#1[#2][#3]#4{%
```

First a bit of tracing normally disabled.

```
1397 (*tracerollback)
1398 \pkgcls@debug{--- File loaded request (\noexpand\usepackage or ...)}%
1399 \pkgcls@debug{\@spaces 1: #1}%
1400 \pkgcls@debug{\@spaces 2: #2}%
1401 \pkgcls@debug{\@spaces 3: #3}%
1402 \pkgcls@debug{\@spaces 4: #4}%
1403 \tracerollback)
```

Two of the arguments are needed later on in error/warning messages so we save them.

```
1404 \def\pkgcls@name{#1}%           % for info message
1405 \def\pkgcls@arg {#3}%          % for info message
```

then we parse the final optional argument to determine if there is a specific rollback request for the current file. This will set `\pkgcls@targetdate`, `\pkgcls@targetlabel` and `\pkgcls@mindate`.

```
1406 \pkgcls@parse@date@arg{#3}%
```

When determining the correct release to load we keep track of candidates in `\pkgcls@candidate` and initially we don't have any:

```
1407 \let\pkgcls@candidate\@empty
```

If we had a rollback request then `#3` may contain data but not necessarily a “minimal date” so instead of passing it on we pass on the content of `\pkgcls@mindate`. We need to pass the value not the command, otherwise nested packages may pick up the wrong information.

```
1408 \begingroup
1409 \edef\reserved@a{%
1410 \endgroup
1411 \unexpanded{\load@onefilewithoptions#1[#2]}%
1412 [\pkgcls@mindate]%
1413 \unexpanded{#4}}%
1414 \reserved@a
1415 }
1416 \fi
```

(End definition for `\load@onefilewithoptions` and `\@onefilewithoptions`.)

`\pkgcls@parse@date@arg` The `\pkgcls@parse@date@arg` command parses the second optional argument of `\usepackage`, `\RequirePackage` or `\documentclass` for a rollback request setting the values of `\pkgcls@targetdate` and `\pkgcls@targetlabel`.

This optional argument has a dual purpose: If it just contains a date string then this means that the package should have at least that date (to ensure that a certain feature

is actually available, or a certain bug has been fixed). When the package gets loaded the information in `\Provides...` will then be checked against this request.

But if it starts with an equal sign followed by a date string or followed by a version name then this means that we should roll back to the state of the package at that date or to the version with the requested name.

If there was no optional argument or the optional argument does not start with “=” then the `\pkgcls@targetdate` is set to the date of the overall rollback request (via `latexrelease`) or if that was not given it is set to 0. In either case `\pkgcls@targetlabel` will be made empty.

If the argument doesn’t start with “=” then it is supposed to be a “minimal date” and we therefore save the value in `\pkgcls@mindate`, otherwise this macro is made empty.

So in summary we have:

Input	<code>\pkgcls@targetdate</code>	<code>\pkgcls@targetlabel</code>	<code>\pkgcls@mindate</code>
<code><empty></code>	<code><global-rollbackdate-as-number></code>	<code><empty></code>	<code><empty></code>
<code><date></code>	<code><global-rollbackdate-as-number></code>	<code><empty></code>	<code><date></code>
<code>=<date></code>	<code><date-as-number></code>	<code><empty></code>	<code><empty></code>
<code>=<version></code>	1	<code><version></code>	<code><empty></code>
<code><other></code>	<code><global-rollbackdate-as-number></code>	<code><empty></code>	<code><other></code>

where `<global-rollbackdate-as-number>` is a date request given via `latexrelease` or if there wasn’t one 0.

```
1417 \def\pkgcls@parse@date@arg #1{%
```

If the argument is empty we use the rollback date from `latexrelease` which has the value of zero if there was no rollback request. The label and the minimal date is made empty in that case.

```
1418 \ifx\@nil#1\@nil
1419 \pkgcls@targetdate\requestedLaTeXdate\relax
1420 \let\pkgcls@targetlabel\@empty
1421 \let\pkgcls@mindate\@empty
```

Otherwise we parse the argument further, checking for a = as the first character. We append a = at the end so that there is at least one such character in the argument.

```
1422 \else
1423 \pkgcls@parse@date@arg@#1=\@nil\relax
1424 \fi
1425 }
```

The actual parsing work then happens in `\pkgcls@parse@date@arg@`:

```
1426 \def\pkgcls@parse@date@arg@#1=#2\@nil{%
```

We set `\pkgcls@targetdate` depending on the parsing result; the code is expandable so we can do the parsing as part of the assignment.

```
1427 \pkgcls@targetdate
```

If a = was in first position then #1 will be empty. In that case #2 will be the original argument with a = appended.

This can be parsed with `\@parse@version`, the trailing character is simply ignored. This macro returns the parsed date as a number (or zero if it wasn’t a date) and accepts both YYYY/MM/DD and YYYY-MM-DD formats.

```
1428 \ifx\@nil#1\@nil
1429 \@parse@version0#2//00\@nil\relax
```

Whatever is returned is thus assigned to `\pkgcls@targetdate` and therefore we can now test its value. If the value is zero we assume that the remaining argument string represents a version and change `\pkgcls@targetdate` and set `\pkgcls@targetlabel` to the version name (after stripping off the trailing =).

```

1430     \ifnum \pkgcls@targetdate=\z@
1431         \pkgcls@targetdate\@ne
1432         \def\pkgcls@innerdate{\maxdimen}%
1433         \pkgcls@parse@date@arg@version#2%
1434     \else
1435         \edef\pkgcls@innerdate{\the\pkgcls@targetdate}%
1436     \fi
1437     \let\pkgcls@mindate\@empty
1438 \else

```

If #1 was not empty then there wasn't a = character in first position so we are dealing either with a “minimum date” or with some incorrect data. We assume the former and make the following assignments (the first one finishing the assignment of `\pkgcls@targetdate`):

```

1439     \requestedLaTeXdate\relax
1440     \let\pkgcls@targetlabel\@empty
1441     \def\pkgcls@innerdate{\maxdimen}%
1442     \def\pkgcls@mindate{#1}%

```

If the min-date is after the requested rollback date (if there is any, i.e., if it is not zero) then we have a conflict and therefore issue a warning.

```

1443     \ifnum \pkgcls@targetdate > \z@
1444     \ifnum \@parse@version0#1//00\@nil > \pkgcls@targetdate
1445         \@latex@warning@no@line{Suspicious rollback/min-date date given\MessageBreak
1446             A minimal date of #1 has been specified for
1447             \@cls@pkg\MessageBreak '\pkgcls@name'.\MessageBreak
1448             But this is in conflict
1449             with a rollback request to \requestedpatchdate}
1450     \fi
1451 \fi
1452 \fi
1453 }

```

Strip off the trailing = and assign the version name to `\pkgcls@targetlabel`.

```

1454 \def\pkgcls@parse@date@arg@version#1={%
1455     \def\pkgcls@targetlabel{#1}}

```

(End definition for `\pkgcls@parse@date@arg`.)

\DeclareRelease First argument is the “name” of the release and it can be left empty if one doesn't like to give a name to the release. The second argument is that from which on this release was available (or should be used in case of minor updates). The final argument is the external file name of this release, by convention this should be `<pkg/cls-name>-<date>.<extension>` but this is not enforced and through this argument one can overwrite it.

```

1456 \def\DeclareRelease#1#2#3{%
1457     \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1458     \*traceroollback}
1459     \pkgcls@debug{---\string\DeclareRelease:}%
1460     \pkgcls@debug{\@spaces 1: #1}%
1461     \pkgcls@debug{\@spaces 2: #2}%

```

```

1462     \pkgcls@debug{\@spaces 3: #3}%
1463 </tracerollback>

```

If the date argument #2 is empty we are dealing with a special release that should be only accessible via its name; a typical use case would be a “beta” release. So if we are currently processing a date request we ignore it and otherwise we check if we can match the name and if so load the corresponding release file.

```

1464     \ifx\@nil#2\@nil
1465         \ifnum\pkgcls@targetdate=\@ne % named request
1466             \def\reserved@a{#1}%
1467             \ifx\pkgcls@targetlabel\reserved@a
1468                 \pkgcls@use@this@release{#3}{}%
1469 <*tracerollback>
1470             \else
1471                 \pkgcls@debug{Label doesn't match}%
1472 </tracerollback>
1473         \fi
1474 <*tracerollback>
1475     \else
1476         \pkgcls@debug{Date request: ignored}%
1477 </tracerollback>
1478     \fi
1479 \else

```

If the value of \pkgcls@targetdate is greater than 1 (or in reality greater than something like 19930101) we are dealing with a rollback request to a specific date.

```

1480     \ifnum\pkgcls@targetdate>\@ne % a real request

```

So we parse the date of this release to check if it is before or after the request date.

```

1481         \ifnum\@parse@version#2//00\@nil
1482             >\pkgcls@targetdate

```

If it is after we have to distinguish between two cases: If there was an earlier candidate we use that one because the other is too late, but if there wasn't one (i.e., if current release is the oldest that exists) we use it as the best choice. However in that case something is wrong (as there shouldn't be a rollback to a date where a package used doesn't yet exists. So we make a complained to the user.

```

1483         \ifx\pkgcls@candidate\@empty
1484             \pkgcls@rollbackdate@error{#2}%
1485             \pkgcls@use@this@release{#3}{#2}%
1486         \else
1487             \pkgcls@use@this@release\pkgcls@candidate
1488                                     \pkgcls@releasedate
1489         \fi
1490     \else

```

Otherwise, if the release date of this version is before the target rollback and we record it as a candidate. But we don't use it yet as there may be another release which is still before the target rollback.

```

1491         \def\pkgcls@candidate{#3}%
1492         \def\pkgcls@releasedate{#2}%
1493 <*tracerollback>
1494         \pkgcls@debug{New candidate: #3}%
1495 </tracerollback>
1496     \fi
1497 \else

```

If we end up in this branch we have a named version request. So we check if `\pkgcls@targetlabel` matches the current name and if yes we use this release immediately, otherwise we do nothing as a later declaration may match it.

```

1498     \def\reserved@a{#1}%
1499     \ifx\pkgcls@targetlabel\reserved@a
1500       \pkgcls@use@this@release{#3}{#2}%
1501   \tracerollback
1502   \else
1503     \pkgcls@debug{Label doesn't match}%
1504 \tracerollback
1505   \fi
1506 \fi
1507 \fi
1508 \fi
1509 }

```

(End definition for `\DeclareRelease`.)

`\pkgcls@use@this@release` If a certain release has been selected (stored in the external file given in #1) we need to input it and afterwards stop reading the current file.

```

1510 \def\pkgcls@use@this@release#1#2{%

```

Before that we record the selection made inside the transcript.

```

1511   \pkgcls@show@selection{#1}{#2}%

```

We then set the `\pkgcls@targetdate` to zero so that any `\DeclareRelease` or `\DeclareCurrentRelease` in the file we now load are bypassed¹⁹ and then we finally load the correct release.

After loading that file we need to stop reading the current file so we issue `\endinput`. Note that the `\relax` before that is essential to ensure that the `\endinput` is only happening after the file has been fully processed, otherwise it would act after the first line of the `@@input`!

```

1512   \pkgcls@targetdate\z@
1513   @@input #1\relax
1514   \endinput
1515 }

```

(End definition for `\pkgcls@use@this@release`.)

`\pkgcls@show@selection` This command records what selection was made. As that is needed in two places (and it is rather lengthy) it was placed in a separate command. The first argument is the name of the external file that is being loaded and is only needed for debugging. The second argument is the date that corresponds to this file and it is used as part of the message.

```

1516 \def\pkgcls@show@selection#1#2{%
1517 \tracerollback
1518   \pkgcls@debug{Result: use #1}%
1519 \tracerollback
1520   \GenericInfo
1521     {\@spaces\@spaces\space}{Rollback for
1522       \cls@pkg\space'\@currname' requested ->
1523       \ifnum\pkgcls@targetdate>\@ne

```

¹⁹The older release may also have such declarations inside if it was a simply copy of the `.sty` or `.cls` file current at that date. Removing these declarations would make the file load a tiny bit faster, but this way it works in any case.

```

1524     date
1525     \ifnum\requestedLaTeXdate=\pkgcls@targetdate
1526       \requestedpatchdate
1527     \else
1528       \expandafter\@gobble\pkgcls@arg
1529     \fi.\MessageBreak

```

Instead of “best approximation” we could say that we have been able to exactly match the date (if it is exact), but that would mean extra tests without much gain, so not done.

```

1530     Best approximation is
1531   \else
1532     version '\pkgcls@targetlabel'.\MessageBreak
1533     This corresponds to
1534   \fi
1535   \ifx\@nil#2\@nil
1536     a special release%
1537   \else
1538     the release introduced on #2%
1539   \fi
1540   \@gobble}%
1541 }

```

(End definition for \pkgcls@show@selection.)

\pkgcls@rollbackdate@error This is called if the requested rollback date is earlier than the earliest known release of a package or class.

A similar error is given if global rollback date and min-date on a specific package conflict with each other, but that case is happens only once so it is inlined.

```

1542 \def\pkgcls@rollbackdate@error#1{%
1543   \@latex@error{Suspicious rollback date given}%
1544   {The \@cls@pkg\space'\@currname' has no rollback data
1545     before #1 which\MessageBreak
1546     is after your requested rollback date --- so
1547     something may be wrong here.\MessageBreak
1548     Continue and we use the earliest known release.}}

```

(End definition for \pkgcls@rollbackdate@error.)

\DeclareCurrentRelease This declares the date (and possible name) of the current version of a package or class.

```

1549 \def\DeclareCurrentRelease#1#2{%
1550   \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1551   \traceroollback
1552     \pkgcls@debug{---DeclareCurrentRelease}%
1553     \pkgcls@debug{ 1: #1}%
1554     \pkgcls@debug{ 2: #2}%
1555   \traceroollback

```

If the value is greater than 1 we have to deal with a date request, so we parse #2 as a date and compare it with \pkgcls@targetdate.

```

1556     \ifnum\pkgcls@targetdate>\@one % a date request
1557     \ifnum\@parse@version#2//00\@nil
1558       >\pkgcls@targetdate

```

If it is greater that means the release date if this file is later than the requested rollback date. Again we have two cases: If there was a previous candidate release we use that one as the current release is too young, but if there wasn't we have to use this release nevertheless as there isn't any alternative.

However this case can only happen if there is a `\DeclareCurrentRelease` but no declared older releases (so basically the use of the declaration is a bit dubious).

```

1559     \ifx\pkgcls@candidate\empty
1560     \pkgcls@rollbackdate@error{#2}%
1561     \else
1562     \pkgcls@use@this@release\pkgcls@candidate
1563     \pkgcls@releasedate
1564     \fi

```

Otherwise the current file is the right release, so we record that in the transcript and then carry on.

```

1565     \else
1566     \pkgcls@show@selection{current version}{#2}%
1567     \fi
1568     \else % a label request

```

Otherwise we have a rollback request to a named version so we check if that fits the current name and if not give an error as this was the last possible opportunity.

```

1569     \def\reserved@a{#1}%
1570     \ifx\pkgcls@targetlabel\reserved@a
1571     \pkgcls@show@selection{current version}{#2}%
1572     \else
1573     \@latex@error{Requested version '\pkgcls@targetlabel' for
1574     \cls@pkg\space'\@currname' is unknown}\@ehc
1575     \fi
1576     \fi
1577 \fi
1578 }

```

(End definition for `\DeclareCurrentRelease`.)

\IfTargetDateBefore This enables a simple form of conditional code inside a class or package file. If there is a date request and the request date is earlier than the first argument the code in the second argument is processed otherwise the code in the third argument is processed. If there was no date request then we also execute the third argument, i.e., we will get the “latest” version of the file.

Most often the second argument (before-date-code) will be empty.

```

1579 \DeclareRobustCommand\IfTargetDateBefore[1]{%
1580   \ifnum\pkgcls@innerdate <%
1581   \expandafter\@parse@version\expandafter0#1//00\@nil
1582   \typeout{Exclude code introduced on #1}%
1583   \expandafter\@firstoftwo
1584   \else
1585   \typeout{Include code introduced on #1}%
1586   \expandafter\@secondoftwo
1587   \fi
1588 }

```

(End definition for `\IfTargetDateBefore`.)

```

1589 </2ekernel | latexreleasefirst>

```

6 After Preamble

Finally we declare a package that allows all the commands declared above to be `\@onlypreamble` to be used after `\begin{document}`.

```
1590 <*afterpreamble>
1591 \NeedsTeXFormat{LaTeX2e}
1592 \ProvidesPackage{pkgindoc}
1593         [2020-08-08 v1.3m Package Interface in Document (DPC)]
1594 \def\reserved@a#1\do\@classoptionslist#2\do\filecontents#3\relax{%
1595     \gdef\@preamblecmds{#1#3}}
1596 \expandafter\reserved@a\@preamblecmds\relax
1597 </afterpreamble>
```

ltfilehook.dtx

Contents

1 Introduction

1.1 Provided hooks

The code offers a number of hooks into which packages (or the user) can add code to support different use cases. Many hooks are offered as pairs (i.e., the second hook is reversed). Also important to know is that these pairs are properly nested with respect to other pairs of hooks.

There are hooks that are executed for all files of a certain type (if they contain code), e.g., for all “include files” or all “packages”, and there are also hooks that are specific to a single file, e.g., do something after the package `foo.sty` has been loaded.

1.2 General hooks for file reading

There are four hooks that are called for each file that is read using document-level commands such as `\input`, `\include`, `\usepackage`, etc. They are not called for files read using internal low-level methods, such as `\@input` or `\openin`.

<code>file/before</code>
<code>file/before/...</code>
<code>file/after/...</code>
<code>file/after</code>

These are:

file/before, **file/before/⟨file-name⟩** These hooks are executed in that order just before the file is loaded for reading. The code of the first hook is used with every file, while the second is executed only for the file with matching *⟨file-name⟩* allowing you to specify code that only applies to one file.

file/after/⟨file-name⟩, **file/after** These hooks are after the file with name *⟨file-name⟩* has been fully consumed. The order is swapped (the specific one comes first) so that the **before** and **after** hooks nest properly, which is important if any of them involve grouping (e.g., contain environments, for example). Furthermore both hooks are reversed hooks to support correct nesting of different packages adding code to both */before* and */after* hooks.

So the overall sequence of hook processing for any file read through the user interface commands of L^AT_EX is:

```
\UseHook{⟨file/before⟩}
\UseHook{⟨file/before/⟨file name⟩⟩}
  ⟨file contents⟩
\UseHook{⟨file/after/⟨file name⟩⟩}
\UseHook{⟨file/after⟩}
```

The file hooks only refer to the file by its name and extension, so the $\langle file\ name \rangle$ should be the file name as it is on the filesystem with extension (if any) and without paths. Different from `\input` and similar commands, the `.tex` extension is not assumed in hook $\langle file\ name \rangle$, so `.tex` files must be specified with their extension to be recognized. Files within subfolders should also be addressed by their name and extension only.

Extensionless files also work, and should then be given without extension. Note however that \TeX prioritizes `.tex` files, so if two files `foo` and `foo.tex` exist in the search path, only the latter will be seen.

When a file is input, the $\langle file\ name \rangle$ is available in `\CurrentFile`, which is then used when accessing the `file/before/` $\langle file\ name \rangle$ and `file/after/` $\langle file\ name \rangle$.

`\CurrentFile`

The name of the file about to be read (or just finished) is available to the hooks through `\CurrentFile` (there is no `expl3` name for it for now). The file is always provided with its extension, i.e., how it appears on your hard drive, but without any specified path to it. For example, `\input{sample}` and `\input{app/sample.tex}` would both have `\CurrentFile` being `sample.tex`.

`\CurrentFilePath`

The path to the current file (complement to `\CurrentFile`) is available in `\CurrentFilePath` if needed. The paths returned in `\CurrentFilePath` are only user paths, given through `\input@path` (or `expl3`'s equivalent `\l_file_search_path_seq`) or by directly typing in the path in the `\input` command or equivalent. Files located by `kpsewhich` get the path added internally by the \TeX implementation, so at the macro level it looks as if the file were in the current folder, so the path in `\CurrentFilePath` is empty in these cases (package and class files, mostly).

`\CurrentFileUsed`
`\CurrentFilePathUsed`

In normal circumstances these are identical to `\CurrentFile` and `\CurrentFilePath`. They will differ when a file substitution has occurred for `\CurrentFile`. In that case, `\CurrentFileUsed` and `\CurrentFilePathUsed` will hold the actual file name and path loaded by \LaTeX , while `\CurrentFile` and `\CurrentFilePath` will hold the names that were *asked for*. Unless doing very specific work on the file being read, `\CurrentFile` and `\CurrentFilePath` should be enough.

1.3 Hooks for package and class files

Commands to load package and class files (e.g., `\usepackage`, `\RequirePackage`, `\LoadPackageWithOptions`, etc.) offer the hooks from section 1.2 when they are used to load a package or class file, e.g., `file/after/array.sty` would be called after the `array` package got loaded. But as packages and classes form as special group of files, there are some additional hooks available that only apply when a package or class is loaded.

<hr/> package/before	These are:
package/after	
package/before/...	package/before, package/after These hooks are called for each package being loaded.
package/after/...	
class/before	package/before/⟨name⟩, package/after/⟨name⟩ These hooks are additionally called if
class/after	the package name is ⟨name⟩ (without extension).
class/before/...	
class/after/...	class/before, class/after These hooks are called for each class being loaded.
<hr/>	
	class/before/⟨name⟩, class/after/⟨name⟩ These hooks are additionally called if the
	class name is ⟨name⟩ (without extension).

All `/after` hooks are implemented as reversed hooks.

The overall sequence of execution for `\usepackage` and friends is therefore:

```

\UseHook{⟨package/before⟩}
\UseHook{⟨package/before/⟨package name⟩⟩}

  \UseHook{⟨file/before⟩}
  \UseHook{⟨file/before/⟨package name⟩.sty⟩}
    ⟨package contents⟩
  \UseHook{⟨file/after/⟨package name⟩.sty⟩}
  \UseHook{⟨file/after⟩}

  code from \AtEndOfPackage if used inside the package

\UseHook{⟨package/after/⟨package name⟩⟩}
\UseHook{⟨package/after⟩}

```

and similar for class file loading, except that `package/` is replaced by `class/` and `\AtEndOfPackage` by `\AtEndOfClass`.

If a package or class is not loaded (or it was loaded before the hooks were set) none of the hooks are executed!

1.4 Hooks for `\include` files

To manage `\include` files, L^AT_EX issues a `\clearpage` before and after loading such a file. Depending on the use case one may want to execute code before or after these `\clearpages` especially for the one that is issued at the end.

Executing code before the final `\clearpage`, means that the code is processed while the last page of the included material is still under construction. Executing code after it means that all floats from inside the include file are placed (which might have added further pages) and the final page has finished.

Because of these different scenarios we offer hooks in three places.²⁰ None of the hooks are executed when an `\include` file is bypassed because of an `\includeonly` declaration. They are, however, all executed if L^AT_EX makes an attempt to load the `\include` file (even if it doesn't exist and all that happens is “No file `⟨filename⟩.tex`”).

²⁰If you want to execute code before the first `\clearpage` there is no need to use a hook—you can write it directly in front of the `\include`.

```

include/before
include/before/...
include/end
include/end/...
include/after
include/after/...

```

These are:

include/before, include/before/⟨name⟩ These hooks are executed (in that order) after the initial `\clearpage` and after `.aux` file is changed to use `⟨name⟩.aux`, but before the `⟨name⟩.tex` file is loaded. In other words they are executed at the very beginning of the first page of the `\include` file.

include/end/⟨name⟩, include/end These hooks are executed (in that order) after `ℒTEX` has stopped reading from the `\include` file, but before it has issued a `\clearpage` to output any deferred floats.

include/after/⟨name⟩, include/after These hooks are executed (in that order) after `ℒTEX` has issued the `\clearpage` but before it has switched back writing to the main `.aux` file. Thus technically we are still inside the `\include` and if the hooks generate any further typeset material including anything that writes to the `.aux` file, then it would be considered part of the included material and bypassed if it is not loaded because of some `\includeonly` statement.²¹

1.5 High-level interfaces for `ℒTEX`

We do not provide any additional wrappers around the hooks (like `filehook` or `scrfile` do) because we believe that for package writers the high-level commands from the hook management, e.g., `\AddToHook`, etc. are sufficient and in fact easier to work with, given that the hooks have consistent naming conventions.

1.6 Internal interfaces for `ℒTEX`

```

\declare@file@substitution    \declare@file@substitution    {\file}\{replacement-file\}
\undecclare@file@substitution \undecclare@file@substitution {\file}

```

If `⟨file⟩` is requested for loading replace it with `⟨replacement-file⟩`. `\CurrentFile` remains pointing to `⟨file⟩` but `\CurrentFileUsed` will show the file actually loaded.

The main use case for this declaration is to provide a corrected version of a package that can't be changed (due to its license) but no longer functions because of `ℒTEX` kernel changes, for example, or to provide a version that makes use of new kernel functionality while the original package remains available for use with older releases.

The `\undecclare@file@substitution` declaration undoes a substitution made earlier.

Please do not misuse this functionality and replace a file with another unless if really needed and only if the new version is implementing the same functionality as the original one!

²¹For that reason another `\clearpage` is executed after these hooks which normally does nothing, but starts a new page if further material got added this way.

```
\disable@package@load  {\package}} {\alternate-code}}
\reenable@package@load {\package}}
```

If $\langle package \rangle$ is requested do not load it but instead run $\langle alternate-code \rangle$ which could issue a warning, error or any other code.

The main use case is for classes that want to restrict the set of supported packages or contain code that make the use of some packages impossible. So rather than waiting until the document breaks they can set up informative messages why certain packages are not available.

The function is only implemented for packages not for arbitrary files.

1.7 A sample package for structuring the log output

As an application we provide the package `structuredlog` that adds lines to the `.log` when a file is opened and closed for reading keeping track of nesting level as well. For example, for the current document it adds the lines

```
= (LEVEL 1 START) t1lmr.fd
= (LEVEL 1 STOP) t1lmr.fd
= (LEVEL 1 START) supp-pdf.mkii
= (LEVEL 1 STOP) supp-pdf.mkii
= (LEVEL 1 START) nameref.sty
== (LEVEL 2 START) refcount.sty
== (LEVEL 2 STOP) refcount.sty
== (LEVEL 2 START) gettitlestring.sty
== (LEVEL 2 STOP) gettitlestring.sty
= (LEVEL 1 STOP) nameref.sty
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.hd
= (LEVEL 1 STOP) ltfilehook-doc.hd
= (LEVEL 1 START) ltfilehook.dtx
== (LEVEL 2 START) ot1lmr.fd
== (LEVEL 2 STOP) ot1lmr.fd
== (LEVEL 2 START) omllmm.fd
== (LEVEL 2 STOP) omllmm.fd
== (LEVEL 2 START) omslmsy.fd
== (LEVEL 2 STOP) omslmsy.fd
== (LEVEL 2 START) omxlmex.fd
== (LEVEL 2 STOP) omxlmex.fd
== (LEVEL 2 START) umsa.fd
== (LEVEL 2 STOP) umsa.fd
== (LEVEL 2 START) umsb.fd
== (LEVEL 2 STOP) umsb.fd
== (LEVEL 2 START) ts1lmr.fd
== (LEVEL 2 STOP) ts1lmr.fd
== (LEVEL 2 START) t1lmss.fd
== (LEVEL 2 STOP) t1lmss.fd
= (LEVEL 1 STOP) ltfilehook.dtx
```

Thus if you inspect an issue in the .log it is easy to figure out in which file it occurred, simply by searching back for LEVEL and if it is a STOP then remove 1 from the level value and search further for LEVEL with that value which should then be the START level of the file you are in.

2 The Implementation

```
1 <*2ekernel>
2 <@@=filehook>
```

2.1 Document and package-level commands

\CurrentFile User-level macros that hold the current file name and file path. These are used internally as well because the code takes care to protect against a possible redefinition of these macros in the loaded file (it's necessary anyway to make hooks work with nested \input). The versions \...Used hold the *actual* file name and path that is loaded by L^AT_EX, whereas the other two hold the name as requested. They will differ in case there's a file substitution.

```
3 </2ekernel>
4 <*2ekernel | latexrelease>
5 <latexrelease>\IncludeInRelease{2020/10/01}%
6 <latexrelease>                {\CurrentFile}{Hook management file}%

21 <latexrelease>\let \CurrentFilePathUsed \@undefined
22 <latexrelease>
23 <latexrelease>\EndIncludeInRelease
24 <*2ekernel>
```

(End definition for \CurrentFile and others. These functions are documented on page 763.)

2.2 expl3 helpers

```
25 </2ekernel>
26 <*2ekernel | latexrelease>
27 <latexrelease>\IncludeInRelease{2020/10/01}%
28 <latexrelease>                {\_filehook_file_parse_full_name:nN}{File helpers}%
29 \ExplSyntaxOn
```

_filehook_file_parse_full_name:nN A utility macro to trigger expl3's file-parsing and lookup, and return a normalized representation of the file name. If the queried file doesn't exist, no normalization takes place.

_filehook_full_name:nn

The output of `__filehook_file_parse_full_name:nN` is passed on to the #2—a 3-argument macro that takes the *<path>*, *<base>*, and *<ext>* parts of the file name.

```

30 \cs_new:Npn \__filehook_file_parse_full_name:nN #1
31 {
32   \exp_args:Nf \file_parse_full_name_apply:nN
33   {
34     \exp_args:Nf \__filehook_full_name:nn
35     { \file_full_name:n {#1} } {#1}
36   }
37 }
38 \cs_new:Npn \__filehook_full_name:nn #1 #2
39 {
40   \tl_if_empty:nTF {#1}
41   { \tl_trim_spaces:n {#2} }
42   { \tl_trim_spaces:n {#1} }
43 }

```

(End definition for `__filehook_file_parse_full_name:nN` and `__filehook_full_name:nn`.)

Some actions depend on whether the file extension was explicitly given, and sometimes the extension has to be removed. The macros below use `__filehook_file_parse_full_name:nN` to split up the file name and either check if *<ext>* (#3) is empty, or discard it.

```

44 \cs_new:Npn \__filehook_if_no_extension:nTF #1
45 {
46   \exp_args:Ne \tl_if_empty:nTF
47   { \file_parse_full_name_apply:nN {#1} \use_iii:nnn }
48 }
49 \cs_new_protected:Npn \__filehook_drop_extension:N #1
50 {
51   \tl_gset:Nx #1
52   {
53     \exp_args:NV \__filehook_file_parse_full_name:nN #1
54     \__filehook_drop_extension_aux:nnn
55   }
56 }
57 \cs_new:Npn \__filehook_drop_extension_aux:nnn #1 #2 #3
58 { \tl_if_empty:nF {#1} { #1 / } #2 }

```

(End definition for `__filehook_if_no_extension:nTF` and `__filehook_drop_extension:N`.)

Yet another stack, to keep track of `\CurrentFile` and `\CurrentFilePath` with nested `\inputs`. At the beginning of `\InputIfFileExists`, the current value of `\CurrentFilePath` and `\CurrentFile` is pushed to `\g__filehook_input_file_seq`, and at the end, it is popped and the value reassigned. Some other places don't use `\InputIfFileExists` directly (`\include`) or need `\CurrentFile` earlier (`\@onefilewithoptions`), so these are manually used elsewhere as well.

```

59 \tl_new:N \l__filehook_internal_tl
60 \seq_new:N \g__filehook_input_file_seq
61 \cs_new_protected:Npn \__filehook_file_push:

2.3 Declaring the file-related hooks

All hooks starting with `file/`, `include/`, `class/` or `package/` are generic and will be allocated if code is added to them. Thus there is no need to explicitly declare any hook in the code below.

Furthermore, those named `.../after` or `.../end` are automatically declared as reversed hooks if filled with code, so this is also automatically taken care of.

2.4 Patching L^AT_EX's `\InputIfFileExists` command

Most of what we have to do is adding `\UseHook` into several L^AT_EX 2_ε core commands, because of some circular dependencies in the kernel we do this only now and not in `ltfiles`.

```

\InputIfFileExists \InputIfFileExists loads any file if it is available so we have to add the hooks
\@input@file@exists@with@hooks file/before and file/after in the right places. If the file doesn't exist no hooks
\unqu@tefilef@und should be executed.
142 </2ekernel>
143 <latexrelease>\IncludeInRelease{2020/10/01}%

149   {%
150     \@expl@@@filehook@file@push@@
151     \@filehook@set@CurrentFile

```

We pre-expand `\@filef@und` so that in case another file is loaded in the true branch of `\InputIfFileExists`, these don't change their value meanwhile. This isn't a worry with `\CurrentFile...` because they are kept in a stack.

```

152   \expandafter\@swaptwoargs\expandafter
153   {\expandafter\@input@file@exists@with@hooks
154     \expandafter{\@filef@und}}%
155   {#2}%
156   \@expl@@@filehook@file@pop@@
157 }%
158 }
159 \def\@input@file@exists@with@hooks#1{%

```

If the file exists then `\CurrentFile` holds its name. But we can't rely on that still being true after the file has been processed. Thus for using the name in the file hooks we need to preserve the name and then restore it for the `file/after/...` hook.

The hook always refers to the file requested by the user. The hook is *always* loaded for `\CurrentFile` which usually is the same as `\CurrentFileUsed`. In the case of a file replacement, the `\CurrentFileUsed` holds the actual file loaded. In any case the file names are normalized so that the hooks work on the real file name, rather than what the user typed in.

`expl3's \file_full_name:n` normalizes the file name (to factor out differences in the `.tex` extension), and then does a file lookup to take into account a possible path from `\l_file_search_path_seq` and `\input@path`. However only the file name and extension are returned so that file hooks can refer to the file by their name only. The path to the file is returned in `\CurrentFilePath`.

```

160 \edef\reserved@a{%
161   \@expl@@@filehook@file@pop@assign@@nnnn

166 \expandafter\@swaptwoargs\expandafter{\reserved@a}%

```

Before adding to the file list we need to make all (letter) characters catcode 11, because several packages use constructions like

```

\filename@parse{<filename>}
\ifx\filename@ext\@clsextension
...
\fi

```

and that doesn't work if `\filename@ext` is `\detokenized`. Making `\@clsextension` a string doesn't help much because some packages define their own `\<prefix>@someextension` with normal catcodes. This is not entirely correct because packages loaded (somehow) with catcode 12 alphabetic tokens (say, as the result of a `\string` or `\detokenize` command, or from a T_EX string like `\jobname`) will have these character tokens incorrectly

turned into letter tokens. This however is rare, so we'll go for the all-letters approach (grepping the packages in T_EX Live didn't bring up any obvious candidate for breaking with this catcode change).

```

2.5 Declaring a file substitution

```

199 <@@=filehook>
200 </2ekernel>
201 <*2ekernel | latexrelease>
202 <latexrelease>\IncludeInRelease{2020/10/01}%
203 <latexrelease>          {\_filehook_subst_add:nn}{Declaring file substitution}%
204 \ExplSyntaxOn

\_filehook_subst_add:nn \_filehook_subst_add:nn declares a file substitution by doing a (global) definition
\_filehook_subst_remove:n of the form \def\@file-subst@<file>{\<replacement>}. The file names are properly
\_filehook_subst_file_normalize:Nn sanitised, and normalized with the same treatment done for the file hooks. That is, a
\_filehook_subst_empty_name_chk:NN file replacement is declared by using the file name (and extension, if any) only, and the
file path should not be given. If a file name is empty it is replaced by .tex (the empty
cname is used to check that).

205 \cs_new_protected:Npn \_filehook_subst_add:nn #1 #2

2.6 Selecting a file (\set@curr@file)

\set@curr@file Now we hook into \set@curr@file to resolve a possible file substitution, and add **\curr@file** \@expl@@@filehook@set@curr@file@@nNN at the end, after \curr@file is set.

\curr@file@reqd

A file name is built using \expandafter\string\csname<filename>\endcsname to avoid expanding utf8 active characters. The \csname expands the normalization machinery and the routine to resolve a file substitution, returning a control sequence with the same name as the file.

It happens that when <filename> is empty, the generated control sequence is \csname\endcsname, and doing \string on that results in the file `csname\endcsname.tex`. To guard against that we \ifx-compare the generated control sequence with the empty csname. To do so, \csname\endcsname has to be defined, otherwise it would be equal to \relax and we would have false positives. Here we define \csname\endcsname to expand to itself to avoid it matching the definition of some other control sequence.

```
264 </2ekernel>
```

```

265 <*2kernel | latexrelease>
266 <latexrelease>\IncludeInRelease{2021/05/01}%
267 <latexrelease>{\set@curr@file}{Setting current file name}%
268 \def\set@curr@file#1{%

271     \let\protect\string
272     \expandafter\def\csname\expandafter\endcsname
273       \expandafter{\csname\endcsname}%

```

Two file names are set here: `\@curr@file@reqd` which is the file requested by the user, and `\@curr@file` which should be the same, except when we have a file substitution, in which case it holds the actual loaded file. `\@curr@file` is resolved first, to check if a substitution happens. If it doesn't, `\@expl@@@filehook@if@file@replaced@@TF` short-cuts and just copies `\@curr@file`, otherwise the full normalization procedure is executed.

At this stage the file name is parsed and normalized, but if the input doesn't have an extension, the default `.tex` is *not* added to `\@curr@file` because for applications other than `\input` (graphics, for example) the default extension may not be `.tex`. First check if the input has an extension, then if the input had no extension, call `\@expl@@@filehook@drop@extension@@N`. In case of a file substitution, `\@curr@file` will have an extension.

```

```

flag__filehook_file_replaced
__filehook_if_file_replaced:TF
__filehook_clear_replacement_flag:

```

Since the file replacement is done expandably in a `\csname`, use a flag to remember if a substitution happened. We use this in `\set@curr@file` to short-circuit some of it in case no substitution happened (by far the most common case, so it's worth optimizing). The flag raised during the file substitution algorithm must be explicitly cleared after the `__filehook_if_file_replaced:TF` conditional is no longer needed, otherwise further uses of `__filehook_if_file_replaced:TF` will wrongly return true.

```

379 \flag_new:n { __filehook_file_replaced }
380 \cs_new:Npn __filehook_if_file_replaced:TF #1 #2
381   { \flag_if_raised:nTF { __filehook_file_replaced } {#1} {#2} }
382 \cs_new_protected:Npn __filehook_clear_replacement_flag:
383   { \flag_clear:n { __filehook_file_replaced } }

```

```

__filehook_file_subst_begin:nnn

```

First off, start by checking if the current file ($\langle name \rangle + \langle ext \rangle$) has a declared substitution. If not, then just put that as the name (including a possible $\langle path \rangle$ in this case): this is the default case with no substitutions, so it's the first to be checked. The auxiliary `__filehook_file_subst_tortoise_hare:nn` sees that there's no replacement for `#2#3` and does nothing else.

```

384 \cs_new:Npn __filehook_file_subst_begin:nnn #1 #2 #3
385   {
386     __filehook_file_subst_tortoise_hare:nn { #2#3 } { #2#3 }
387     { __filehook_file_name_compose:nnn {#1} {#2} {#3} }
388   }
389 \ExplSyntaxOff
390 </2ekernel|latexrelease>
391 <latexrelease>\EndIncludeInRelease
392 <*2ekernel>

```

2.7.1 The Tortoise and Hare algorithm

```

__filehook_file_subst_tortoise_hare:nn
__filehook_file_subst_loop:NN
__filehook_file_subst_loop:cc

```

If there is a substitution ($\langle true \rangle$ in the first `\cs_if_exist:cTF` below), then first check if there is no substitution down the line: this should be the second most common case, of one file replaced by another. In that case just leave the substitution there and the job is done. If any substitution happens, then the `\flag __filehook_file_replaced` is raised (conditionally, because checking if a flag is raised is much faster than raising it over and over again).

If, however there are more substitutions, then we need to check for a possible loop in the substitutions, which would otherwise put T_EX in an infinite loop if just an exhaustive expansion was used.

To detect a loop, the *Tortoise and Hare* algorithm is used. The name of the algorithm is an analogy to Aesop's fable, in which the Hare outruns a Tortoise. The two pointers here are the csnames which contains each file replacement, both of which start at the position zero, which is the file requested. In the inner part of the macro below, `__filehook_file_subst_loop:cc` is called with `\@file-subst@<file>` and `\@file-subst@\@file-subst@<file>`; that is, the substitution of $\langle file \rangle$ and the substitution of that substitution: the Tortoise walks one step while the Hare walks two.

Within `__filehook_file_subst_loop:NN` the two substitutions are compared, and if they lead to the same file it means that there is a loop in the substitutions. If there's no loop, `__filehook_file_subst_tortoise_hare:nn` is called again with the Tortoise at position 1 and the hare at 2. Again, the substitutions are checked ahead of the Hare pointer to check that it won't run too far; in case there is no loop in the declarations, eventually one of the `\cs_if_exist:cTF` below will go $\langle false \rangle$ and the algorithm will end;

otherwise it will run until the Hare reaches the same spot as the tortoise and a loop is detected.

```

393 </2kernel>
394 <*2kernel|latexrelease>
395 <latexrelease>\IncludeInRelease{2020/10/01}%
396 <latexrelease> {\__filehook_file_subst_tortoise_hare:nn}{Tortoise and Hare}%
397 \ExplSyntaxOn
398 \cs_new:Npn \__filehook_file_subst_tortoise_hare:nn #1 #2 #3
399 {
400   \cs_if_exist:cTF { @file-subst@ #2 }
401   {
402     \flag_if_raised:nF { __filehook_file_replaced }
403     { \flag_raise:n { __filehook_file_replaced } }
404     \cs_if_exist:cTF { @file-subst@ \use:c { @file-subst@ #2 } }
405     {
406       \__filehook_file_subst_loop:cc
407       { @file-subst@ #1 }
408       { @file-subst@ \use:c { @file-subst@ #2 } }
409     }
410     { \use:c { @file-subst@ #2 } }
411   }
412   { #3 }
413 }

```

This is just an auxiliary to check if a loop was found, and continue the algorithm otherwise. If a loop is found, the .tex file is used as fallback and __filehook_file_subst_cycle_error:cN is called to report the error.

```

414 \cs_new:Npn \__filehook_file_subst_loop:NN #1 #2
415 {
416   \token_if_eq_meaning:NNTF #1 #2
417   {
418     .tex
419     \__filehook_file_subst_cycle_error:cN { @file-subst@ #1 } #1
420   }
421   { \__filehook_file_subst_tortoise_hare:nn {#1} {#2} {#2} }
422 }
423 \cs_generate_variant:Nn \__filehook_file_subst_loop:NN { cc }

```

Showing this type of error expandably is tricky, as we have a very limited amount of characters to show and a potentially large list. As a work around, several errors are printed, each showing one step of the loop, until all the error messages combined show the loop.

```

424 \cs_new:Npn \__filehook_file_subst_cycle_error:NN #1 #2
425 {
426   \__kernel_msg_expandable_error:nnff { kernel } { file-cycle }
427   {#1} { \use:c { @file-subst@ #1 } }
428   \token_if_eq_meaning:NNTF #1 #2
429   { \__filehook_file_subst_cycle_error:cN { @file-subst@ #1 } #2 }
430 }
431 \cs_generate_variant:Nn \__filehook_file_subst_cycle_error:NN { c }

```

And the error message:

```

432 \__kernel_msg_new:nnn { kernel } { file-cycle }
433 { File~loop!~#1~replaced~by~#2... }

```

(End definition for `_filehook_resolve_file_subst:w` and others.)

512         \CurrentFileUsed
If there was a file replacement, show that as well:
513         \str_if_eq:nnF \CurrentFileUsed \CurrentFile
514         { ~ ( \CurrentFile \c_space_tl requested ) }
515         \iow_newline:
516     }
517     \str_if_eq:nnT {#1} {STOP} { \int_gdecr:N \g_filehook_nesting_level_int }
518 }

Now just hook the macro above in the generic file/before...
519 \AddToHook{file/before}{ \__filehook_log_file_record:n { START } }
...and file/after hooks. We don't want to install the file/after hook immediately,
because that would mean it is the first time executed when the package finishes. We
therefore put the declaration inside \AddToHookNext so that it gets only installed when
we have left this package.
520 \AddToHookNext{file/after}
521 { \AddToHook{file/after}{ \__filehook_log_file_record:n { STOP } } }

(End definition for \__filehook_log_file_record:n.)

522 <@@=
523 </structuredlog>

```

4 Package emulations

4.1 Package `atveryend` emulation

With the new hook management and the hooks in `\enddocument` all of `atveryend` is taken care of. We can make an emulation only here after the substitution functionality is available:

```
524 \*2kernel)
525 \declare@file@substitution{atveryend.sty}{atveryend-ltx.sty}
526 \*2kernel)
```

Here is the package file we point to:

```
527 \*atveryend-ltx)
528 \ProvidesPackage{atveryend-ltx}
529 [2020/08/19 v1.0a
530 Emulation of the original atvery package^^Jwith kernel methods]
```

Here are new definitions for its interfaces now pointing to the hooks in `\enddocument`

```
531 \newcommand\AfterLastShipout {\AddToHook{enddocument/afterlastpage}}
532 \newcommand\AtVeryEndDocument {\AddToHook{enddocument/afteraux}}
```

Next one is a bit of a fake, but the result should normally be as expected. If not, one needs to add a rule to sort the code chunks in `enddocument/info`.

```
533 \newcommand\AtEndAfterFileList{\AddToHook{enddocument/info}}
534 \newcommand\AtVeryVeryEnd {\AddToHook{enddocument/end}}
```

`\BeforeClearDocument` This one is the only one we don't implement or rather don't have a dedicated hook in the code.

```
535 \ExplSyntaxOn
536 \newcommand\BeforeClearDocument[1]
537 { \AtEndDocument{#1}
538   \atveryend@DEPRECATED{BeforeClearDocument \tl_to_str:n{#1}}
539 }
540 \cs_new:Npn\atveryend@DEPRECATED #1
541 {\iow_term:x{=====~DEPRECATED~USAGE~#1~=====}}
542 \ExplSyntaxOff
```

(End definition for \BeforeClearDocument.)

```
543 \*atveryend-ltx)
```

ltshipout.dtx

Contents

1 Introduction

The code provides an interface to the `\shipout` primitive of T_EX which is called when a finished pages is finally “shipped out” to the target output file, e.g., the `.dvi` or `.pdf` file. A good portion of the code is based on ideas by Heiko Oberdiek implemented in his packages `atbegshi` and `atenddvi` even though the interfaces are somewhat different.²²

1.1 Overloading the `\shipout` primitive

`\shipout`

With this implementation T_EX’s `shipout` primitive is no longer available for direct use. Instead `\shipout` is running some (complicated) code that picks up the box to be shipped out regardless of how that is done, i.e., as a constructed `\vbox` or `\hbox` or as a box register.

It then stores it in a named box register. This box can then be manipulated through a set of hooks after which it is shipped out for real.

Each `shipout` that actually happens (i.e., where the material is not discarded for one or the other reason) is recorded and the total number is available in a readonly variable and in a L^AT_EX counter.

`\RawShipout`

This command implements a simplified `shipout` that bypasses the foreground and background hooks, e.g., only `shipout/firstpage` and `shipout/lastpage` are executed and the total `shipout` counters are incremented.

The command doesn’t use `\ShipoutBox` but its own private box register so that it can be used inside of `shipout` hooks to do some additional `shipouts` while already in the output routine with the current page being stored in `\ShipoutBox`. It does have access to `\ShipoutBox` if it is used in `shipout/before` (or `shipout/after`) and can use its content.

It is safe to use it in `shipout/before` or `shipout/after` but not necessarily in the other `shipout/...` hooks as they are intended for special processing.

²²Heiko’s interfaces are emulated by the kernel code, if a document requests his packages, so older documents will continue to work.

`\ShipoutBox`
`\l_shipout_box`

This box register is called `\ShipoutBox` (alternatively available via the L3 name `\l_shipout_box`).

During the execution of `shipout/before` this box contains the accumulated material for the page, but not yet any material added by other shipout hooks. During execution of `shipout/after`, i.e., after the shipout has happened, the box also contains any background or foreground material.

Material from the hooks `shipout/firstpage` or `shipout/lastpage` is not included (but only used during the actual shipout) to facilitate reuse of the box data (e.g., `shipout/firstpage` material should never be added to a later page of the output).

`\l_shipout_box_ht_dim`
`\l_shipout_box_dp_dim`
`\l_shipout_box_wd_dim`
`\l_shipout_box_ht_plus_dp_dim`

The shipout box dimensions are available in the L3 registers `\l_shipout_box_ht_dim`, etc. (there are no $\text{\LaTeX} 2_{\epsilon}$ names).²³ These variables can be used inside the hook code for `shipout/before`, `shipout/foreground` and `shipout/background` if needed.

1.2 Provided hooks

`shipout/before`
`shipout/after`
`shipout/foreground`
`shipout/background`
`shipout/firstpage`
`shipout/lastpage`

The code for `\shipout` offers a number of hooks into which packages (or the user) can add code to support different use cases. These are:

shipout/before This hook is executed after the finished page has been stored in `\ShipoutBox` / `\l_shipout_box`. It can be used to alter that box content or to discard it completely (see `\DiscardShipoutBox` below).

You can use `\RawShipout` inside this hook for special use cases. It can make use of `\ShipoutBox` (which doesn't yet include the background and foreground material).

Note: It is not possible (or say advisable) to try and use this hook to typeset material with the intention to return it to main vertical list, it will go wrong and give unexpected results in many cases—for starters it will appear after the current page not before or it will vanish or the vertical spacing will be wrong!

shipout/background This hook adds a picture environment into the background of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of `1pt`. It should therefore only receive `\put` commands or other commands suitable in a `picture` environment and the vertical coordinate values would normally be negative.

Technically this is implemented by adding a zero-sized `\hbox` as the very first item into the `\ShipoutBox` containing that `picture` environment. Thus the rest of the box content will overprint what ever is typeset by that hook.

²³Might need changing, but HO's version as strings is not really helpful I think).

shipout/foreground This hook adds a picture environment into the foreground of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of 1pt.

Technically this is implemented by adding a zero-sized `\hbox` as the very last item into the `\ShipoutBox` and raising it up so that it still has its (0,0) point in the top-left corner. But being placed after the main box content it will be typeset later and thus overprints it (i.e., is in the foreground).

shipout/firstpage The material from this hook is executed only once at the very beginning of the first output page that is shipped out (i.e., not discarded at the last minute). It should only contain `\special` or similar commands needed to direct post processors handling the .dvi or .pdf output.²⁴

This hook is added to the very first page regardless of how it is shipped out (i.e., with `\shipout` or `\RawShipout`).

shipout/lastpage The corresponding hook to add `\specials` at the very end of the output file. It is only executed on the very last page of the output file — or rather on the page that L^AT_EX believes is the last one. Again it is executed regardless of the shipout method.

It may not be possible for L^AT_EX to correctly determine which page is the last one without several reruns. If this happens and the hook is non-empty then L^AT_EX will add an extra page to place the material and also request a rerun to get the correct placement sorted out.

shipout/after This hook is executed after a shipout has happened. If the shipout box is discarded this hook is not looked at.

You can use `\RawShipout` inside this hook for special use cases and the main `\ShipoutBox` is still available at this point (but in contrast to **shipout/before** it now includes the background and foreground material).

Note: Just like **shipout/before** this hook is not meant to be used for adding adding typeset material back to the main vertical list—it might vanish or the vertical spacing will be wrong!

As mentioned above the hook **shipout/before** is executed first and can manipulate the prepared shipout box stored in `\ShipoutBox` or set things up for use in `\write` during the actual shipout. It is even run if there was a `\DiscardShipoutBox` request in the document.

The other hooks (except **shipout/after**) are added inside hboxes to the box being shipped out in the following order:

<code>shipout/firstpage</code>	only on the first page
<code>shipout/background</code>	
<code><i><boxed content of \ShipoutBox></i></code>	
<code>shipout/foreground</code>	
<code>shipout/lastpage</code>	only on the last page

If any of the hooks has no code then that particular no box is added at that point.

Once the (page) box has been shipped out the **shipout/after** hook is called (while you are still inside the output routine). It is not called if the shipout box was discarded.

²⁴In L^AT_EX 2_ε that was already existing, but implemented using a box register with the name `\@begindivibox`.

In a document that doesn't produce pages, e.g., only makes `\typeouts`, none of the hooks are ever executed (as there is no `\shipout`) not even the `shipout/lastpage` hook.

If `\RawShipout` is used instead of `\shipout` then only the hooks `shipout/firstpage` and `shipout/lastpage` are executed (on the first or last page), all others are bypassed.

1.3 Legacy L^AT_EX commands

`\AtBeginDvi`
`\AtEndDvi`

`\AtBeginDvi` is the existing L^AT_EX 2_ε interface to fill the `shipout/firstpage` hook. This is not really a good name as it is not just supporting `.dvi` but also `.pdf` output or `.xdv`.

`\AtEndDvi` is the counterpart that was not available in the kernel but only through the package `atenddvi`. It fills the `shipout/lastpage` hook.

As these two wrappers have been available for a long time we continue offering them. However, for new code we suggest using the high-level hook management commands directly instead of “randomly-named” wrappers. This will lead to code that is easier to understand and to maintain. For this reason we do not provide any other wrapper commands for the above hooks in the kernel.

1.4 Special commands for use inside the hooks

`\DiscardShipoutBox`
`\shipout_discard:`

`\AddToHookNext {shipout/before} {...\DiscardShipoutBox...}`

The `\DiscardShipoutBox` declaration (L3 name `\shipout_discard:`) requests that on the next shipout the page box is thrown away instead of being shipped to the `.dvi` or `.pdf` file.

Typical applications wouldn't do this unconditionally, but have some processing logic that decides to use or not to use the page.

Note that if this declaration is used directly in the document it may depend on the placement to which page it applies, given that L^AT_EX output routine is called in an asynchronous manner! Thus normally one would use this only as part of the `shipout/before` code.

Todo: Once we have a new mark mechanism available we can improve on that and make sure that the declaration applies to the page that contains it.

In the `atbegshi` package there are a number of additional commands for use inside the `shipout/before` hook. They should normally not be needed any more as one can instead simply add code to the hooks `shipout/before`, `shipout/background` or `shipout/foreground`.²⁵ If `atbegshi` gets loaded then those commands become available as public functions with their original names as given below.

²⁵If that assumption turns out to be wrong it would be trivial to change them to public functions (right now they are private).

1.5 Provided LuaTeX callbacks

`pre_shipout_filter`

Under LuaTeX the `pre_shipout_filter` Lua callback is provided which gets called immediately before the shipout primitive gets invoked. The signature is

```
function(<node> head)
  return true
end
```

The `head` is the list node corresponding to the box to be shipped out. The return value should always be `true`.

1.6 Information counters

`\ReadonlyShipoutCounter`
`\g_shipout_readonly_int`

```
\ifnum\ReadonlyShipoutCounter=...
\int_use:N \g_shipout_readonly_int % expl3 usage
```

This integer holds the number of pages shipped out up to now (including the one to be shipped out when inside the output routine). More precisely, it is incremented only after it is clear that a page will be shipped out, i.e., after the `shipout/before` hook (because that might discard the page)! In contrast `shipout/after` sees the incremented value.

Just like with the `page` counter its value is only accurate within the output routine. In the body of the document it may be off by one as the output routine is called asynchronously!

Also important: it *must not* be set, only read. There are no provisions to prevent that restriction, but if you manipulate it, chaos will be the result. To emphasize this fact it is not provided as a L^AT_EX counter but as a T_EX counter (i.e., a command), so `\Alph{\ReadonlyShipoutCounter}` etc, would not work.

`totalpages`
`\g_shipout_totalpages_int`

```
\arabic{totalpages}
\int_use:N \g_shipout_totalpages_int % expl3 usage
```

In contrast to `\ReadonlyShipoutCounter`, the `totalpages` counter is a L^AT_EX counter and incremented for each shipout attempt including those pages that are discarded for one or the other reason. Again `shipout/before` sees the counter before it is incremented. In contrast `shipout/after` sees the incremented value.

Furthermore, while it is incremented for each page, its value is never used by L^AT_EX. It can therefore be freely reset or changed by user code, for example, to additionally count a number of pages that are not build by L^AT_EX but are added in a later part of the process, e.g., cover pages or picture pages made externally.

Important: as this is a page-related counter its value is only reliable inside the output routine!

`\PreviousTotalPages`

```
\thetotalpages/\PreviousTotalPages
```

Command that expands to the number of total pages from the previous run. If there was no previous run or if used in the preamble it expands to 0. Note that this is a command and not a counter, so in order to display the number in, say, Roman numerals you have to assign its value to a counter and then use `\Roman` on that counter.

1.7 Debugging shipout code

<code>\DebugShipoutsOn</code>	<code>\DebugShipoutsOn</code>
<code>\DebugShipoutsOff</code>	
<code>\shipout_debug_on:</code>	Turn the debugging of shipout code on or off. This displays changes made to the shipout data structures.
<code>\shipout_debug_off:</code>	

Todo: This needs some rationalizing and may not stay this way.

2 Emulating commands from other packages

The packages in this section are no longer necessary, but as they are used by other packages, they are emulated when they are explicitly loaded with `\usepackage` or `\RequirePackage`.

Please note that the emulation only happens if the package is explicitly requested, i.e., the commands documented below are not automatically available in the L^AT_EX kernel! If you write a new package we suggest to use the appropriate kernel hooks directly instead of loading the emulation.

2.1 Emulating atbegshi

<code>\AtBeginShipoutUpperLeft</code>	<code>\AddToHook {shipout/before}</code>
<code>\AtBeginShipoutUpperLeftForeground</code>	<code>{... \AtBeginShipoutUpperLeft{<code>}...}</code>

This adds a `picture` environment into the background of the shipout box expecting `<code>` to contain `picture` commands. The same effect can be obtained by simply using kernel features as follows:

`\AddToHook{shipout/background}{<code>}`

There is one technical difference: if `\AtBeginShipoutUpperLeft` is used several times each invocation is put into its own box inside the shipout box whereas all `<code>` going into `shipout/background` ends up all in the same box in the order it is added or sorted based on the rules for the hook chunks.

`\AtBeginShipoutUpperLeftForeground` is similar with the difference that the `picture` environment is placed in the foreground. To model it with the kernel functions use the hook `shipout/foreground` instead.

<code>\AtBeginShipoutAddToBox</code>	<code>\AddToHook {shipout/before} {... \AtBeginShipoutAddToBox{<code>}...}</code>
<code>\AtBeginShipoutAddToBoxForeground</code>	

These work like `\AtBeginShipoutUpperLeft` and `\AtBeginShipoutUpperLeftForeground` with the difference that `<code>` is directly placed into an `\hbox` inside the shipout box and not surrounded by a `picture` environment.

To emulate them using `shipout/background` or `shipout/foreground` you may have to wrap `<code>` into a `\put` statement but if the code is not doing any typesetting just adding it to the hook should be sufficient.

<code>\AtBeginShipoutBox</code>	This is the name of the shipout box as <code>atbegshi</code> knows it.
---------------------------------	------------------------------------------------------------------------

`\AtBeginShipoutOriginalShipout`

This is the name of the `\shipout` primitive as `atbegshi` knows it. This bypasses all the mechanisms set up by the \LaTeX kernel and there are various scenarios in which it can therefore fail. It should only be used to run existing legacy `atbegshi` code but not in newly developed applications.

The kernel alternative is `\RawShipout` which is integrated with the \LaTeX mechanisms and updates, for example, the `\ReadonlyShipoutCounter` counter. Please use `\RawShipout` for new code if you want to bypass the before, foreground and background hooks.

`\AtBeginShipoutInit`

By default `atbegshi` delayed its action until `\begin{document}`. This command was forcing it in an earlier place. With the new concept it does nothing.

`\AtBeginShipout`

`\AtBeginShipout{<code>} \equiv \AddToHook{shipout/before}{<code>}`

`\AtBeginShipoutNext`

`\AtBeginShipoutNext{<code>} \equiv \AddToHookNext{shipout/before}{<code>}`

This is equivalent to filling the `shipout/before` hook by either using `\AddToHook` or `\AddToHookNext`, respectively.

`\AtBeginShipoutFirst`

`\AtBeginShipoutDiscard`

The `atbegshi` names for `\AtBeginDvi` and `\DiscardShipoutBox`.

2.2 Emulating `everyshi`

The `everyshi` package is providing commands to run arbitrary code just before the `shipout` starts. One point of difference: in the new `shipout` hooks the page is available as `\ShipoutBox` for inspection of change, one should not manipulate box 255 directly inside `shipout/before`, so old code doing this would change to use `\ShipoutBox` instead of 255 or `\@cc1v`.

`\EveryShipout`

`\EveryShipout{<code>} \equiv \AddToHook{shipout/before}{<code>}`

`\AtNextShipout`

`\AtNextShipout{<code>} \equiv \AddToHookNext{shipout/before}{<code>}`

However, most use cases for `everyshi` are attempts to put some picture or text into the background or foreground of the page and that can be done today simply by using the `shipout/background` and `shipout/foreground` hooks without any need to coding.

2.3 Emulating `atenddvi`

The `atenddvi` package implemented only a single command: `\AtEndDvi` and that is now available out of the box so the emulation makes the package a no-op.

2.4 Emulating everypage

This package patched the original `\@begindvi` hook and replaced it with its own version. Its functionality is now covered by the hooks offered by the kernel so that there is no need for such patching any longer.

<code>\AddEverypageHook</code>	<code>\AddEverypageHook{<code>} ≡</code> <code>\AddToHook{shipout/background}{\put(1in,-1in){<code>}}</code>
--------------------------------	-----------------------------------------------------------------------------------------------------------------------------

`\AddEverypageHook` is adding something into the background of every page at a position of 1in to the right and 1in down from the top left corner of the page. By using the kernel hook directly you can put your material directly to the right place, i.e., use other coordinates in the `\put` statement above.

<code>\AddThispageHook</code>	<code>\AddThispageHook{<code>} ≡</code> <code>\AddToHookNext{shipout/background}{\put(1in,-1in){<code>}}</code>
-------------------------------	--------------------------------------------------------------------------------------------------------------------------------

The `\AddThispageHook` wrapper is similar but uses `\AddToHookNext`.

3 The Implementation

1 `<@@=shipout>`

At the moment the whole module rolls back in one go, but if we make any modifications in later releases this will then need splitting.

2 `<*2ekernel | latexrelease>`
3 `<latexrelease>\IncludeInRelease{2020/10/01}%`
4 `<latexrelease> \{<shipout>\{Hook management (shipout)\}%`
5 `\ExplSyntaxOn`

3.1 Debugging

<code>\g__shipout_debug_bool</code>	Holds the current debugging state. 6 <code>\bool_new:N \g__shipout_debug_bool</code>
-------------------------------------	-----------------------------------------------------------------------------------------

(End definition for `\g__shipout_debug_bool`.)

<code>\shipout_debug_on:</code> <code>\shipout_debug_off:</code> <code>__shipout_debug:n</code> <code>__shipout_debug_gset:</code>	Turns debugging on and off by redefining <code>__shipout_debug:n</code> . 7 <code>\cs_new_eq:NN __shipout_debug:n \use_none:n</code> 8 <code>\cs_new_protected:Npn \shipout_debug_on:</code> 9 <code>{</code> 10 <code>\bool_gset_true:N \g__shipout_debug_bool</code> 11 <code>__shipout_debug_gset:</code> 12 <code>}</code> 13 <code>\cs_new_protected:Npn \shipout_debug_off:</code> 14 <code>{</code> 15 <code>\bool_gset_false:N \g__shipout_debug_bool</code> 16 <code>__shipout_debug_gset:</code> 17 <code>}</code> 18 <code>\cs_new_protected:Npn __shipout_debug_gset:</code> 19 <code>{</code> 20 <code>\cs_gset_protected:Npx __shipout_debug:n ##1</code> 21 <code>{ \bool_if:NT \g__shipout_debug_bool {##1} }</code> 22 <code>}</code>
-----------------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

(End definition for `\shipout_debug_on:` and others. These functions are documented on page 789.)

`\ShipoutBox` The box filled with the page to be shipped out (both L3 and L^AT_EX 2_ε name).
`\l_shipout_box`

```
23 \box_new:N \l_shipout_box
24 \cs_set_eq:NN \ShipoutBox \l_shipout_box
```

(End definition for `\ShipoutBox` and `\l_shipout_box`. These functions are documented on page 785.)

`\l__shipout_raw_box` The `\RawShipout` gets its own box but it is internal as there is no hook manipulation for it.

```
25 \box_new:N \l__shipout_raw_box
```

(End definition for `\l__shipout_raw_box`.)

`__shipout_finalize_box:` For Lua_T_EX invoke the `pre_shipout_filter` callback.

```
26 \sys_if_engine luatex:TF
27 {
28   \newluafunction \__shipout_finalize_box:
29   \exp_args:Nx \everyjob {
30     \exp_not:V \everyjob
31     \exp_not:N \lua_now:n {
32       luatexbase.create_callback('pre_shipout_filter', 'list')
33       local~call, getbox, setbox = luatexbase.call_callback, tex.getbox, tex.setbox~
34       lua.get_functions_table()[\the \__shipout_finalize_box:] = function()
35         local~result = call('pre_shipout_filter', getbox(\the \l_shipout_box))
36         if~not (result == true) then~
37           setbox(\the \l_shipout_box, result~or~nil)
38         end~
39       end
40     }
41   }
42   \protected \luadef \__shipout_finalize_box: \the \__shipout_finalize_box:
43 } {
44   \cs_set_eq:NN \__shipout_finalize_box: \scan_stop:
45 }
```

(End definition for `__shipout_finalize_box:.`)

`__shipout_execute:` This is going to be the code run by `\shipout`. The code follows closely the ideas from `atbegshi`, so not documenting that here for now.

```
46 \cs_set_protected:Npn \__shipout_execute: {
47   \tl_set:Nx \l__shipout_group_level_tl
48   { \int_value:w \tex_currentgrouplevel:D }
49   \tex_afterassignment:D \__shipout_execute_test_level:
50   \tex_setbox:D \l_shipout_box
51 }
```

(End definition for `__shipout_execute:.`)

`\shipout` Overloading the `\shipout` primitive:

```
52 \cs_gset_eq:NN \shipout \__shipout_execute:
```

(End definition for `\shipout`. This function is documented on page 784.)

`\l__shipout_group_level_tl` Helper token list to record the group level at which `__shipout_execute:` is encountered.

```
53 \tl_new:N \l__shipout_group_level_tl
```

(End definition for `\l__shipout_group_level_tl`.)

`_shipout_execute_test_level:` If the group level has changed then we are still constructing `\l_shipout_box` and to continue we need to wait until the current group has finished, hence the `\tex_aftergroup:D`.

```
54 \cs_new:Npn \__shipout_execute_test_level: {
55   \int_compare:nNnT
56     \l__shipout_group_level_tl < \tex_currentgrouplevel:D
57     \tex_aftergroup:D \__shipout_execute_cont:
58 }
```

(End definition for `_shipout_execute_test_level:.`)

`__shipout_execute_cont:` This does the actual shipout running several hooks as part of it. The code for them is passed as argument #2 to #4 to `__shipout_execute_main_cont:Nnnn`; the first argument is the box to be shipped out.

```
59 \cs_new:Npn \__shipout_execute_cont: {
60   \__shipout_execute_main_cont:Nnnn
61   \l_shipout_box
62   { \hook_use:n {shipout/before} }
63   { \hook_if_empty:nF {shipout/foreground}
64     { \__shipout_add_foreground_picture:n
65       { \hook_use:n {shipout/foreground} } } }
```

If the user hook for the background (`shipout/background`) has no code, there might still code in the kernel hook so we need to test for this too. We only test for the `\@kernel@before@shipout@background` though. If the `\@kernel@after@shipout@background` needs executing even if the user hook is empty then we can add another test (or the kernel could put something into the before hook).

```
66   \bool_lazy_and:nnF
67     { \hook_if_empty_p:n {shipout/background} }
68     { \tl_if_empty_p:N \@kernel@before@shipout@background }
69     { \__shipout_add_background_picture:n
70       { \@kernel@before@shipout@background
71         \hook_use:n {shipout/background}
72         \@kernel@after@shipout@background }
73     }
74   }
75   { \hook_use:n {shipout/after} }
76 }
```

(End definition for `__shipout_execute_cont:.`)

`_shipout_execute_main_cont:Nnnn` When we have reached this point the shipout box has been processed and is available in `\l_shipout_box` and ready for real ship out (unless it gets discarded during the process).

The three arguments hold hook code that is executed just before the actual shipout (#1), within the shipout adding background and foreground material (#2) and after the shipout has happened (#3). These are passed as arguments because the same code without those hooks is also used when doing a “raw” shipout implemented by `\RawShipout`. The only hook that is always executed is that for the very last page, i.e., `shipout/lastpage`.

First we quickly check if it is void (can't happen in the standard L^AT_EX output routine but `\shipout` might be called from a package that has some special processing logic). If it is void we aren't shipping anything out and processing ends.²⁶

```

77 \cs_new:Npn \__shipout_execute_main_cont:Nnnn #1#2#3#4 {
78   \box_if_empty:NTF #1
79   { \@latex@warning{Ignoring~ void~ shipout~ box} }
80   {

```

Otherwise we assume that we will ship something and prepare for final adjustments (in particular setting the state of `\protect` while we are running the hook code). We also save the current `\protect` state to restore it later.

```

81 %       \bool_gset_false:N \g_shipout_discard_bool % setting this would disable
82                                     % \DiscardShipoutBox on doc-level
83       \cs_set_eq:NN \__shipout_saved_protect: \protect
84       \set@typeset@protect

```

We also store the current shipout box dimension in registers, so that they can be used in the hook code.²⁷

```

85       \__shipout_get_box_size:N #1

```

Then we execute the `shipout/before` hook (or nothing in case of `\RawShipout`).

```

86       #2

```

In `\g_shipout_totalpages_int` we count all shipout attempts so we increment that counter already here (the other one is incremented later when we know for sure that we do a `\shipout`).

We increment it after running the above hook so that the values for `\g_shipout_totalpages_int` and `\g_shipout_readonly_int` are in sync while the hook is executed (in the case that `totalpages` isn't manually altered or through discarding pages that is).

```

87       \int_gincr:N \g_shipout_totalpages_int

```

The above hook might contain code that requests the page to be discarded so we now test for it.

```

88       \bool_if:NTF \g_shipout_discard_bool
89       { \@latex@info@no@line{Completed~ page~ discarded}
90       \bool_gset_false:N \g_shipout_discard_bool

```

As we are discarding the page box and not shipping anything out, we need to do some house cleaning and reset T_EX's deadcycles so that it doesn't complain about too many calls to the OR without any shipout.

```

91       \tex_deadcycles:D \c_zero_int

```

Todo: In `atbegshi` the box was dropped but is that actually needed? Or the resetting of `\protect` to its kernel value?

```

92 %       \group_begin:
93 %       \box_set_eq_drop:NN #1 #1
94 %       \group_end:
95 %       \cs_set_eq:NN \protect \exp_not:N
96       }

```

²⁶In that case we don't reset the deadcycles, that would be up to the OR processing logic to do.

²⁷This is not really necessary as the code could access them via `\box_ht:N`, etc., but it is perhaps convenient.

Even if there was no explicit request to discard the box it is possible that the code for the hook `shipout/before` has voided the box (by mistake or deliberately). We therefore test once more but this time make it a warning, because the best practice way is to use the request mechanism.

```

97      { \box_if_empty:NTF #1
98        { \@latex@warning{
99          Shipout~ box~ was~ voided~ by~ hook,\MessageBreak
100          ignoring~ shipout~ box }
101        }

```

Finally, if the box is still non-empty we are nearly ready to ship it out. First we increment the total page counter so that we can later test if we have reached the final page according to our available information.²⁸

```

102      {
103        \int_gincr:N \g_shipout_readonly_int
104        \__shipout_debug:n {
105          \typeout{Absolute~ page~ =~ \int_use:N \g_shipout_readonly_int
106                  \space (target:~ \@abspage@last)}
107        }

```

Then we store the box sizes again (as they may have changed) and then look at the hooks `shipout/foreground` and `shipout/background`. If either or both are non-empty we add a `picture` environment to the box (in the foreground and/or in the background) and execute the hook code inside that environment.

```

108      \__shipout_get_box_size:N #1

```

The first hook we run is the `shipout/firstpage` hook. This is only done once, then the `__shipout_run_firstpage_hook:` command redefines itself to do nothing. If the hook contains `\specials` for integration at the top of the page they will be temporarily stored in a safe place and added later with `__shipout_add_firstpage_specials:`.

```

109      \__shipout_run_firstpage_hook:

```

Run the hooks for background and foreground or, if this is called by `\RawShipout`, copy the box `\l__shipout_raw_box` to `\l_shipout_box` so that firstpage and lastpage material gets added if necessary (that is always done to `\l_shipout_box`).

```

110      #3

```

We then run `__shipout_add_firstpage_specials:` that adds the content of the hook `shipout/firstpage` to the start of the first page (if non-empty). It is then redefined to do nothing on later pages.

```

111      \__shipout_add_firstpage_specials:

```

Then we check if we have to add the `shipout/lastpage` hook or the corresponding kernel hook because we have reached the last page. This test will be false for all but one (and hopefully the correct) page.

```

112      \int_compare:nNnT \@abspage@last = \g_shipout_readonly_int
113      { \bool_lazy_and:nnF
114        { \hook_if_empty_p:n {shipout/lastpage} }
115        { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
116        { \__shipout_debug:n { \typeout{Executing~ lastpage~ hook~
117                                on~ page~ \int_use:N \g_shipout_readonly_int } }
118        \__shipout_add_foreground_box:n

```

²⁸Doing that earlier would be wrong because we might end up with the last page counted but discard and then we have no place to add the final objects into the output file.

```

119             { \UseHook{shipout/lastpage}
120               \@kernel@after@shipout@lastpage }
121           }
122           \bool_gset_true:N \g__shipout_lastpage_handled_bool
123         }
124         \__shipout_finalize_box:

```

Finally we run the actual \TeX primitive for shipout. As that will expand delayed \write statements inside the page in which protected commands should not expand we first change \protect to the appropriate definition for that case.

```

125         \cs_set_eq:NN \protect \exp_not:N
126         \tex_shipout:D \box_use:N \l_shipout_box

```

The \l_shipout_box may contain the firstpage material if this was the very first shipout. That makes it unsuitable for reuse in another shipout, so as a safety measure the next command resets \l_shipout_box to its earlier state if that is necessary. On later pages this is then a no-op.

```

127         \__shipout_drop_firstpage_specials:

```

The \shipout/after hook (if in #4) needs to run with \protected commands again being executed, because that hook will “typeset” material added at the top of the next page.

```

128         \set@typeset@protect
129         #4
130       }
131     }

```

Restore the value of \protect in case \shipout is called outside of the output routine (where it is automatically restored because of the implicit group).

```

132     \cs_set_eq:NN \protect \__shipout_saved_protect:
133   }
134 }

```

(End definition for $\text{__shipout_execute_main_cont:Nnnn}$.)

$\text{__shipout_execute_raw:}$ This implements the “raw” shipout which bypasses the before, foreground, background and after hooks. It follows the same pattern than $\text{__shipout_execute_raw:}$ except that it finally calls $\text{__shipout_execute_main_cont:Nnnn}$ with three empty arguments. instead of the hook code.

```

135 \cs_set_protected:Npn \__shipout_execute_raw: {
136   \tl_set:Nx \l__shipout_group_level_tl
137   { \int_value:w \tex_currentgrouplevel:D }
138   \tex_afterassignment:D \__shipout_execute_test_level_raw:
139   \tex_setbox:D \l__shipout_raw_box
140 }
141 \cs_new:Npn \__shipout_execute_test_level_raw: {
142   \int_compare:nNnT
143     \l__shipout_group_level_tl < \tex_currentgrouplevel:D
144     \tex_aftergroup:D \__shipout_execute_nohooks_cont:
145 }

```

Well, not totally empty arguments, we add some debugging if we are actually doing a shipout.

```

146 \cs_new:Npn \__shipout_execute_nohooks_cont: {
147   \__shipout_execute_main_cont:Nnnn \l__shipout_raw_box
148   {} { \__shipout_debug:n{ \typeout{Doing~ raw~ shipout~ ...} } }

```

```

149         \box_set_eq:NN \l_shipout_box \l__shipout_raw_box } {}
150     }

(End definition for \__shipout_execute_raw: and \__shipout_execute_test_level_raw:.)

```

\RawShipout The interface name for raw shipout.

```

151 \cs_gset_eq:NN \RawShipout \__shipout_execute_raw:

(End definition for \RawShipout. This function is documented on page 784.)

```

__shipout_saved_protect: Remember the current `\protect` state.

```

152 \cs_new_eq:NN \__shipout_saved_protect: \protect

(End definition for \__shipout_saved_protect:.)

```

shipout/before Declaring all hooks for the shipout code.

shipout/after

shipout/foreground

shipout/background

shipout/firstpage

shipout/lastpage

```

153 \hook_new:n{shipout/before}
154 \hook_new:n{shipout/after}
155 \hook_new:n{shipout/foreground}
156 \hook_new:n{shipout/background}
157 \hook_new:n{shipout/firstpage}
158 \hook_new:n{shipout/lastpage}

(End definition for shipout/before and others. These functions are documented on page 785.)

```

\@kernel@after@shipout@lastpage And here are the internal kernel hooks going before or after the public ones where needed.

\@kernel@before@shipout@background

\@kernel@after@shipout@background

```

159 \let\@kernel@after@shipout@lastpage\@empty
160 \let\@kernel@before@shipout@background\@empty
161 \let\@kernel@after@shipout@background\@empty

(End definition for \@kernel@after@shipout@lastpage, \@kernel@before@shipout@background, and \@kernel@after@shipout@background.)

```

__shipout_run_firstpage_hook: There are three commands to handle the `shipout/firstpage` hook: `__shipout_run_firstpage_hook:`, `__shipout_add_firstpage_specials:` and `__shipout_drop_firstpage_specials:`.

That hook is supposed to contain `\specials` and similar material to be placed at the very beginning of the output page and so it needs careful placing to avoid that anything else gets in front of it. And this means we have to wait with this until other hooks such as `shipout/background` have added their bits. It is also important that such `\specials` show up only on the very first page, so if this page gets saved before `\shipout` for later reuse, we have to make sure that they aren't in the saved version.

In addition the hook may also contain code to be executed “first”, e.g., visible from code in `shipout/background` and this conflicts with adding the `\specials` late.

Therefore the processing is split into different parts: `__shipout_run_firstpage_hook:` is done early and checks if there is any material in the hook.

```

162 \cs_new:Npn \__shipout_run_firstpage_hook: {
163     \hook_if_empty:nTF {shipout/firstpage}

If not then we define the other two commands to do nothing.

164     {
165         \cs_gset_eq:NN \__shipout_add_firstpage_specials: \prg_do_nothing:
166         \cs_gset_eq:NN \__shipout_drop_firstpage_specials: \prg_do_nothing:
167     }

```

If there is material we execute inside a box, which means any `\special` will end up in that box and any other code is executed and can have side effects (as long as they are global).

```

168     {
169     \hbox_set:Nn \l__shipout_firstpage_box { \UseHook{shipout/firstpage} }
170     }

```

Once we are here we change the definition to do nothing next time and we also change the command used to implement `\AtBeginDvi` to become a warning and not add further material to a hook that is never used again.

```

171 \cs_gset_eq:NN \__shipout_run_firstpage_hook: \prg_do_nothing:
172 \cs_gset:Npn \__shipout_add_firstpage_material:Nn ##1 ##2 {
173   \@latex@warning{
174     First~ page~ is~ already~ shipped~ out,~ ignoring\MessageBreak
175     \string##1 }
176   }
177 }

```

(End definition for `__shipout_run_firstpage_hook:.`)

`__shipout_add_firstpage_specials:`
`__shipout_drop_firstpage_specials:`

The `__shipout_add_firstpage_specials:` then adds the `\specials` stored in `\l__shipout_firstpage_box` to the page to be shipped out when the time is ready. Note that if there was no material in the `shipout/firstpage` hook then this command gets redefined to do nothing. But for most documents there is something, e.g., some PostScript header, or some meta data declaration, etc. so by default we assume there is something to do.

```

178 \cs_new:Npn \__shipout_add_firstpage_specials: {

```

First we make a copy of the `\l_shipout_box` that we can restore it later on.

```

179 \box_set_eq:NN \l__shipout_raw_box \l_shipout_box

```

Adding something to the beginning means adding it to the background as that layer is done first in the output.

```

180 \__shipout_add_background_box:n { \hbox_unpack_drop:N \l__shipout_firstpage_box }

```

After the actual shipout `__shipout_drop_firstpage_specials:` is run to restore the earlier content of `\l_shipout_box` and then redefines itself again to do nothing.

As a final act we change the definition to do nothing next time.

```

181 \cs_gset_eq:NN \__shipout_add_firstpage_specials: \prg_do_nothing:
182 }

```

The `__shipout_drop_firstpage_specials:` is run after the shipout has occurred but before the `shipout/afterpage` hook is executed. That is the point where we have to restore the `\ShipoutBox` to its state without the `shipout/firstpage` material.

```

183 \cs_new:Npn \__shipout_drop_firstpage_specials: {
184   \box_set_eq:NN \l_shipout_box \l__shipout_raw_box

```

If there was no such material then `__shipout_run_firstpage_hook:` will have changed the definition to a no-op already. Otherwise this is what we do here.

```

185   \cs_gset_eq:NN \__shipout_drop_firstpage_specials: \prg_do_nothing:
186 }

```

(End definition for `__shipout_add_firstpage_specials:` and `__shipout_drop_firstpage_specials:.`)

`\l__shipout_firstpage_box` The box to hold any firstpage `\specials`.

```

187 \box_new:N \l__shipout_firstpage_box

(End definition for \l__shipout_firstpage_box.)

```

`\g__shipout_lastpage_handled_bool` A boolean to signal if we have already handled the `shipout/lastpage` hook.

```

188 \bool_new:N \g__shipout_lastpage_handled_bool

(End definition for \g__shipout_lastpage_handled_bool.)

```

`__shipout_add_firstpage_material:Nn` This command adds material to the `shipout/firstpage` hook. It is used in `\AtBeginDvi`, etc. The first argument is the command through which it is called. Initially this is ignored but once we are passed the first page it can be used to generate a warning message mentioning the right user command.

```

189 \cs_new:Npn \__shipout_add_firstpage_material:Nn #1#2 {
190   \AddToHook{shipout/firstpage}{#2}
191 }

(End definition for \__shipout_add_firstpage_material:Nn.)

```

`__shipout_get_box_size:N` Store the box dimensions in dimen registers.

Todo: This could/should perhaps be generalized to set height depth and width given an arbitrary box.

```

192 \cs_new:Npn \__shipout_get_box_size:N #1 {
193   \dim_set:Nn \l_shipout_box_ht_dim { \box_ht:N #1 }
194   \dim_set:Nn \l_shipout_box_dp_dim { \box_dp:N #1 }
195   \dim_set:Nn \l_shipout_box_wd_dim { \box_wd:N #1 }
196   \dim_set:Nn \l_shipout_box_ht_plus_dp_dim
197     { \l_shipout_box_ht_dim + \l_shipout_box_dp_dim }
198 }

(End definition for \__shipout_get_box_size:N.)

```

`\l_shipout_box_ht_dim`
`\l_shipout_box_dp_dim`
`\l_shipout_box_wd_dim`
`\l_shipout_box_ht_plus_dp_dim`

And here are the variables set by `__shipout_get_box_size:N`.

```

199 \dim_new:N \l_shipout_box_ht_dim
200 \dim_new:N \l_shipout_box_dp_dim
201 \dim_new:N \l_shipout_box_wd_dim
202 \dim_new:N \l_shipout_box_ht_plus_dp_dim

(End definition for \l_shipout_box_ht_dim and others. These functions are documented on page 785.)

```

`\g__shipout_discard_bool` Indicate whether or not the current page box should be discarded

```

203 \bool_new:N \g__shipout_discard_bool

(End definition for \g__shipout_discard_bool.)

```

`\l__shipout_tmp_box`
`\l__shipout_saved_badness_tl`

We need a box for the background and foreground material and a token register to remember badness settings as we disable them during the buildup below.

```

204 \box_new:N \l__shipout_tmp_box
205 \tl_new:N \l__shipout_saved_badness_tl

(End definition for \l__shipout_tmp_box and \l__shipout_saved_badness_tl.)

```

`_shipout_add_background_box:n` In standard L^AT_EX the shipout box is always a `\vbox` but here we allow for other usage as well, in case some package has its own output routine.

```
206 \cs_new:Npn \_shipout_add_background_box:n #1
207 { \_shipout_get_box_size:N \l_shipout_box
```

But we start testing for a vertical box as that should be the normal case.

```
208 \box_if_vertical:NTF \l_shipout_box
209 {
```

Save current values of `\vfuzz` and `\vbadness` then change them to allow box manipulations without warnings.

```
210 \tl_set:Nx \l__shipout_saved_badness_tl
211 { \vfuzz=\the\vfuzz\relax
212 \vbadness=\the\vbadness\relax }
213 \vfuzz=\c_max_dim
214 \vbadness=\c_max_int
```

Then we reconstruct `\l_shipout_box` ...

```
215 \vbox_set_to_ht:Nnn \l_shipout_box \l_shipout_box_ht_plus_dp_dim
216 {
```

... the material in #1 is placed into a horizontal box with zero dimensions.

```
217 \hbox_set:Nn \l__shipout_tmp_box
218 { \l__shipout_saved_badness_tl #1 }
219 \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
220 \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
221 \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
```

Then we typeset that box followed by whatever was in `\l_shipout_box` before (unpacked).

```
222 \skip_zero:N \baselineskip
223 \skip_zero:N \lineskip
224 \skip_zero:N \lineskiplimit
225 \box_use:N \l__shipout_tmp_box
226 \vbox_unpack:N \l_shipout_box
```

The `\kern` ensures that the box has no depth which is afterwards explicitly corrected.

```
227 \kern \c_zero_dim
228 }
229 \box_set_ht:Nn \l_shipout_box \l_shipout_box_ht_dim
230 \box_set_dp:Nn \l_shipout_box \l_shipout_box_dp_dim
```

Todo: The whole boxing maneuver looks a bit like overkill to me, but for the moment I leave.

```
231 \l__shipout_saved_badness_tl
232 }
233 {
```

A horizontal box is handled in a similar way. The last case would be a void box in which case we do nothing hence the missing F branch.

```
234 \box_if_horizontal:NT \l_shipout_box
235 {
236 \tl_set:Nx \l__shipout_saved_badness_tl
237 { \hfuzz=\the\hfuzz\relax
238 \hbadness=\the\hbadness\relax }
239 \hfuzz=\c_max_dim
```

```

240         \hbadness=\c_max_int
241         \hbox_set_to_wd:Nnn \l_shipout_box \l_shipout_box_wd_dim
242         {
243             \hbox_set:Nn \l__shipout_tmp_box
244                 { \l__shipout_saved_badness_tl #1 }
245             \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
246             \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
247             \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
248             \box_move_up:nn
249                 \l_shipout_box_ht_dim
250             { \box_use:N \l__shipout_tmp_box }
251             \hbox_unpack:N \l_shipout_box
252         }
253         \l__shipout_saved_badness_tl
254     }
255 }
256 }

```

(End definition for __shipout_add_background_box:n.)

__shipout_add_foreground_box:n Foreground boxes are done in the same way, only the order and placement of boxes has to be done differently.

```

257 \cs_new:Npn \__shipout_add_foreground_box:n #1
258 {
259     \box_if_vertical:NTF \l_shipout_box
260     {
261         \tl_set:Nx \l__shipout_saved_badness_tl

```

(End definition for `__shipout_add_foreground_box:n`.)

```

\__shipout_init_page_origins:
\c__shipout_horigin_tl
\c__shipout_vorigin_tl

```

Two constants holding the offset of the top-left with respect to the media box.

Setting the constants this way is courtesy of Bruno.

We delay setting the constants to the last possible place as there might be updates in the preamble or even in the `begindocument` hook that affects their setup.

```

310 \cs_new:Npn \__shipout_init_page_origins: {
311   \tl_const:Nx \c__shipout_horigin_tl
312   {
313     \cs_if_exist_use:NTF \pdfvariable { horigin }
314     { \cs_if_exist_use:NF \pdfhorigin { 1in } }
315   }
316   \tl_const:Nx \c__shipout_vorigin_tl
317   {
318     \cs_if_exist_use:NTF \pdfvariable { vorigin }
319     { \cs_if_exist_use:NF \pdfvorigin { 1in } }
320   }

```

After the constants have been set there is no need to execute this command again, in fact it would raise an error, so we redefine it to do nothing.

```

321   \cs_gset_eq:NN \__shipout_init_page_origins: \prg_do_nothing:
322 }

```

(End definition for `__shipout_init_page_origins:`, `\c__shipout_horigin_tl`, and `\c__shipout_vorigin_tl`.)

`__shipout_picture_overlay:n` Put the argument into a `picture` environment that doesn't take up any size and uses `1pt` for `\unitlength`.

Todo: Could perhaps be generalized as it might be useful elsewhere. For now it is not.

```

323 \cs_new:Npn \__shipout_picture_overlay:n #1 {

```

The very first time this is executed we have to initialize (and freeze) the origins.

```

324   \__shipout_init_page_origins:
325   \kern -\c__shipout_horigin_tl \scan_stop:
326   \vbox_to_zero:n {
327     \kern -\c__shipout_vorigin_tl \scan_stop:
328     \unitlength 1pt \scan_stop:

```

This mimics a simple zero-sized picture environment. The `\hss` is need in case there is horizontal material (without using `\put` with a positive width.

```

329     \hbox_set_to_wd:Nnn \l__shipout_tmp_box \c_zero_dim
330     { \ignorespaces #1 \hss }
331     \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
332     \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
333     \box_use:N \l__shipout_tmp_box
334     \tex_vss:D
335   }
336 }

```

(End definition for `__shipout_picture_overlay:n`.)

`__shipout_add_background_picture:n` Put a `picture` env in the background of the shipout box with its reference point in the top-left corner.

```

337 \cs_new:Npn \__shipout_add_background_picture:n #1 {
338   \__shipout_add_background_box:n { \__shipout_picture_overlay:n {#1} }
339 }

```

(End definition for `__shipout_add_background_picture:n`.)

`__shipout_add_foreground_picture:n` Put a `picture` env in the foreground of the shipout box with its reference point in the top-left corner.

```

340 \cs_new:Npn \__shipout_add_foreground_picture:n #1 {
341   \__shipout_add_foreground_box:n { \__shipout_picture_overlay:n {#1} }
342 }

```

(End definition for `__shipout_add_foreground_picture:n`.)

`\shipout_discard:` Request that the next shipout box should be discarded. At the moment this is just setting a boolean, but we may want to augment this behavior that the position of the call is taken into account (in case \LaTeX looks ahead and is not using the position for on the next page).

```

343 \cs_new_protected:Npn \shipout_discard: {
344   \bool_gset_true:N \g__shipout_discard_bool
345 }

```

(End definition for `\shipout_discard:`. This function is documented on page 787.)

3.2 Handling the end of job hook

At the moment this is partly solved by using the existing hooks. But rather than putting the code into these hooks it should be moved to the right place directly as we shouldn't prefill hooks with material unless it needs to interact with other code.

```
\g_shipout_readonly_int \ReadonlyShipoutCounter
```

We count every shipout activity that makes a page (but not those that are discarded) in order to know how many pages got produced.

```
346 \int_new:N \g_shipout_readonly_int
```

For L^AT_EX 2_ε it is available as a command (i.e., a T_EX counter only).

```
347 \cs_new_eq:NN \ReadonlyShipoutCounter \g_shipout_readonly_int
```

(End definition for `\g_shipout_readonly_int` and `\ReadonlyShipoutCounter`. These functions are documented on page 788.)

```
\g_shipout_totalpages_int \c@totalpages
```

We count every shipout attempt (even those that are discarded) in this counter. It is not used in the code but may get used in user code.

```
348 \int_new:N \g_shipout_totalpages_int
```

For L^AT_EX 2_ε this is offered as a L^AT_EX counter so can be easily typeset inside the output routine to display things like “`\thepage/\thetotalpages`”, etc.

```
349 \cs_new_eq:NN \c@totalpages \g_shipout_totalpages_int
350 \cs_new:Npn \thetotalpages { \arabic{totalpages} }
```

(End definition for `\g_shipout_totalpages_int` and `\c@totalpages`. These functions are documented on page 788.)

```
\@abspage@last
```

In `\@abspage@last` record the number of pages from the last run. This is written to the `.aux` and this way made available to the next run. In case there is no `.aux` file or the statement is missing from it we initialize it with the largest possible number in T_EX. We use this as the default because then we are inserting the `shipout/lastpage` on the last page (or after the last page) but not on page 1 for a multipage document.

```
351 \xdef\@abspage@last{\number\maxdimen}
```

(End definition for `\@abspage@last`.)

```
\enddocument
```

Instead of using the hooks `enddocument` and `enddocument/afterlastpage` we add this code to private kernel hooks to be 100% sure when it is executed and to avoid cluttering the hooks with data that is always there.

Inside `\enddocument` there is a `\clearpage`. Just before that we execute this code here. There is a good chance that we are on the last page. Therefore, if we don't know the value from the last run, we assume that the current page is the right one. So we set `\@abspage@last` and as a result the next shipout will run the `shipout/lastpage` code. Of course, if there are floats that still need a placement this guess will be wrong but then rerunning the document will give us the correct value next time around.

```
\@kernel@after@enddocument
```

```
352 \g@addto@macro \@kernel@after@enddocument {
353   \int_compare:nNnT \@abspage@last = \maxdimen
354     {
We use LATEX 2ε coding as \@abspage@last is not an L3 name.
355     \xdef\@abspage@last{ \int_eval:n {\g_shipout_readonly_int + 1} }
356   }
357 }
```

Once the `\clearpage` has done its work inside `\enddocument` we know for sure how many pages this document has, so we record that in the `.aux` file for the next run.

```
358 \g@addto@macro \@kernel@after@enddocument@afterlastpage {
```

There is one special case: If no output is produced then there is no point in a) recording the number as 0 will never match the page number of a real page and b) adding an extra page to run the `shipout/lastpage` is pointless as well (as it would remain forever). So we test for this and run the code only if there have been pages.

```
359 \int_compare:nNf \g_shipout_readonly_int = 0
360 {
```

This ends up in the `.aux` so we use L^AT_EX 2_ε names here.

Todo: This needs an interface for `\nofiles` in `expl3`, doesn't at the moment!

```
361 \if@filesw
362 \iow_now:Nx \@auxout {
363 \gdef\string\@abspage@last {\int_use:N \g_shipout_readonly_int}}
364 \fi
```

But we may have guessed wrongly earlier and we still have to run the `shipout/lastpage` even though there is no page to place it into. If that is the case we make a trivial extra page and put it there. This temporary page will then vanish again on the next run but helps to keep pdf viewers happy.

```
365 \bool_if:Nf \g__shipout_lastpage_handled_bool
366 {
```

However, making this extra page in case the hook is actually empty would be forcing a rerun without any reason, so we check that condition and also check if `\@kernel@after@shipout@lastpage` contains any code. If both are empty we omit the page generation.

```
367 \bool_lazy_and:nnF
368 { \hook_if_empty_p:n {shipout/lastpage} }
369 { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
370 {
371 \tex_shipout:D\ vbox to\textheight
372 {
373 \hbox:n { \UseHook{shipout/lastpage}
374 \@kernel@after@shipout@lastpage }
375 }
```

This extra page could be totally empty except for the hook content, but to help the user understanding why it is there we put some text into it.

```
375 \__shipout_excuse_extra_page:
376 \null
377 }
```

At this point we also signal to L^AT_EX's endgame that a rerun is necessary so that an appropriate message can be shown on the terminal. We do this by simply defining a command used as a flag and tested in `\enddocument`.

```
378 \cs_gset_eq:NN \@extra@page@added \relax
379 }
380 }
381 }
382 }
```

(End definition for `\enddocument`, `\@kernel@after@enddocument`, and `\@kernel@after@enddocument@afterlastpage`.)

`_shipout_excuse_extra_page:` Say mea culpa ...

```

383 \cs_new:Npn \_shipout_excuse_extra_page: {
384   \vfil
385   \begin{center}
386     \bfseries Temporary~ page!
387   \end{center}
388   \LaTeX{}~ was~ unable~ to~ guess~ the~ total~ number~ of~ pages~
389   correctly.~ ~ As~ there~ was~ some~ unprocessed~ data~ that~
390   should~ have~ been~ added~ to~ the~ final~ page~ this~ extra~
391   page~ has~ been~ added~ to~ receive~ it.
392   \par
393   If~ you~ rerun~ the~ document~ (without~ altering~ it)~ this~
394   surplus~ page~ will~ go~ away,~ because~ \LaTeX{}~ now~ knows~
395   how~ many~ pages~ to~ expect~ for~ this~ document.
396   \vfil
397 }
```

(End definition for `_shipout_excuse_extra_page:.`)

`\PreviousTotalPages`

In the preamble before the aux file was read `\PreviousTotalPages` is always zero.

`\@kernel@before@begindocument`

```

398 \def\PreviousTotalPages{0}
```

In the aux file there should be an update for `\@abspage@last` recording the number of pages from the previous run. If not that macro holds the value of `\maxdimen`. So we test for it and update `\PreviousTotalPages` if there was a real value. This should happen just before the `begindocument` hook is executed so that the value can be used inside that hook.

```

399 \g@addto@macro\@kernel@before@begindocument
400   {\ifnum\@abspage@last<\maxdimen
401     \xdef\PreviousTotalPages{\@abspage@last}\fi}
```

(End definition for `\PreviousTotalPages` and `\@kernel@before@begindocument`. These functions are documented on page 788.)

4 Legacy L^AT_EX 2_ε interfaces

`\DiscardShipoutBox`

Request that the next shipout box is to be discarded.

```

402 \cs_new_eq:NN \DiscardShipoutBox \shipout_discard:
```

(End definition for `\DiscardShipoutBox`. This function is documented on page 787.)

`\AtBeginDvi`

If we roll forward from an earlier kernel `\AtBeginDvi` is defined so we better not use `\cs_new_protected:Npn` here.

```

403 \cs_set_protected:Npn \AtBeginDvi
404   {\_shipout_add_firstpage_material:Nn \AtBeginDvi}
```

(End definition for `\AtBeginDvi`. This function is documented on page 787.)

`\DebugShipoutsOn`

`\DebugShipoutsOff`

```

405 \cs_new_eq:NN \DebugShipoutsOn \shipout_debug_on:
406 \cs_new_eq:NN \DebugShipoutsOff \shipout_debug_off:
```

(End definition for `\DebugShipoutsOn` and `\DebugShipoutsOff`. These functions are documented on page 789.)

5 Internal commands needed elsewhere

```

(End definition for `\AtBeginShipoutAddToBox` and others. These functions are documented on page 789.)

`\AtBeginShipoutOriginalShipout` This offers the raw `\shipout` primitive of the engine. A page shipped out with this is not counted by `\ReadonlyShipoutCounter` counter and thus the mechanism to place `\specials` at the very end of the output might fail, etc. It should therefore not be used in new applications but is only provided to allow running legacy code. For new code use the commands provided by the kernel instead.

```
500 \ExplSyntaxOn
501 \cs_new_eq:NN \AtBeginShipoutOriginalShipout \tex_shipout:D
```

(End definition for `\AtBeginShipoutOriginalShipout`. This function is documented on page 790.)

`\ShipoutBoxHeight` `\ShipoutBoxWidth` `\ShipoutBoxDepth` This is somewhat different from the original in `atbegshi` where `\ShipoutBoxHeight` etc. only holds the `\the\ht<box>` value. This may have some implications in some use cases and if that is a problem then it might need changing.

```
502 \cs_new:Npn \ShipoutBoxHeight { \dim_use:N \l_shipout_box_ht_dim }
503 \cs_new:Npn \ShipoutBoxDepth { \dim_use:N \l_shipout_box_dp_dim }
504 \cs_new:Npn \ShipoutBoxWidth { \dim_use:N \l_shipout_box_wd_dim }
505 \ExplSyntaxOff
```

(End definition for `\ShipoutBoxHeight`, `\ShipoutBoxWidth`, and `\ShipoutBoxDepth`.)

```
506 </atbegshi-ltx>
```

If the package is requested we substitute the one above:

```
507 <*2kernel>
508 \declare@file@substitution{atbegshi.sty}{atbegshi-ltx.sty}
509 </2kernel>
```

6.3 Package **everyshi** emulation

This is now directly handled in that package so emulation is not necessary any more.

Rather important :-)

```
510 <@@=>
```

File T

ltoutput.dtx

1 Output Routine

1.1 Floats

The ‘2ekernel’ code ensures that a `\usepackage{autoout1}` is essentially ignored if a ‘full’ format is being used that has the autoload file mode already in the format.

```

1 <defx>\begingroup
2 <defx>\makeatletter
3 <defx>\nfss@catcodes
4 <2ekernel>\expandafter\let\csname ver@autoout1.sty\endcsname\fmtversion

```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```

5 <*2ekernel>
6 \message{output,}

```

PAGE LAYOUT PARAMETERS

```

\topmargin      : Extra space added to top of page.
@twoside        : boolean. T if two-sided printing
\oddsidemargin  : IF @twoside = T
                  THEN extra space added to left of odd-numbered
                  pages.
                  ELSE extra space added to left of all pages.
\evensidemargin : IF @twoside = T
                  THEN extra space added to left of even-numbered
                  pages.

\headheight     : height of head
\headsep        : separation between head and text
\footskip       : distance separation between baseline of last
                  line of text and baseline of foot.
                  Note difference between \footSKIP and \headSEP.
\textheight     : height of text on page, excluding head and foot
\textwidth      : width of printing on page
\columnsep      : IF @twocolumn = T
                  THEN width of space between columns
\columnseprule  : IF @twocolumn = T
                  THEN width of rule between columns (0 if none).
\columnwidth    : IF @twocolumn = T
                  THEN (\textwidth - \columnsep)/2
                  ELSE \textwidth
                  It is set by the \twocolumn and
                  \onecolumn commands.

```

`\@textbottom` : Command executed at bottom of vbox holding text of page (including figures). The `\raggedbottom` command almost `\let's` this to `\vfil` (actually sets it to `\vskip \z@ plus.0001fil`). Should have depth 0pt.

`\@texttop` : Command executed at top of vbox holding text of page (including figures). Used by letter style; can also be used to produce centered pages. Let to `\relax` by `\raggedbottom` and `\flushbottom`.

Page layout must initialize `\@colht` and `\@colroom` to `\textheight`.

PAGE STYLE PARAMETERS:

`\floatsep` : Space left between floats.

`\textfloatsep` : Space between last top float or first bottom float and the text.

`\topfigrule` : Command to place rule (or whatever) between floats at top of page and text. Executed in inner vertical mode right before the `\textfloatsep` skip separating the floats from the text. Must occupy zero vertical space. (See `\footnoterule`.)

`\botfigrule` : Same as `\topfigrule`, but put after the `\textfloatsep` skip separating text from the floats at bottom of page.

`\intextsep` : Space left on top and bottom of an in-text float.

`\dblfloatsep` : Space between double-column floats.

`\dbltextfloatsep` : Space between top double-column floats and text.

`\dblfigrule` : Similar to `\topfigrule`, but for double-column floats.

`\@fptop` : Glue to go at top of float column – must be 0pt + stretch

`\@fpsep` : Glue to go between floats in a float column.

`\@fpbot` : Glue to go at bottom of float column
– must be 0pt + stretch

`\@dblfpsep`, `\@dblfpbot` : Analogous for double-column float page in two-column format.

FOOTNOTES: As in PLAIN, footnotes use `\insert\footins`.

PAGE LAYOUT SWITCHES AND MACROS

`@twocolumn` : Boolean. T if two columns per page globally.

PAGE STYLE MACROS AND SWITCHES

```

\@oddhead      : IF @twoside = T
                  THEN macro to generate head of odd-numbered
                  pages.
                  ELSE macro to generate head of all pages.
\@evenhead     : IF @twoside = T
                  THEN macro to generate head of even-numbered
                  pages.
\@oddfoot      : IF @twoside = T
                  THEN macro to generate foot of odd-numbered
                  pages.
                  ELSE macro to generate foot of all pages.
\@evenfoot     : IF @twoside = T
                  THEN macro to generate foot of even-numbered
                  pages.
@specialpage   : boolean. T if current page is to have a special
                  format.
\@specialstyle : If its value is foo then
                  IF @specialpage = T
                  THEN the command \ps@foo is executed to
                  temporarily reset the page style parameters
                  before composing the current page.
                  This command should execute only \def's and
                  \edef's, making only local definitions.

```

FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro `\@floatplacement`.
When `\@floatplacement` is called,

`\@colht` is the height of the page or column being built. I.e.:

- * For single-column page it equals `\textheight`.
- * For double-column page it equals `\textheight - height`
of double-column floats on page.

Note that some are set globally and some locally:

```

\@topnum      :=G Maximum number of floats allowed on the top of a
                  column.
\@toproom     :=G Maximum amount of top of column devoted to floats—
                  excluding \textfloatsep separation below the floats
                  and \floatsep separation between them. For
                  two-column output, should be computed as a function
                  of \@colht.
\@botnum, \@botroom
                  : Analogous to above.
\@colnum      :=G Maximum number of floats allowed in a column,
                  including in-text floats.
\@textmin     :=L Minimum amount of text (excluding footnotes) that
                  must appear on a text page.
                  %% 27 Sep 85 : made local to
                  %% \@addtocurcol and \@addtonextcol
                  It is now also used locally in processing double
                  floats.

```

`\@fpmin` :=L Minimum height of floats in a float column.

The macro `\@dblfloatplacement` sets the following parameters.

`\@dbltopnum` :=G Maximum number of double-column floats allowed at the top of a two-column page.

`\@dbltoproom` :=G Maximum height of double-column floats allowed at top of two-column page.

`\@fpmin` :=L Minimum height of floats in a float column.

It should also perform the following local assignments where necessary – i.e., where the new value differs from the old one:

`\@fptop` :=L `\@dblfpptop`

`\@fpsep` :=L `\@dblfpsep`

`\@fpbot` :=L `\@dblfpbot`

OUTPUT ROUTINE VARIABLES

`\@colht` : The total height of the current column. In single column style, it equals `\textheight`. In two-column style, it is `\textheight` minus the height of the double-column floats on the current page. MUST BE INITIALIZED TO `\textheight`.

`\@colroom` : The height available in the current column for text and footnotes. It equals `\@colht` minus the height of all floats committed to the top and bottom of the current column.

`\@textfloatsheight` : The total height of in-text floats on the current page.

`\footins` : Footnote insertion number.

`\@maxdepth` : Saved value of TeX's `\maxdepth`. Must be set when any routine sets `\maxdepth`.

CALLING THE OUTPUT ROUTINE

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty $<$ or $= -10000$ in the output list. In the latter case, the penalty indicates why the output routine was called, using the following code.

penalty	reason
-10000	<code>\pagebreak</code> <code>\newpage</code>
-10001	<code>\clearpage</code> (<code>\penalty -10000 \vbox{}</code> <code>\penalty -10001</code>)
-10002	float insertion, called from horizontal mode
-10003	float insertion, called from vertical mode.
-10004	float insertion.

Note: A float or marginpar puts the following sequence in the output list:

- (i) a penalty of -10004,
- (ii) a null `\vbox`
- (iii) a penalty of -10002 or -10003.

This solves two special problems:

1. If the float comes right after a `\newpage` or `\clearpage`, then the first penalty is ignored, but the second one invokes the output routine.
2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

THE OUTPUT ROUTINE

FUNCTIONS USED IN THE OUTPUT ROUTINE:

`\@outputpage` : Produces an output page with the contents of box `\@outputbox` as the text part.

Also sets `\@colht :=G \textheight`.

The page style is determined as follows.

IF `@thispagestyle = true`

THEN use `\thispagestyle` style

ELSE use ordinary page style.

`\@tryfcolumn\FLIST` : Tries to form a float column composed of floats from `\FLIST` (if nonempty) with the following parameters:

`\@colht` : height of box

`\@fpmin` : minimum height of floats in the box

`\@fpsep` : interfloat space

`\@fptop` : glue at top of box

`\@fpbot` : glue at bottom of box.

If it succeeds, then it does the following:

* `\@outputbox :=L` the composed float box.

* `@fcolmade :=G true`

* `\FLIST :=G \FLIST` - floats put in box

* `\@freelist :=G \@freelist +` floats put in box

If it fails, then:

* `@fcolmade :=G false`

NOTE: BIT MUST BE A SINGLE TOKEN!

`\@makefcolumn \FLIST` : Same as `\@tryfcolumn` except that it fails to make a float column only if `\FLIST` is empty. Otherwise, it makes a float column containing at least the first box in `\FLIST`, disregarding `\@fpmin`.

`\@startcolumn` :

Calls `\@tryfcolumn\@deferlist`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:

* Globally sets `\@toplist` and `\@botlist` to floats

from `\@deferlist` to go at top and bottom of column, deleting them from `\@deferlist`. It does this using `\@colht` as the total height, the page style parameters `\@floatsep` and `\@textfloatsep`, and the float placement parameters `\@topnum`, `\@toproom`, `\@botnum`, `\@botroom`, `\@colnum` and `\textfraction`.

- * Globally sets `\@colroom` to `\@colht` minus the height of the added floats.

`\@startdblcolum` :

Calls `\@tryfcolum\@dbldeferlist{8}`. If `\@tryfcolum` returns with (globally set) `@fcolmade = false`, then:

- * Globally sets `\@dbltoplist` to floats from `\@dbldeferlist` to go at top and bottom of column, deleting them from `\@dbldeferlist`. It does this using `\textheight` as the total height, and the parameters `\@dblfloatsep`, etc.
- * Globally sets `\@colht` to `\textheight` minus the height of the added floats.

`\@combinefloats` : Combines the text from box

`\@outputbox` with the floats from `\@toplist` and `\@botlist`, putting the new box in `\@outputbox`. It uses `\floatsep` and `\textfloatsep` for the appropriate separations. It puts the elements of `\@TOPLIST` and `\@BOTLIST` onto `\@freelist`, and makes those lists null.

`\@makecol` : Makes the contents of `\box255` plus the accumulated footnotes, plus the floats in `\@toplist` and `\@botlist`, into a single column of height `\@colht` (unless the page height has been locally changed), which it puts into box `\@outputbox`. It puts boxes in `\@midlist` back onto `\@freelist` and restores `\maxdepth`.

`\@opcol` : Outputs a column whose text is in box `\@outputbox`

If `@twocolumn = false`, then it calls `\@outputpage`, sets `\@colht :=G \textheight`, and calls `\@floatplacement`.

If `@twocolumn = true`, then:

If `@firstcolumn = true`, then it puts box `\@outputbox` into `\@leftcolumn` and sets `@firstcolumn :=G false`.

If `@firstcolumn = false`, then it puts out the current two-column page, any possible two-column float pages, and determines `\@dbltoplist` for the next page.

USER COMMANDS THAT CALL OR AFFECT THE OUTPUT ROUTINE

```

\newpage == BEGIN \par\vfil\penalty -10000 END

\clearpage == BEGIN \newpage
                \write -1{}      % Part of hack to make sure no
                \vbox{}          % \write's get lost.
                \penalty -10001
            END

\cleardoublepage == BEGIN \clearpage
                        if @twoside = true and c@page is even
                        then \hbox{} \newpage fi
            END

\twocolumn[BOX] : starts a new page, changing to twocolumn setting
                  and puts BOX in a parbox of width \textwidth across the top.
                  Useful for full-width titles for double-column pages.
                  SURPRISE: The stretch from \@dbltextfloatsep will be inserted
                           between the BOX and the top of the two columns.

```

FLOAT-HANDLING MECHANISMS

The float environment obtains an insertion number B from the `\@freelist` (see below for a description of list manipulation), puts the float into box B and sets `\count B` to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: `\vadjust{\penalty -10002}`
- In vmode : `\penalty -10003`.

For a double-column float, it puts B onto the `\@dbldeferlist`.

The float specifier has two components:

- * A PLACEMENT SPECIFICATION, describing where the float may be placed.
- * A TYPE, which is a power of two—e.g., figures might be type 1 floats, tables type 2 floats, programs type 4 floats, etc.

The float specifier is encoded as follows, where bit 0 is the least significant bit.

Bit	Meaning
0	1 iff the float may go where it appears in the text.
1	1 iff the float may go on the top of a page.
2	1 iff the float may go on the bottom of a page.
3	1 iff the float may go on a float page.
4	1 unless the PLACEMENT includes a !
5	1 iff a type 1 float

6 1 iff a type 2 float
etc.

A negative float specifier is used to indicate a marginal note.

MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

A FLOAT LIST consisting of the floats in boxes `\boxa ... \boxN` has the form:

```

\@elt \boxa ... \@elt \boxN
where \boxI is defined by
\newinsert\boxI

```

Normally, `\@elt` is `\let` to `\relax`. A test can be performed on the entire float list by locally `\def`'ing `\@elt` appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

```

\@next \CS \LIST {NONEMPTY}{EMPTY} == %% NOTE: ASSUME \@elt
= \relax
  BEGIN  assume that \LIST == \@elt \B1 ... \@elt \Bn
        if n = 0
        then  EMPTY
        else  \CS      :=L \B1
              \LIST :=G \@elt \B2 ... \@elt \Bn
              NONEMPTY
        fi
  END

```

`\@bitor\NUM\LIST` : Globally sets switch `@test` to the disjunction for all `I` of bit `log2 \NUM` of the float specifiers of all the floats in `\LIST`.
I.e., `@test` is set to true iff there is at least one float in `\LIST` having bit `log2 \NUM` of its float specifier equal to 1.

Note: `log2 [(\count I)/32]` is the bit number corresponding to the type of float `I`. To see if there is any float in `\LIST` having the same type as float `I`, you run `\@bitor` with
`\NUM = [(\count I)/32] * 32`.

```

\@bitor\NUM\LIST ==
  BEGIN
    @test :=G false
    { \@elt \CTR ==  if \NUM <> 0 then
                      if \count\CTR / \NUM is odd
                      then  @test := true          fi fi

```

```

\LIST
}
END

```

`\@cons\LIST\NUM` : Globally sets `\LIST := \LIST * \@elt \NUM`

```

\@cons\LIST\NUM ==
  BEGIN { \@elt == \relax
    \LIST :=G \LIST \@elt \NUM
  }

```

BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS

```

\@freelist      : List of empty boxes for placing new floats.
\@toplist       : List of floats to go at top of current column.
\@midlist       : List of floats in middle of current column.
\@botlist       : List of floats to go at bottom of current column.
\@deferlist     : List of floats to go after current column.
\@dbltoplist    : List of double-col. floats to go at top of current
                  page.
\@dbldeferlist  : List of double-column floats to go on subsequent
                  pages.

```

FLOAT-PLACEMENT ALGORITHMS

```

\@addtobot : Tries to put insert \@currbox on \@botlist.
             Called only when:
               * \ht BOX < \@colroom
               * type of \@currbox not on \@deferlist
               * \@colnum > 0
               * @insert = false
             If it succeeds, then:
               * sets @insert true
               * decrements \@botroom by \ht BOX
               * decrements \@botnum and \@colnum by 1
               * decrements \@colroom by \ht BOX + either \floatsep
                 or \textfloatsep, as appropriate.
               * sets \maxdepth to 0pt

\@addtotoporbot : Tries to put insert \@currbox on \@toplist or
                  \@botlist.
                  Called only under same conditions as \@addtobot.
                  If it succeeds, then:
                    * sets @insert true
                    * decrements \@toproom or \@botroom by \ht BOX
                    * decrements \@colnum and either \@topnum or
                      \@botnum by 1
                    * decrements \@colroom by \ht BOX + \floatsep

```

or `\textfloatsep`, as appropriate.

`\@addtocurcol` : Tries to add `\@currbox` to current column, setting
`@insert` true if it succeeds, false otherwise.
It will add `\@currbox` to top only if bit 0 of
`\count \@currbox` is 0, and to the bottom only if
bit 0 = 0 or an earlier float of the same type is
put on the bottom.
If the float is put in the text, then
`\penalty\interlinepenalty` is put
right after the float, before the following `\vskip`,
and `\outputpenalty :=L 0`.

`\@addtonextcol` : Tries to add `\@currbox` to the next column, setting
`@insert` true if it succeeds, false otherwise.

`\@addtodblcol` : Tries to add `\@currbox` to the next double-column page,
adding it to `\@dbltoplist` if it succeeds and
`\@dbldeferlist` if it fails.

```
\@addmarginpar ==
BEGIN
  if \@currlist nonempty
    then remove \@marbox from \@currlist
      add \@marbox and \@currbox to \@freelist
      %% NOTE: \@currbox = left box
    else LaTeX error: ? %% shouldn't happen
  fi
  \@tempcnta := 1      %% 1 = right, -1 = left
  if @twocolumn = true
    then if @firstcolumn = true
      then \@tempcnta := -1
    fi
    else if @mparswitch = true
      then if count0 odd
        else \@tempcnta := -1
      fi
    fi
    if @reversemargin = true
      then \@tempcnta := -\@tempcnta
    fi
  fi
  if \@tempcnta < 0 then \box\@marbox :=G \box\@currbox
  fi
  \@tempdima :=L maximum(\@mparbottom - \@pageht
                        + ht of \@marbox, 0)
  if \@tempdima > 0 then LaTeX warning: 'marginpar moved' fi
  \@mparbottom :=G \@pageht + \@tempdima + depth of \@marbox
                + \marginparpush
```

```

\@tempdima :=L \@tempdima - ht of \@marbox
\box\@marbox :=G \box\@currbox
\hbox{ \vbox { \vskip \@tempdima
\box\@marbox
}
height of \@marbox :=G depth of \@marbox :=G 0
\kern -\@pagedp
\nointerlineskip
\hbox{ if @tempcnta > 0 then \hskip \columnwidth
\hskip \marginparsep
else \hskip -\marginparsep
\hskip -\marginparwidth
fi
\box\@marbox \hss
}
\nobreak
\nointerlineskip
\hbox{\vrule height 0 width 0 depth \@pagedp}
END

```

Floats and marginpars add a lot of dead cycles.
End of historical L^AT_EX 2.09 comments.

65 \gdef\@botlist{}
66 \gdef\@midlist{}
67 \gdef\@currlist{}
68 \gdef\@deferlist{}
69 \gdef\@dbltoplist{}

The new algorithm stores page wide floats together with column floats in a single
\@deferlist list. We keep \@dbldeferlist initialised as empty so that packages that
are testing for deferred floats can use the same code for old or new float handling.
70 \gdef\@dbldeferlist{}

```

\AtBeginDvi We use a box register in which to put stuff that must appear before anything else in the .dvi file.

The stuff in the box should not add any typeset material to the page when it is unboxed.

This interface is no longer used. Instead a new one is inside `ltshipout.dtx`. We only keep the box in case some old code refers to it directly (or we do some rollback).

```

86 \newbox\@begindvibox
87 %\DeclareRobustCommand \AtBeginDvi [1]{%
88 % \global \setbox \@begindvibox
89 % \vbox{\unvbox \@begindvibox #1}%
90 %}

```

(End definition for \AtBeginDvi and \@begindvibox. These functions are documented on page 787.)

\@maxdepth This is not the right place to set this; it needs to be set in a class/style file when `\maxdepth` is set.

Also, many settings to `\maxdepth` should be to `\@maxdepth`, probably?

```

91 \newdimen\@maxdepth
92 \@maxdepth = \maxdepth

```

(End definition for \@maxdepth.)

\paperheight New `\paper...` registers.

```

93 \newdimen\paperheight
94 \newdimen\paperwidth

```

(End definition for \paperheight and \paperwidth.)

\if@insert Local switches first:

```

95 \newif \if@insert

```

\if@specialpage These should definitely be global:

```

96 \newif \if@fcolmade
97 \newif \if@specialpage \@specialpagefalse

```

\if@twocolumn These should be global but are not always set globally in other files.

```

98 \newif \if@firstcolumn \@firstcolumntrue
99 \newif \if@twocolumn \@twocolumnfalse

```

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be ‘preamble only’ commands)? Are these three such things?

```

165   \if@nobreak \@nobreakfalse \everypar{}\fi
166   \par
```

The `\vfil` at the end of the macro before the break penalty will normally result in the page being run short, even with `\flushbottom` in effect (in contrast to the behavior of `\pagebreak`). However, if there is some explicit stretch on the page, say, a `\vfill`, it has the undesired side-effect, that the last line will not align at its baseline if it contains characters going below the baseline, as the value of `\prevdepth` is no longer taken into account by $\mathrm{T}_{\mathrm{E}}\mathrm{X}$. So we back up by that amount (or by `\maxdepth` if it is really huge), to mimic the normal behavior without the `\newpage`.

```
167   \ifdim\prevdepth>\z@
168     \vskip -%
169     \ifdim\prevdepth>\maxdepth

234     \@latexerr{Float(s) lost}\@ehb
235     \let \@dbltoplist \@empty
236   \fi
237   \@cons \@dbltoplist \@currbox

```

This setting of `\@dbltopnum` is used only to change the typesetting in `\@combinedblfloats`.

```

238   \global \@dbltopnum \m@ne
239   \if@trace
240     \fl@trace{dbltopnum set to -1 (= \the \@dbltopnum) (topnewpage)}%
241   \fi

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by `\output`, in which case an extra, misleading, warning will be generated, OK? (This happens only when there is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra `\@emptycol` will be invoked in the second column by the conditional code guarded by the `\if@firstcolumn` test.

I now think that the cut-off point here should be `3\baselineskip`, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the ‘top-box’, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```

242 \ifdim \@colht<2.5\baselineskip
243   \@latex@warning@no@line {Optional argument of \noexpand\twocolumn
244     too tall on page \thepage}%
245   \@emptycol
246   \if@firstcolumn
247   \else
248     \@emptycol
249   \fi
250 \else
251   \global \vsize \@colht
252   \global \@colroom \@colht
253   \@floatplacement
254 \fi
255 }
```

(End definition for \twocolumn and \@topnewpage.)

`\output` This needs some small adjustments. We cannot guarantee that the float mechanism will
`\@specialoutput` interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of `\par` to the output routine. This avoids problems when the output routine is called within a list where `\par` may be a no-op.

```

256 \output {%
257   \let \par \@@par
258   \ifnum \outputpenalty<-\@M
259     \@specialoutput
260   \else
261     \@makecol
262     \@opcol
```

Moved to `\@opcol: \@floatplacement`.

```

263   \@startcolumn
```

This loop could be replaced by an `\expandafter` tail recursion in `\@startcolumn`.

```

264   \@whilesw \if@fcolmade \fi
265   {%
266   < *trace>
267     \fl@trace{PAGE: float \if@twocolumn column \else page \fi
268       completed}%
269   < /trace>
270   \@opcol\@startcolumn}%
271   \fi
272   \ifnum \outputpenalty>-\@Miv
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the vsize and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of `\@colroom`.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the `\output` itself; in the second column there will still not be enough room left so `\@emptycol` will be executed again when the OR is called by the page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within `\output` may not get executed with the correct value of `\if@firstcolumn`.

```

273   \ifdim \@colroom<1.5\baselineskip
274     \ifdim \@colroom<\textheight
275       \@latex@warning@no@line {Text page \thepage\space
276                               contains only floats}%
277       \@emptycol
278   %       \if@twocolumn
279   %       \if@firstcolumn
280   %       \else
281   %       \@emptycol
282   %       \fi
283   %       \fi

291     \global \vsize \maxdimen
292   \fi
293 }

```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

CHANGES TO `\@specialoutput`:

* `\penalty\z@` changed to `\penalty\interlinepenalty` so `\samepage` works properly with figure and table environments.

(Changed 23 Oct 86)

* Definition of `\@specialoutput` changed 26 Feb 88 so `\@pageht` and `\@pagedp` aren't changed for a marginal note.

(Change suggested by Chris Rowley.)

End of historical L^AT_EX 2.09 comments.

```

294 \gdef\@specialoutput{%
295   \ifnum \outputpenalty>-\@Mii
296     \@doclearpage

```

```

297 \else
298 \ifnum \outputpenalty<-\@Miii
299 \ifnum \outputpenalty<-\@MM \deadcycles \z@ \fi
300 \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
301 \else

```

Note that `\boxmaxdepth` should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen when the first penalty in the mechanism is discarded and therefore `\@holdpg` should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: `\setbox\@tempboxa \box \@cclv`.

The last box which is removed is the box put there by the double-penalty mechanism. The `\unskip` then removes the `\topskip` which is put there since the box is the first on the page.

```

302 \global \setbox\@holdpg \vbox{%
303 \unvbox\@holdpg
304 \unvbox\@cclv

```

We must now remove the box added by the float mechanism and the `\topskip` glue therefore added above it by T_EX.

```

305 \setbox\@tempboxa \lastbox
306 \unskip
307 }%

```

These two are needed as separate dimensions only by `\@addmarginpar`; for other purposes we put the whole size into `\@pageht` (see below).

```

308 \@pagedp \dp\@holdpg
309 \@pageht \ht\@holdpg
310 \unvbox \@holdpg
311 \@next\@currbox\@currlist{%
312 \ifnum \count\@currbox>\z@

```

Putting the whole size into `\@pageht` (see above).

```

313 \advance \@pageht \@pagedp
314 \ifvoid\footins \else
315 \advance \@pageht \ht\footins
316 \advance \@pageht \skip\footins
317 \advance \@pageht \dp\footins
318 \fi
319 \ifvbox \@kludgeins

```

We want to make the adjustment due to this insert only if the non-star form is used. The *-form will probably not work with floats, but maybe it still could make some adjustment here even so?

```

320 \ifdim \wd\@kludgeins=\z@
321 \advance \@pageht \ht\@kludgeins
322 (*trace)
323 \fl@trace {Extra size added: \the \ht\@kludgeins}%
324 (/trace)
325 \fi
326 \fi

```

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```

327         \@reinserts
328         \@addtocurcol
329     \else
330         \@reinserts
331         \@addmarginpar
332     \fi
333 } \@latexbug

```

A 2e change: use `\addpenalty` instead of `\penalty` here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the `nobreak` flag is true, a `\nobreak` must be correct.

```

334         \ifnum \outputpenalty<\z@
335             \if@nobreak
336                 \nobreak
337             \else
338                 \addpenalty \interlinepenalty
339             \fi
340         \fi
341     \fi
342 \fi
343 }
344 </2ekernel | fltrace>

```

(End definition for `\output` and `\@specialoutput`.)

`\@testwrongwidth` Test if the float box has the wrong width when trying to place it into some area. (Actually the test is for a conventional depth setting rather than for the width of the float. For that reason the box depth was explicitly tailored when the float was created).

`\f@depth`

```

369 <latexrelease>\let\f@depth\@undefined
370 <latexrelease>\EndIncludeInRelease

```

(End definition for \@testwrongwidth and \f@depth.)

\@docclearpage This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test \@testwrongwidth{<box>} at suitable places. That is at places where a box is taken off the deferlist.

```

371 <latexrelease>\IncludeInRelease{2015/01/01}{\@docclearpage}%

\@opcol Several changes in detail here.

```

465 <*2ekernel | fltrace>
466 \def \@opcol {%
467   \if@twocolumn
468     \@outputdblcol
469   \else
470     \@outputpage
471 <*trace>
472   \fl@trace{PAGE: one column (float? see above) page completed}%
473 </trace>

```

Not needed since it comes after \@outputpage:

```

474 %   \global\@colht\textheight
475   \fi

```

These do not need to be done every time \@opcol is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

```

476   \global \@mparbottom \z@ \global \@textfloatsheight \z@
477   \@floatplacement
478 }
479 </2ekernel | fltrace>

```

(End definition for \@opcol.)

\@makecol We must rewrite this macro to allow for variations in page-makeup required by changes in page-length.

This uses a different macro if a special-length column is being produced.

```

480 <*2ekernel>
481 \gdef \@makecol {%
482   \ifvoid\footins
483     \setbox\@outputbox \box\@cclv
484   \else
485     \setbox\@outputbox \vbox {%

```

This `\boxmaxdepth` setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use `\@maxdepth` otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```

486      \boxmaxdepth \@maxdepth

487 %      \@tempdima\dp\@cclv
488      \unvbox \@cclv
489 %      \vskip-\@tempdima
490      \vskip \skip\footins

491      \color@begingroup
492      \normalcolor
493      \footnoterule
494      \unvbox \footins
495      \color@endgroup
496    }%
497  \fi

```

The h floats have now been finally committed to this page so we can reset their list. The top and bottom floats are then added to the page.

```

498  \let\@elt\relax
499  \xdef\@freelist{\@freelist\@midlist}%

500  \global \let \@midlist \@empty
501  \@combinefloats

```

The variations start here in case `\enlargethispage` has been used.

```

502  \ifvbox\@kludgeins
503    \@makespecialcolbox
504  \else

```

This extra reboxing is only needed to add the `\@texttop` and `\@textbottom` but this could be done earlier, when the floats are added.

The `\boxmaxdepth` resetting here will have no effect unless `\@textbottom` ends with a box or rule. So is this (or possibly `\@maxdepth`) the correct value?

The `\vskip -\dimen@` ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If `\@textbottom` ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

I think that the final boxing of the main text page could have a common ending which may make it simpler to see what is going on.

This needs further investigation, especially in the ‘special case’.

Also, the `\boxmaxdepth` setting here affects what happens within `\@texttop` and `\@textbottom`, should it? Is it needed at all?

RmS 91/10/22: Replaced `\dimen128` by `\dimen@`.

```

505      \setbox\@outputbox \vbox to\@colht {%
506 %      \boxmaxdepth \maxdepth           %??
507      \@texttop
508      \dimen@ \dp\@outputbox
509      \unvbox \@outputbox

```

```

510     \vskip -\dimen@
511     \@textbottom
512   }%
513 \fi
514 \global \maxdepth \@maxdepth
515 }

```

(End definition for \makecol.)

\@reinserts This is the code which reinserts the inserts. It puts them all in one place; this can make some of them come out on the wrong page. It has been put into a separate macro to expedite experimentation.

```

516 \gdef \@reinserts{%
517   \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
518   \ifvbox\@kludgeins\insert\@kludgeins
519     {\unvbox\@kludgeins}\fi
520 }
521 </2ekernel>

```

(End definition for \@reinserts.)

\@makespecialcolbox This implements certain variations in page-makeup.

```

522 <*2ekernel | fltrace>
523 \gdef \@makespecialcolbox {%
524 <*trace>
525   \fl@trace{Kludgeins ht \the\ht\@kludgeins\space
526                                     dp \the\dp\@kludgeins\space
527                                     wd \the\wd\@kludgeins}%
528 </trace>

```

First we find the natural height of the column.

See above for discussion of what is happening here.

This needs further investigation, especially in this ‘special case’.

```

529 \setbox\@outputbox \vbox {%
530   \@texttop
531   \dimen@ \dp\@outputbox
532   \unvbox\@outputbox
533   \vskip-\dimen@
534 }%
535 \@tempdima \@colht
536 \ifdim \wd\@kludgeins>\z@

```

Note that in this case (the *-version), the height of the \@kludgeins box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size \@colht using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the T_EX level!).

This needs T_EX3 otherwise \pageshrink is zero anyway; it may not be exactly the figure we wish as it is the total available from the all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for both flush- and ragged-bottom setting since it makes the contents no smaller than the size (`\@colht`) of the box into which they are put.

Their should perhaps be an upper limit, of 0pt?, on the extra space added to force shrinking.

See above for a discussion of the `\boxmaxdepth` setting here.

```

537     \advance \@tempdima -\ht\@outputbox
538     \advance \@tempdima \pageshrink
539 <*trace>
540     \fl@trace {Natural ht of col: \the \ht\@outputbox}%
541     \fl@trace {\string \@colht: \the \@colht}%
542     \fl@trace {Pageshrink added: \the \pageshrink}%
543     \fl@trace {Hence, space added: \the \@tempdima}%
544 </trace>
545     \setbox\@outputbox \vbox to \@colht {%
546 %       \boxmaxdepth \maxdepth
547     \unvbox\@outputbox
548     \vskip \@tempdima
549     \@textbottom
550     }%
```

For the unstarred version, the final size of the page is precisely specified. Therefore, at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size `\@colht` with `\vss` at the bottom.

```

551     \else
552     \advance \@tempdima -\ht\@kludgeins
553 <*trace>
554     \fl@trace {Natural ht of col: \the \ht\@outputbox}%
555     \fl@trace {\string \@colht: \the \@colht}%
556     \fl@trace {Extra size added: -\the \ht \@kludgeins}%
557     \fl@trace {Hence, height of inner box: \the \@tempdima}%
558     \fl@trace {Max? pageshrink available: \the \pageshrink}%
559 </trace>
```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set `\boxmaxdepth` here since the `\@outputbox` ends with glue.

```

560     \setbox \@outputbox \vbox to \@colht {%
561     \vbox to \@tempdima {%
562     \unvbox\@outputbox
563     \@textbottom}%
564     \vss}%
565     \fi
```

Finally we need to explicitly make the insert box void.

```

566     {\setbox \@tempboxa \box \@kludgeins}%
567 <*trace>
568     \fl@trace {kludgeins box made void}%
569 </trace>
570 }
571 </2ekernel | fltrace>
```

(End definition for \@makespecialcolbox.)

```

\@texttop These do nothing as a default.
\@textbottom
572 <*2ekernel>
573 \let \@texttop \relax
574 \let \@textbottom \relax

```

(End definition for \@texttop and \@textbottom.)

\@resetactivechars RmS 93/09/06: added hook to protect against certain active characters in the output routine. Default checks are for active space and end-of-line.

```

575 \def\@activechar@info #1{%
576     \@latex@info@no@line {Active #1 character found while
577                             output routine is active
578                             \MessageBreak
579                             This may be a bug in a package file
580                             you are using}%
581 }

```

Do not put any spaces in this next bit!

```

582 \begingroup
583 \obeylines\obeyspaces%
584 \catcode'\'\active%
585 \gdef\@resetactivechars{%
586     \def~M{\@activechar@info{EOL}\space}%
587     \def {\@activechar@info{space}\space}%
588     \let'\active@math@prime}%
589 \endgroup

```

(End definition for \@resetactivechars and \@activechar@info.)

\@outputpage The \@color@hbox hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

There has been extensive tidying up of the old code here; including the removal of a level of grouping.

The setting of \protect immediately before the \shipout is needed so that protected commands within \writes are handled correctly.

Within shipout's vbox it is reset to its default value, \relax.

Resetting it to its default value after the shipout has been completed (and the contents of the writes have been expanded) must be done by use of \aftergroup. This is because it must have the value \relax before macros coming from other uses of \aftergroup within this box are expanded.

Putting this into the \aftergroup token list does not affect the definition used in expanding the \writes because the aftergroup token list is only constructed when popping the save-stack, it is not expanded until after the shipout is completed.

Question: should things from an \aftergroup within the shipped out box be executed in the environment set up for the writes, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```

590 </2ekernel>
591 <latexrelease>\IncludeInRelease{2017/04/15}%
592 <latexrelease> {\@outputpage}{Reset language for hyphenation}%
593 <*2ekernel | latexrelease>
594 \def\@outputpage{%

```

The `\endgroup` is put in by `\aftergroup`.

```
595 \begingroup
```

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the writes.

From here ... was in the command `\@writesetup`.

```
596 \let \protect \noexpand
```

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset `\language` to the value current at `\begin{document}`. In particular this ensures that a pagebreak in `verbatim` does not prevent hyphenation in the page head.

```
597 \language\document@default@language
```

The `\catcode'\ = 10` was removed as it was considered useless (presumably because nothing gets tokenized during shipout).

This was put in as some error produced active spaces in a mark, I think.

Why was the hyphen reset?

```
598 \@resetactivechars
```

If a page break happens between the start of a list and its first item the `@newlist` will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

```
599 \global\let\@@if@newlist\if@newlist
```

```
600 \global\@newlistfalse
```

This next hook replaces the following:

```
\let\-\@dischyph
```

```
\let'\@acci\let'\@accii\let\=\@acciii
```

```
\let\\@normalcr
```

```
\let\par\@par %% 15 Sep 87 (this was once inside the box)
```

and it does more than they did; in particular it sets:

```
\parindent\z@
```

```
\parskip\z@skip
```

```
\everypar{}
```

```
\leftskip\z@skip
```

```
\rightskip\z@skip
```

```
\parfillskip\@flushglue
```

```
\lineskip\normallineskip
```

```
\baselineskip\normalbaselineskip
```

```
\sloppy
```

```
601 \@parboxrestore
```

... to here was in the command `\@writesetup`.

```
602 \shipout \vbox{%
```

```
603 \set@typeset@protect
```

```
604 \aftergroup \endgroup
```

Correct? or just restore by ending the group?

```
605 \aftergroup \set@typeset@protect
```

This first bit has been moved inside the shipped out box.

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command \@shipoutsetup.

```
606 \if@specialpage
607 \global\@specialpagefalse\@nameuse{ps@\@specialstyle}%
608 \fi
609 \if@twoside

```

(End definition for \@outputpage, \@shipoutsetup, and \@writesetup.)

\@beginndvi This unboxes stuff that must appear before anything else in the .dvi file, then returns that box register to the free list and cancels itself.

The stuff in the box should not add any typeset material to the page.

```

710 \def \@beginndvi{%
711   \unvbox \@beginndvibox
712   \global\let \@beginndvi \@empty
713 }

```

(End definition for \@beginndvi.)

\@combinefloats The \boxmaxdepth setting here was not made local to a box so was dangerous. It is needed only within the box made by \@cflt (and not normally even there), so it has been moved there; this also agrees with the original pseudocode.

```

714 \def \@combinefloats {%
715   % \boxmaxdepth \maxdepth

```

If pdf links are present in the galley and those links get broken across pages they have to end up being on the same level of boxing (even if not actually in the same structure) due to some engine restrictions in pdf \TeX and Lua \TeX . We therefore unbox \@outputbox

here (which only contains a single `\hbox`) so that this case has the same boxing level as a normal twocolumn page without top floats.

```

770      \unvbox\@outputbox
771    }%
772  \fi
773 }
774 \endkernel

```

(End definition for `\@comfleft`, `\@comdblleft`, and `\@combinedblfloats`.)

`\@startcolumn` We could combine (most of) these two into `\@startcol <list>`. Note that `\@xstartcol` was only used once (i.e. in `\@startcolumn`); it has therefore been removed. This is not quite as efficient but it now has the same structure as `\@startdblcolumn`.

The empty-list test has been moved to `\@tryfcolumn`.

```

CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Since in 2e \samepage is no longer supported, these could be removed.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1148     \if@nobreak
1149     \nobreak
1150     \@nobreakfalse
1151     \everypar{}%
1152 \else

1812 \def\@addmarginpar{\@next\@marbox\@currlist{\@cons\@freelist\@marbox

```

```

1813 \cons\@freelist\@currbox}\@latexbug\@tempcnta\@ne
1814 \if@twocolumn
1815     \if@firstcolumn \@tempcnta\m@ne \fi
1816 \else
1817     \if@mparswitch
1818         \ifodd\c@page \else\@tempcnta\m@ne \fi
1819     \fi
1820     \if@reversemargin \@tempcnta -\@tempcnta \fi
1821 \fi
1822 \ifnum\@tempcnta <\z@ \global\setbox\@marbox\box\@currbox \fi
1823 \@tempdima\@mparbottom
1824 \advance\@tempdima -\@pageht
1825 \advance\@tempdima\ht\@marbox
1826 \ifdim\@tempdima >\z@
1827     \latex@warning@no@line {Marginpar on page \thepage\space moved}%
1828 \else
1829     \@tempdima\z@
1830 \fi
1831 \global\@mparbottom\@pageht
1832 \global\advance\@mparbottom\@tempdima
1833 \global\advance\@mparbottom\dp\@marbox
1834 \global\advance\@mparbottom\marginparpush
1835 \advance\@tempdima -\ht\@marbox

```

Putting box movement inside the ‘marbox’:

```

1836 \global\setbox \@marbox
1837         \vbox {\vskip \@tempdima
1838                 \box \@marbox}%
1839 \global \ht\@marbox \z@
1840 \global \dp\@marbox \z@

```

Sticking (rather than gluing:-) the ‘marbox’ to the line above, changed vskip to kern:

```

1841 \kern -\@pagedp
1842 \nointerlineskip
1843 \hb@xt@\columnwidth
1844     {\ifnum \@tempcnta >\z@
1845         \hskip\columnwidth \hskip\marginparsep
1846     \else
1847         \hskip -\marginparsep \hskip -\marginparwidth
1848     \fi
1849     \box\@marbox \hss}%

```

For this reason the following code can vanish:

```

\ nobreak           %% No longer needed.  CAR92/12
\ vskip -\@tempdima %% No longer needed.  CAR92/12

1850 \nointerlineskip
1851 \hbox{\vrule \@height\z@ \@width\z@ \@depth\@pagedp}}

```

(End definition for \@addmarginpar.)

1.1.1 Kludgeins

This part of the file is part of the implementation of the following two new commands for L^AT_EX2_ε.

`\enlargethispage{<dim>}`

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

`\enlargethispage*{<dim>}`

Similar to `\enlargethispage` but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with `\pagebreak`) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a `\clearpage`: please give keep them clear of such places.

`\@kludgeins` The insert which makes T_EX do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```
1852 \newinsert \@kludgeins
1853 \global\dimen\@kludgeins \maxdimen
1854 \global\count\@kludgeins 1000
```

(End definition for \@enlargepage.)

1.1.2 Float control

This part implements controllable floats and other changes to the float mechanism.

It provides, at the document level, the following command for inclusion in L^AT_EX2_ε.

`\suppressfloats`

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

[t] suppresses only floats at the top of the page [b] suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, !, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the following are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```

\fl@trace Set-up tracing for floats independent of other tracing as it produces mega-output. Default
\tracefloatsoff is no tracing.

1985 }

```

(End definition for `\suppressfloats` and `\flstop`.)

Manipulation of float placement and type; both their strings and the corresponding count registers.

`\@fpstype` First a new count register to go with `\@currtype`.
`\@reqcolroom` Then a new skip register, for information needed to remove the `\@maxsep` conservatism: it is possible that this could use a temporary register.
`\@textfloatsheight` Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of `\@addtocurcol` which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```
1986 \newcount \@fpstype
1987 \newdimen \@reqcolroom
1988 \newdimen \@textfloatsheight
1989 \endkernel
```

(End definition for `\@fpstype`, `\@reqcolroom`, and `\@textfloatsheight`.)

`\@fpsadddefault` Adds the default placement to what is already there.
Should not need to change this, but could do it as follows:

```
def \@fpsadddefault {%
  \@temptokena \expandafter\expandafter\expandafter
               {\csname fps@\@capytype \endcsname}%
  \edef \reserved@a {\the\@temptokena}%
  \@onelevel@sanitize \reserved@a
  \edef \@fps {\@fps\reserved@a}%

1990 \endkernel | fltrace)
1991 \def \@fpsadddefault {%

2067 </trace>
2068   \fi
2069 }

```

(End definition for \@resethfps.)

Special stuff for BANG floats.

`\@flsetnum` Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the ‘bang float’) with the changed value. This is the case within `\@addtocurcol` because it is used only once within a call of the output routine (which forms a group).

For `\@addtonextcol` this is achieved by putting a group around its code; this is needed because it is called (by `\@startcolumn`) for each float which was on the deferlist. Almost identical considerations pertain to `\@addtodblcol`. There may be more efficient ways to handle this, but the group seems to be the simplest.

```

2070 \def \@flsetnum #1{%
2071 <*trace>
2072   \fl@trace{fpstype: \the \@fpstype (flsetnum \string#1)}%
2073 </trace>
2074   \ifnum \@fpstype<\sxt@@n

```

```

2075     \ifnum #1=\z@
2076     <*trace>
2077         \fl@trace{BANG float resetting \string#1 to 1}%
2078     </trace>
2079         #1\@ne
2080     \fi
2081 \fi

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

1. The value `\textfraction` does not affect the processing of doublecol floats: this seems sensible, but should be documented.
2. `\twocolumn floatplacement` was wrong: `dbl` not needed, `ord` needed.

3. `\@floatplacement` was not called after `\@startdblcol` or `\@topnewpage`. This has been changed; it is clearly a bug fix.
4. The use `\@topnewpage` when `\dblfigrule` is non-trivial produced a rule in the wrong place. This has been fixed by not using `\dblfigrule` when processing the ‘float’ from `\@topnewpage`.
5. If the specifier was just `h` and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a ‘th’: this is only an error-recovery action, putting just `h` or `!h` should be deprecated.
6. `\@dblmaxsep` was ‘the maximum of `\dblfloatsep` and `\dbltextfloatsep`’. But it was never used! Now gone completely, like `\@maxsep`.
7. After an `h` float is put on a page, it was counted as text when applying the `\textfraction` test; this is possibly too big a change although it is a bug fix?
8. Two consecutive `h` floats are separated by twice `\intextsep`: this could be changed to one by use of `\addvspace`, OK? Note that it would also mean that less space is put in if an `h` float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
9. Now `\@addtocurcol` checks first for just `p` fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
10. `\@tryfcolumn` now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from `\@startcolumn`. As Frank pointed out, this makes `\@startcolumn` less efficient. But it is now the same as `\@startdblcolumn`: I can see no reason why they should be different, but which is best?
11. Why is `\@colroom` set in `\@doclearpage`?
12. Footnotes. Check what `\clearpage` does when footnotes are left over. Footnotes are not put on float pages and, also, `\@addtonextcol` ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
13. `\clearpage` can still lose non-boxes, at least when floats are involved. It also moves some to the ‘wrong page’, but this may be a coding problem.
14. The `!` option makes it necessary to check in `\output` that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set `\@textmin` too close to zero! A similar danger existed also if the text in a `\twocolumn[text]` entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than `\baselineskip`, with a warning: is this OK? Should it be made generic (another parameter)?
15. There are four possibilities for supporting this:
`\twocolumn[\maketitle more text]`
One is to change `\maketitle` slightly to allow this. Another is to change `\@topnewpage` so that more than one `\twocolumn[]` command is allowed; in this case `\maketitle\twocolumn[more text]` will work. The former is more robust

from the user's viewpoint, but makes the code for `\maketitle` rather ad hoc (maybe it is already?). Another is to misuse the global `twocolumn` flag locally within `\@topnewpage`. Yet another is to move the column count register from the `multicol` package into the kernel. This has been done.

16. Where should the reinserts be put to maximise the probability that footnotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?
17. Should we continue to support (as much as possible) `\samepage`? Some of its intended functionality is now advertised as being provided by `\enlargethispage`. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
18. Is the adjustment of space to cause shrinking in the kludge-* case correct? Should it be limited to 0pt?
19. Is the setting of `\boxmaxdepth` in `makecol` and friends needed? It only has any effect if `\@textbottom` ends with a box or rule, in which case the `vskip` to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.

It would perhaps be better to document that `\@textbottom` and `\@texttop` must have natural height 0pt.
20. I cannot see why the `vskip` adjustment for the depth is needed if `boxmaxdepth` is used to ensure that there is never a too deep box.
21. The value of `\boxmaxdepth` should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.

It is interesting to note that the value of `\boxmaxdepth` is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.
22. Should `\@maxdepth` store the setting of `\maxdepth` from `lplain`? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

`\@opcol` should do `\@floatplacement`, but where? Right at the end, since it always occurs at the start of a column.

```
\def\@opcol{%
% Why is this done first?
\global \@mparbottom \z@
\if@twocolumn
\@outputdblcol
\else
\@outputpage
% This is not needed since it is done at the end of
% |\@outputpage|:
\global \@colht \textheight
\fi}
```

Only tracing has been added to these.

```

2160 <latexrelease | fltrace>\IncludeInRelease{2017/01/01}%

2196 </2ekernel | fltrace | latexrelease>

```

This will line up the last baselines in the two columns provided they are constructed in the normal way: i.e. ending in a skip of minus the original depth, with `\@textbottom` adding nothing.

Thus again it is essential for `\@textbottom` to have depth 0pt.

```

2197 <latexrelease | fltrace>\IncludeInRelease{2015/01/01}%
2198 <latexrelease | fltrace> {\@outputdblcol}{2 column marks}%
2199 <*2ekernel | fltrace | latexrelease>

```

This is just a change to the single command `\@outputdblcol` so that it saves mark information for the first column and restores it in the second column.

```

2200 \def\@outputdblcol{%
2201   \if@firstcolumn
2202     \global\@firstcolumnfalse

```

Save the left column

```
2203 \global\setbox\@leftcolumn\copy\@outputbox
2204 \fl@trace{PAGE: first column boxed}%
```

Remember the marks from the first column

```
2205 \splitmaxdepth\maxdimen
2206 \vbadness\maxdimen
```

In case of `\enlargethispage` we will have infinite negative glue at the bottom of the page (coming from `\vss`) and that will earn us an error message if we `\vsplit` to get at the marks. So we need to remove the last glue (if any) at the end of `\@outputbox` as we are only interested in marks that change doesn't matter.

```
2207 \setbox\@outputbox\vbox{\unvbox\@outputbox\unskip}%
2208 \setbox\@outputbox\vsplit\@outputbox to\maxdimen
```

One minor difference from the current `fixmarks` package, pass the marks through a token register to stop any `#` tokens causing an error in a `\def`.

```
2209 \toks@\expandafter{\topmark}%
2210 \xdef\@firstcoltopmark{\the\toks@}%
2211 \toks@\expandafter{\splitfirstmark}%
2212 \xdef\@firstcolfirstmark{\the\toks@}%
```

This test does not work if truly empty marks have been inserted, but \LaTeX marks should always have (at least) two brace groups. (Except before the first mark is used, when the marks are empty, but that is OK here.)

```
2213 \ifx\@firstcolfirstmark\@empty

1.1.3 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

Limits for the placement of floating objects

\c@topnumber This counter holds the maximum number of floats that can appear at the top of a text page or column.

```

2288 <*2ekernel>
2289 \newcount\c@topnumber
2290 \setcounter{topnumber}{2}

(End definition for \c@topnumber.)

```

\topfraction This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.

```

2291 \newcommand\topfraction{.7}

(End definition for \topfraction.)

```

\c@bottomnumber This counter holds the maximum number of floats that can appear at the bottom of a text page or column.

```

2292 \newcount\c@bottomnumber
2293 \setcounter{bottomnumber}{1}

(End definition for \c@bottomnumber.)

```

\bottomfraction This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.

```

2294 \newcommand\bottomfraction{.3}

(End definition for \bottomfraction.)

```

\c@totalnumber This counter holds the maximum number of floats that can appear on any text page or column.

```

2295 \newcount\c@totalnumber
2296 \setcounter{totalnumber}{3}

(End definition for \c@totalnumber.)

```

\textfraction This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text.

```

2297 \newcommand\textfraction{.2}

(End definition for \textfraction.)

```

\floatpagefraction This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a ‘float page’ is produced.

```

2298 \newcommand\floatpagefraction{.5}

```

(End definition for `\floatpagefraction`.)

`\c@dbltopnumber` This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page.

2299 `\newcount\c@dbltopnumber`

2300 `\setcounter{dbltopnumber}{2}`

(End definition for `\c@dbltopnumber`.)

`\dbltopfraction` This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top.

2301 `\newcommand\dbltopfraction{.7}`

(End definition for `\dbltopfraction`.)

`\dblfloatpagefraction` This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a ‘double-column float page’ is produced.

2302 `\newcommand\dblfloatpagefraction{.5}`

(End definition for `\dblfloatpagefraction`.)

Floats on a text page

`\floatsep` When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

`\floatsep` is the space between adjacent floats that are placed at the top or bottom of the text page or column.

`\textfloatsep` is the space between the main text and floats at the top or bottom of the page or column.

`\intextsep` is the space between in-text floats and the text.

2303 `\newskip\floatsep`

2304 `\newskip\textfloatsep`

2305 `\newskip\intextsep`

2306 `\setlength\floatsep {12\p@ \@plus 2\p@ \@minus 2\p@}`

2307 `\setlength\textfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}`

2308 `\setlength\intextsep {12\p@ \@plus 2\p@ \@minus 2\p@}`

(End definition for `\floatsep`, `\textfloatsep`, and `\intextsep`.)

`\dblfloatsep` When double-column floats (floating objects that span the whole `\textwidth`) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by `\dblfloatsep` and `\dbltextfloatsep`. They are rubber lengths.

`\dblfloatsep` is the space between adjacent double-column floats placed at the top of the text page.

`\dbltextfloatsep` is the space between the main text and double-column floats at the top of the page.

2309 `\newskip\dblfloatsep`

2310 `\newskip\dbltextfloatsep`

2311 `\setlength\dblfloatsep {12\p@ \@plus 2\p@ \@minus 2\p@}`

2312 `\setlength\dbltextfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}`

(End definition for `\dblfloatsep` and `\dbltextfloatsep`.)

Floats on their own page or column

`\@fptop` When floating objects are placed on a separate page or column, called a ‘float page’, the layout of the page is controlled by these parameters, which are rubber lengths.

`\@fpsep` At the top of the page `\@fptop` is inserted; typically this supplies some stretchable whitespace. At the bottom of the page `\@fpbot` is inserted. Between adjacent floats `\@fpsep` is inserted.

These parameters are used for all floating objects on a ‘float page’ in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters `\@fptop` and `\@fpbot` should contain a `plus ...fil` so as to fill the remaining empty space.

```
2313 \newskip\@fptop
2314 \newskip\@fpsep
2315 \newskip\@fpbot
2316 \setlength\@fptop{0\p@ \@plus 1fil}
2317 \setlength\@fpsep{8\p@ \@plus 2fil}
2318 \setlength\@fpbot{0\p@ \@plus 1fil}
```

(End definition for \@fptop, \@fpsep, and \@fpbot.)

`\@dblftop` Double-column ‘float pages’ in two-column mode use similar parameters.

```
\@dblfpsep 2319 \newskip\@dblftop
\@dblfpbot 2320 \newskip\@dblfpsep
2321 \newskip\@dblfpbot
2322 \setlength\@dblftop{0\p@ \@plus 1fil}
2323 \setlength\@dblfpsep{8\p@ \@plus 2fil}
2324 \setlength\@dblfpbot{0\p@ \@plus 1fil}
```

(End definition for \@dblftop, \@dblfpsep, and \@dblfpbot.)

`\topfigrule` The macros can be used to put in rules between floats and text; whatever they insert should be vertical mode material which takes up zero space.

```
\botfigrule 2325 \let\topfigrule=\relax
\dblfigrule 2326 \let\botfigrule=\relax
2327 \let\dblfigrule=\relax
2328 \endkernel
```

(End definition for \topfigrule, \botfigrule, and \dblfigrule.)

File U

lthyphen.dtx

This file contains the code for loading hyphenation patterns into L^AT_EX. Most of this will end up in a file called `hyphen.ltx`. If you wish to customize your L^AT_EX system in respect of hyphenation patterns, write a file `hyphen.cfg`. If this file exists, it will be loaded instead of `hyphen.ltx`. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the DOCSTRIP program, or one can run this file directly through L^AT_EX 2_ε.

```
1 <*driver>
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 </driver>
```

The default file `hyphen.ltx` loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file `hyphen.cfg`. This is best done by starting from `hyphen.ltx`.

For backward compatibility, the default file, `hyphen.ltx`, first tries to load the file `hyphen.tex`. If this file exists, an information message is issued and the appropriate defaults for T_EX's internal parameters are set: `\language` is initialized to 0, and `\lefthyphenmin` and `\righthyphenmin` to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 <*default>
8 \InputIfFileExists{hyphen.tex}%
9   {\message{Loading hyphenation patterns for US english.}}%
10   \language=0
11   \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT_EX run is terminated by invoking `\@@end` (which is the L^AT_EX 2_ε name for T_EX's `\end` primitive).

```
12   {\errhelp{The configuration for hyphenation is incorrectly
13             installed.^^J%
14             If you don't understand this error message you need
15             to seek^^Jexpert advice.}%
16   \errmessage{OOPS! I can't find any hyphenation patterns for
17             US english.^^J \space Think of getting some or the
18             latex2e setup will never succeed}\@@end}
19 </default>
```

The following example describes the possible contents of a file `hyphen.cfg` that will load both US English and German hyphenation patterns, making the former the default. It sets `\language` to 0 for the US patterns and to 1 for the German patterns. Then `\language` is set to 0 to make this the default and the default values of `\lefthyphenmin` and `\righthyphenmin` are set.

```
language=0
input hyphen % (or \input ushyphen1 if the file has been renamed)
language=1
input ghyph31
```

```
language=0
lefthyphenmin=2
righthyphenmin=3
endinput
```

Another possibility is to use the package `babel`, by Johannes Braams. That package is distributed with a suitable `hyphen.cfg` file.

File V

ltxfinal.dtx

1 Final settings

This section contains the final settings for L^AT_EX. It initializes some debugging and typesetting parameters, sets the default `\catcodes` and `uc/lc` codes, and inputs the hyphenation file.

1.1 Debugging

By default, L^AT_EX shows statistics:

```
1 <*2ekernel>
2 \tracingstats1
```

1.2 Typesetting parameters

```
\@lowpenalty These are penalties used internally.
\@medpenalty 3 \newcount\@lowpenalty
\@highpenalty 4 \newcount\@medpenalty
5 \newcount\@highpenalty
```

(End definition for \@lowpenalty, \@medpenalty, and \@highpenalty.)

```
\newmarks Allocate extended marks types if etex is active. Placed here at the end of the format to
increase compatibility with count allocations in earlier releases.
```

```

80 <latexrelease>\EndIncludeInRelease
81 <*2ekernel>

```

(End definition for `\newXeTeXintercharclass`, `\xe@alloc@intercharclass`, and `\e@alloc@intercharclass@top`.)

The default values of the picture and `\fbox` parameters:

```

82 \unitlength = 1pt
83 \fboxsep = 3pt
84 \fboxrule = .4pt

```

The saved value of $\mathrm{T}_{\mathrm{E}}\mathrm{X}$'s `\maxdepth`:

```

85 \@maxdepth = \maxdepth

```

`\vsize` initialized because a `\clearpage` with `\vsize < \topskip` causes trouble. `\@colroom` and `\@colht` also initialized because `\vsize` may be set to them if a `\clearpage` is done before the `\begin{document}`

```

86 \vsize = 1000pt
87 \@colroom = \vsize
88 \@colht = \vsize

```

Initialise `\textheight` `\textwidth` and page style, to avoid internal errors if they are not set by the class.

```

89 \textheight=.5\maxdimen
90 \textwidth=\textheight
91 \ps@empty

```

1.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is engine-native working. The common loader system provides access to data from the Unicode Consortium covering not only `\lccode` but also other related data. The `\lccode` part of that at least needs to be loaded before hyphenation is tackled: $\mathrm{XeT}_{\mathrm{E}}\mathrm{X}$ follows the standard $\mathrm{T}_{\mathrm{E}}\mathrm{X}$ route of building patterns into the format. $\mathrm{LuaT}_{\mathrm{E}}\mathrm{X}$ doesn't require this data be loaded *here* but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide `\Umathcode`.

```

156 <*2ekernel>

```

There is one over-ride that makes sense here (see below for the same for 8-bit engines): setting the lcode for - to itself.

```
157 \lccode'\- ='\- % default hyphen char
```

The alternative is that a “traditional” engine is in use.

```
158 \else
```

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define \reserved@a to apply \reserved@c to all the numbers in the range of its arguments.

```
159 \def\reserved@a#1#2{%
160   \@tempcnta#1\relax
161   \@tempcntb#2\relax
162   \reserved@b
163 }
164 \def\reserved@b{%
165   \ifnum\@tempcnta>\@tempcntb\else
166     \reserved@c\@tempcnta
167     \advance\@tempcnta\@ne
168     \expandafter\reserved@b
169   \fi
170 }
```

Depending on the T_EX version, we might not be allowed to do this for non-ASCII characters.

```
171 \def\reserved@c#1{%
172   \count@=#1\advance\count@ by -"20
173   \uccode#1=\count@
174   \lccode#1=#1
175 }
176 \reserved@a{'\a}{'\z}
177 \reserved@a{"A0}{\BC}
178 \reserved@a{"E0}{\FF}
```

The upper case characters need their \uccode and \lccode values set, and their \sfcode set to 999.

```
179 \def\reserved@c#1{%
180   \count@=#1\advance\count@ by "20
181   \uccode#1=#1
182   \lccode#1=\count@
183   \sfcode#1=999
184 }
185 \reserved@a{'\A}{'\Z}
186 \reserved@a{"80}{\9C}
187 \reserved@a{"C0}{\DF}
```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lcode isn’t quite what you’d expect.

```
188 \uccode'\^^Y='I % dotless i
189 \lccode'\^^Y='^^Y % dotless i
190 \uccode'\^^Z='J % dotless j, ae in OT1
191 \lccode'\^^Z='^^Z % dotless j, ae in OT1
192 \lccode'\^^9d='i % dotted I
193 \uccode'\^^9d='^^9d % dotted I
194 \lccode'\^^9e='^^9e % d-bar
195 \uccode'\^^9e='^^d0 % d-bar
```

Finally here is one that helps hyphenation in the OT1 encoding.

```
196 \lccode'\^^[='^^[ % oe in OT1
```

And we also set the \lccode of \- and \textcompwordmark so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

```
197 \lccode'\- ='\' % default hyphen char
198 \lccode 127=127 % alternate hyphen char
199 \lccode 23 =23 % textcompwordmark in T1
```

End of the conditional to select either Unicode or T1 encoding defaults.

```
200 \fi
```

At this stage, we can install any last-minute expl3 set-up.

```
201 \@expl@finalise@setup@@
202 \def\@expl@finalise@setup@@{}
```

This is as good a place as any to active a few XeTeX-specific settings

```
203 \ifx\XeTeXuseglyphmetrics\undefined
204 \else
205   \XeTeXuseglyphmetrics=1 %
206   \XeTeXdashbreakstate=1 %
207 \fi
```

1.4 Hyphenation

The following code will be compiled into the format file. It checks for the existence of `hyphen.cfg` in inputs that file if found. Otherwise it inputs `hyphen.ltx`. Note that these are loaded in *before* the \catcodes are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

```
208 \InputIfFileExists{hyphen.cfg}
209   {\typeout{=====^^J%
210             Local configuration file hyphen.cfg used^^J%
211             =====}%
212   \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
213   }
214   {\input{hyphen.ltx}}
215 \let\@addtofilelist\@gobble
```

\l@nohyphenation

1.6 Input encoding

Starting with the 2018 L^AT_EX release default the inputencoding to UTF-8. Unless the format is being used with luatex, xetex, enc_{te}x or ml_{te}x.

This is done in a way largely compatible with older releases: `utf8.def` is input just as if

```
\usepackage[utf8]{inputenc}
```

had been used, however rather than input the whole package a minimal core part just enough to support loading the UTF-8 encoding files is defined here.

If a document re-specifies UTF-8 this is silently ignored.

```

279 </2ekernel>

465 \reserved@a{'\a }{'\z}

```

All the characters in the range 0–31 and 127–255 are illegal, *except* tab (\sim I), nl (\sim J), ff (\sim L) and cr (\sim M).

1.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their `\uccode` and `\lccode` values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the T_EX version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines (XeT_EX and LuaT_EX) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```

466 \ifnum 0%
467 \ifx\Umathcode\@undefined\else 1\fi
468 \ifx\XeTeXmathcode\@undefined\else 1\fi
469 >\z@
470 \else
471 \def\reserved@c#1{%
472   \count@=#1\advance\count@ by -"20
473   \uccode#1=\count@
474   \lccode#1=#1
475 }
476 \reserved@a{'\a }{'\z}
477 \reserved@a{"A0 }{"BC}
478 \reserved@a{"E0 }{"FF}

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcode` set to 999.

```

479 \def\reserved@c#1{%
480   \count@=#1\advance\count@ by "20
481   \uccode#1=#1
482   \lccode#1=\count@
483   \sfcode#1=999
484 }
485 \reserved@a{'\A}{'\Z}
486 \reserved@a{"80}{\9C}
487 \reserved@a{"C0}{\DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose `uccode` or `lccode` isn't quite what you'd expect.

```

488 \uccode'\^^Y='I % dotless i
489 \lccode'\^^Y='^^Y % dotless i
490 \uccode'\^^Z='J % dotless j, ae in OT1
491 \lccode'\^^Z='^^Z % dotless j, ae in OT1
492 \lccode'\^^9d='i % dotted I
493 \uccode'\^^9d='^^9d % dotted I
494 \lccode'\^^9e='^^9e % d-bar
495 \uccode'\^^9e='^^d0 % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

496 \lccode'\^^[='^^[ % oe in OT1
497 \fi % End of reset block for 8-bit engines

```

`\MakeUppercase` And whilst we're doing things with `uc/lc` tables, here are two commands to upper- and lower-case a string.

`\MakeUppercase`

`\@uclclist`

Note that this implementation is subject to change! At the moment we're not providing any way to extend the list of `uc/lc` commands, since finding a good interface is difficult. These commands have some nasty features, such as uppercasing mathematics, environment names, labels, etc. A much better long-term solution is to use all-caps fonts, but these aren't generally available.

```

498 \DeclareRobustCommand{\MakeUppercase}[1]{%
499   \def\i{I}\def\j{J}%
500   \def\reserved@a##1##2{\let##1##2\reserved@a}%
501   \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b\@gobble}%

```

Tell UTF-8 processing to process chars even though we are in an `\protected@edef`.

```

502   \let\UTF@two@octets@noexpand\@empty
503   \let\UTF@three@octets@noexpand\@empty
504   \let\UTF@four@octets@noexpand\@empty
505   \protected@edef\reserved@a{\uppercase{#1}}%
506   \reserved@a
507 }
508 \DeclareRobustCommand{\MakeLowercase}[1]{%
509   \def\reserved@a##1##2{\let##1##2\reserved@a}%
510   \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b\@gobble}%
511   \let\UTF@two@octets@noexpand\@empty
512   \let\UTF@three@octets@noexpand\@empty
513   \let\UTF@four@octets@noexpand\@empty
514   \protected@edef\reserved@a{\lowercase{#1}}%
515   \reserved@a
516 }

```

```

517 \def\@uclclist{\oe\OE\o\O\ae\AE
518 \dh\DH\dj\DJ\l\L\ng\NG\ss\SS\th\TH}

```

The above code works, but has the nasty side-effect that if you say something like:

```

\markboth{\MakeUppercase\contentsname}
{\MakeUppercase\contentsname}

```

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```

\mark{\protect\MakeUppercase Table of Contents}
{\protect\MakeUppercase Table of Contents}

```

In order to get round this, we redefine `\MakeUppercase` and `\MakeLowercase` to grab their argument and brace it. This is a very low-level hack, and is *not* recommended practice! This is an instance of a general problem that makes it unsafe to grab arguments unbraced, and probably needs a more general solution. For the moment though, this hack will do:

```

519 \protected@edef\MakeUppercase#1{\MakeUppercase{#1}}
520 \protected@edef\MakeLowercase#1{\MakeLowercase{#1}}

```

(End definition for `\MakeUppercase`, `\MakeLowercase`, and `\@uclclist`.)

1.8 Applying Patch files

Between major releases, small patches will be distributed in files `ltpatch.ltx` which must be added at this point.

Patch file code removed.

```

521 %\IfFileExists{ltpatch.ltx}
522 % {\typeout{=====^J%
523 %           Applying patch file ltpatch.ltx^J%
524 %           =====}}
525 % \def\fmtversion@topatch{unknown}
526 % \input{ltpatch.ltx}
527 % \ifx\fmtversion\fmtversion@topatch
528 % \ifx\patch@level\@undefined
529 % \typeout{^^J^^J^^J%
530 %         !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!^J%
531 %         !! Patch file 'ltpatch.ltx' not suitable for this^^J%
532 %         !! version of LaTeX.^^J^^J%
533 %         !! Please check if initex found an old patch file:^^J%
534 %         !! --- if so, rename it or delete it, and redo the^^J%
535 %         !! initex run.^^J%
536 %         !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!^J}%
537 % \batchmode \@@end
538 % \else

```

The code below adds the 'patch level' string to the first `\typeout` in the startup banner.

```

539 % \def\fmtversion@topatch{0}%
540 % \ifx\fmtversion@topatch\patch@level\else
541 % \def\reserved@a\typeout##1##2\reserved@a{%
542 % \typeout{##1 patch level \patch@level}##2}
543 % \everyjob\expandafter\expandafter\expandafter{%
544 % \expandafter\reserved@a\the\everyjob\reserved@a}

```

(End definition for \@providesfile.)

`\@filelist` Reset `\@filelist` so files input while making the format are not listed. The list built up
`\@addtofilelist` so far may take up a lot of memory and so it is moved to `\reserved@a` where it will be
overwritten as soon as almost any L^AT_EX command is issued in a class file. However the
`latexbug.tex` program will be able to access this information and insert it into a bug
report.

```
578 \let\@filelist\@gobble
579 \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}%
```

(End definition for \@filelist and \@addtofilelist.)

1.11 Do some temporary work for pre-release

This is a good place to load code that hasn't yet been integrated into the other files ...

1.12 Some last minute initializations ...

Load the first aid set of definitions for external packages that await updates.

```
580 \@input{latex2e-first-aid-for-external-files.ltx}
581 \@input{ltpara.ltx}
```

1.13 Dumping the format

Finally we make `@` into a letter, ensure the format will be in the 'normal' error mode, and dump everything into the format file.

```
582 \makeatother
583 \errorstopmode
584 \dump
585 </2ekernel>
```

Change History

1985-11-04 ltmath.dtx LaTeX2.09		<code>\mathversion</code> : Test if version defined added.	347
General: produce warning message if line extends into margin. Doesn't warn about formula overprinting equation number.	567		
1989-04-10 ltfssbas.dtx v1.0a		1989-04-29 ltfssbas.dtx v1.0i	
General: Starting with version numbers! <code>\ifmmode</code> added in <code>\math@group</code>	336	General: Removed the <code>\halign</code> <code>\noalign</code> correction (wasn't bugfree)	336
1989-04-10 ltfssbas.dtx v1.0b		1989-04-29 ltfssini.dtx v1.0f	
General: <code>\preload@sizes</code> added.	336	General: Corrections to L ^A T _E X tabular env. added.	441
<code>\wrong@fontshape</code> changed to define substitution font/shape macro.	336	1989-05-01 ltfssbas.dtx v1.0j	
1989-04-10 ltfssini.dtx v1.0a		General: Default for <code>\baselinestretch</code> added.	336
General: Starting with version numbers <code>\newif</code> for <code>\@tempswa</code> added since this switch is unknown at the time when this file is read in. (latex.tex is loaded later.) <code>\math@famname</code> changed to <code>\math@version</code>	441	1989-05-22 ltfssbas.dtx v1.0k	
1989-04-14 ltfssbas.dtx v1.0c		General: Lines longer than 72 characters folded.	336
General: More documentation added.	336	1989-05-22 ltfssini.dtx v1.0g	
1989-04-15 ltfssini.dtx v1.0b		General: Lines shortened to 72 characters	441
General: <code>\mathfontset</code> renamed to <code>\mathversion</code>	441	1989-09-14 ltfssbas.dtx v1.0m	
1989-04-19 ltfssbas.dtx v1.0d		General: Global replacement: <code>\group</code> to <code>\mathgroup</code>	336
General: Even more doc.	336	<code>\mathversion</code> : Corrected typo: <code>\endscname</code> to <code>\endcsname</code>	347
1989-04-21 ltfssbas.dtx v1.0e		1989-11-07 ltfssini.dtx v1.0i	
General: Documentation is fun! Parameters of <code>\define@mathalphabet</code> changed.	336	General: All family, series, and shape names abbreviated.	441
1989-04-21 ltfssini.dtx v1.0c		1989-11-08 ltfssbas.dtx v1.0o	
General: Changed to conform to fam.tex.	441	General: First parameter of <code>\define@mathalphabet</code> and <code>\define@mathgroup</code> changed from string to control sequence.	336
1989-04-23 ltfssbas.dtx v1.0f		1989-11-14 ltfssbas.dtx v1.0p	
General: % in <code>\getanddefinefonts</code> added.	336	<code>\math@version</code> : Math version prefix 'mv@' added.	347
1989-04-26 ltfssini.dtx v1.0d		1989-11-19 ltfssbas.dtx v1.0q	
General: <code>\xpt</code> added.	441	<code>\define@newfont</code> : Group added.	349
1989-04-27 ltfssbas.dtx v1.0g		<code>\wrong@fontshape</code> : Instead of calling <code>\family\default@family</code> , etc. we directly set <code>\f@family</code> , etc.	353
General: Documentation revised.	336	1989-11-22 ltfssbas.dtx v1.0r	
1989-04-27 ltfssini.dtx v1.0e		<code>\math@version</code> : <code>\def</code> → <code>\edef</code> for <code>\math@version</code>	347
General: Definitions of L ^A T _E X symbols corrected.	441	1989-11-25 ltfssbas.dtx v1.0s	
1989-04-29 ltfssbas.dtx v1.0h		General: All <code>\edef\font@name</code> changed to <code>\xdef\font@name</code> . Necessary after introduction of <code>\begingroup/\endgroup</code> in v1.0q.	336
General: Documented problem with <code>\halign</code> , and <code>\noalign</code>	336	extra// → + in <code>\extra@def</code>	336

1989-11-26 ltfssbas.dtx v1.0t	1990-01-25 ltfssini.dtx v1.1e
<code>\select@group</code> : <code>\bgroup</code> / <code>\egroup</code>	<code>\nfss@text</code> : Macro added. 460
changed to	1990-01-27 ltfssbas.dtx v1.2d
<code>\begingroup</code> / <code>\endgroup</code> to avoid	<code>\DeclarePreloadSizes</code> : Font identifier
empty Ord atom on math list. . . 356	set to <code>\relax</code> 342
1989-12-02 ltfssini.dtx v1.1b	1990-01-28 ltfssbas.dtx v1.2e
General: <code>\rmmath</code> renamed to	<code>\mathgroup</code> : <code>\newfam</code> let to
<code>\mathrm</code> 441	<code>\new@mathgroup</code> 336
1989-12-03 ltfssini.dtx v1.1c	1990-01-28 ltfssbas.dtx v1.2f
General: Some internal macros	<code>\define@newfont</code> : Added call to
renamed to make them	<code>\curr@fontshape</code> macro to allow
inaccessible. 441	substitution. 349
1989-12-05 ltfssbas.dtx v1.10u	<code>\wrong@fontshape</code> : Warning message
<code>\addto@hook</code> : <code>\addto@hook</code> added. . 361	slightly changed. 353
1989-12-05 ltfssstrc.dtx v1.0u fam.dtx	1990-01-28 ltfssini.dtx v1.2b
<code>\every@math@size</code> : Hook <code>\every@size</code>	<code>\em</code> : Call to <code>\@nomath</code> added. 458
added. 393	1990-02-08 ltfssini.dtx v1.1g
1989-12-13 ltfssstrc.dtx v1.0f	General: Protected the commands
<code>\use@mathgroup</code> : <code>\expandafter</code> added	<code>\family</code> , <code>\series</code> , <code>\shape</code> , <code>\size</code> ,
before final <code>\fi</code> 396	<code>\selectfont</code> , and <code>\mathversion</code> . 441
1989-12-16 ltfssbas.dtx v1.1a	1990-02-16 ltfssbas.dtx v1.2g
<code>\select@group</code> : <code>\relax</code> in front	General: Support for changes of
added. 356	<code>\baselineskip</code> without changing
Now four arguments. 356	the size. 336
Redefinition of alphabet now	<code>\math@version</code> : <code>\@nomath</code> added. . . 347
simpler. 356	1990-02-18 ltfssstrc.dtx v1.0j
Usage of ‘=’ macro added. 356	<code>\selectfont</code> : Redefine unprotected
1989-12-16 ltfssstrc.dtx v1.1a	version <code>\p@selectfont</code> instead of
<code>\selectfont</code> : Changed order of calls. 388	<code>\selectfont</code> 388
<code>\use@mathgroup</code> : Redefinition of	1990-03-14 ltfssstrc.dtx v1.0k
alphabet now simpler. 395	General: Added code for TeX3. 384
Usage of ‘=’ macro added. 395	<code>\extract@font</code> : Added code for
1990-01-18 ltfssstrc.dtx v1.0h	TeX3. 387
General: <code>\tracingfonts</code> meaning	1990-03-30 ltfssbas.dtx v1.2h
changed. 384	<code>\math@egroup</code> : Changed to have one
1990-01-20 ltfssbas.dtx v1.2a	arg. 358
<code>\math@bgroup</code> : Def. placed in this	1990-03-30 ltfssstrc.dtx v1.2h
file. 358	<code>\use@mathgroup</code> : Third argument
<code>\math@egroup</code> : Def. placed in this	removed (see <code>\math@egroup</code>). . . . 395
file. 358	1990-04-01 ltfssbas.dtx v1.2i
<code>\select@group</code> : Def for alph id	General: Code added from
changed. 356	tracefnt.dtx. 336
1990-01-21 ltfssbas.dtx v1.2b	Support for TeX3. 336
<code>\select@group</code> : Code moved to	1990-04-01 ltfssstrc.dtx v1.0l
<code>\use@mathgroup</code> 356	General: Part of code moved to
1990-01-21 ltfssstrc.dtx v1.2b	fam.dtx. 384
<code>\use@mathgroup</code> : Macro added to	<code>\tracingfonts</code> : Check if
allow cleaner interface. 395	<code>\tracingfonts</code> already defined. . 385
1990-01-23 ltfssbas.dtx v1.2c	1990-04-01 ltfssstrc.dtx v1.0o
General: <code>\no@version@warning</code>	<code>\tracingfonts</code> : Check if
renamed to <code>\no@alphabet@error</code> . 336	<code>\tracingfonts</code> defined removed
Macro <code>\no@alphabet@help</code> added 336	again. 385
<code>\no@alphabet@error</code> : Changed to	
error call 336	

1990-04-02 ltfsini.dtx v1.1i	1991-08-14 ltpictur.dtx LaTeX2.09
General: <code>\input</code> of files now handled	General: (RmS) inserted extra braces
by docstrip. 441	around entry for NFSS 635
1990-04-05 ltfsstrc.dtx v1.0m	1991-08-14 ltthm.dtx LaTeX2.09
<code>\selectfont</code> : Call <code>\tracingon</code> only if	<code>\endtheorem</code> : Moved <code>\itshape</code> after
<code>\tracingfonts</code> greater than 3. . . 388	<code>\item</code> to make it work with NFSS 665
1990-05-05 ltfsstrc.dtx v1.0n	1991-08-26 ltfsini.dtx v1.1n
<code>\selectfont</code> : <code>\tracingon</code> with new	<code>\reset@font</code> : Macro introduced . . . 461
syntax. 388	1991-08-26 ltmiscen.dtx LaTeX2.09
1990-06-23 ltfsini.dtx v1.1k	<code>\verbatim</code> : <code>\@par</code> added 552
<code>\nfss@text</code> : Changed to <code>\mbox</code> 461	1991-08-26 ltpictur.dtx LaTeX2.09
1990-06-24 ltfsbas.dtx v1.2j	<code>\endpicture</code> : (RmS & FMi) extra
<code>\DeclarePreloadSizes</code> : Missing	boxing level around <code>\@picbox</code> to
percent added. 342	guard against unboxing in math
1990-06-24 ltfsstrc.dtx v1.0o	mode (proposed by John Hobby) 633
<code>\baselinestretch</code> : Moved to	1991-08-26 ltplain.dtx LaTeX2.09
tracefnt.dtx. 393	<code>\tracingall</code> : Added
<code>\getanddefine@fonts</code> : <code>\Adding</code>	<code>\errorcontextlines=\maxdimen</code> ,
tracing code. 396	suggested by J. Schrod 31
<code>\Macro</code> moved from fam.dtx. . . . 396	1991-09-29 ltboxes.dtx LaTeX2.09
Adding debug code. 396	<code>\mpfootnotetext</code> : (RmS) added
<code>\use@mathgroup</code> : Tracing code added. 395	<code>\reset@font</code> 601
1990-06-30 ltfsbas.dtx v1.2l	1991-09-29 ltfloat.dtx LaTeX2.09
<code>\showhyphens</code> : Macro added. 359	<code>\@footnotetext</code> : (RmS) added
1990-06-30 ltfsstrc.dtx v1.0p	<code>\reset@font</code> 698
<code>\use@mathgroup</code> : Added <code>\relax</code> after	1991-09-29 ltmath.dtx LaTeX2.09
math group number. 396	<code>\eqnnum</code> : RmS: <code>\reset@font</code> added. 567
1990-07-07 ltfsstrc.dtx v1.0q	1991-09-29 ltsect.dtx LaTeX2.09
<code>\getanddefine@fonts</code> : Group number	<code>\dottedtocline</code> : (RmS) added
added to tracing. 396	<code>\reset@font</code> for page number . . 677
<code>\math@egroup</code> : Tracing code added. 396	1991-10-17 ltctrl.dtx LaTeX2.09
<code>\use@mathgroup</code> : Group number	<code>\tfor</code> : (RmS) <code>\xdef</code> replaced by <code>\def</code>
added to tracing. 395	(See FMi's array.doc) 227
1990-08-27 ltfsstrc.dtx 1.0r	1991-10-25 ltbibl.dtx LaTeX2.09
<code>\type@restoreinfo</code> : Some extra	<code>\citex</code> : added <code>\reset@font</code> ,
tracing info. 391	suggested by Bernd Raichle. . . . 706
1990-08-27 ltfsstrc.dtx v1.0r	1991-11-01 ltfloat.dtx LaTeX2.09
<code>\getanddefine@fonts</code> : Correcting	<code>\footnote</code> : (RmS) Added
missing name after <code>\tracingon</code> . . 396	<code>\let\protect\noexpand</code> in
1991-03-28 ltfsini.dtx v1.1m	<code>\footnote</code> , <code>\footnotemark</code> , and
<code>\copyright</code> : Extra braces added. . . 461	<code>\footnotetext</code> , since <code>\xdef</code> is
1991-03-30 ltfsini.dtx v1.2g	used 698
<code>\newfont</code> : Definition added. 459	1991-11-04 ltlists.dtx LaTeX2.09
<code>\symbol</code> : Definition added. 460	<code>\makelabel</code> : (RmS) added default
1991-07-24 ltmiscen.dtx LaTeX2.09	definition for <code>\makelabel</code> , to
<code>\@verbatim</code> : Added	produce an error message. 586
<code>\penalty\interlinepenalty</code> to	1991-11-04 ltplain.dtx RmS
definition of <code>\par</code> so that	General: Removed <code>\itemitem</code> since
<code>\samepage</code> works 552	never needed/useful with L ^A T _E X. . . 29
1991-08-14 ltmath.dtx LaTeX2.09	1991-11-06 ltbibl.dtx LaTeX2.09
<code>\cases</code> : (RmS) inserted extra braces	<code>\citex</code> : added code to remove a
around entry for NFSS 562	leading blank 706

1991-11-13 ltbib1.dtx LaTeX2.09	avoid conflicts with other channels allocated by <code>\newread</code>	71
<code>\@bibitem</code> : Changed counter <code>enumi</code> to <code>enumiv</code> , as it says in the comment above		706
1991-11-21 ltfssini.dtx v1.1o	<code>\xympar</code> : (RmS) added <code>\global\@ignorefalse</code>	693
<code>\reset@font</code> : Added extra braces for robustness.	<code>\end@float</code> : (RmS) changed <code>\@esphack</code> to <code>\@Esphack</code>	461
Changed to protected version of macro.		461
1991-11-22 ltfloat.dtx LaTeX2.09	1992-03-18 ltfloat.dtx LaTeX2.09	
<code>\footnote</code> : (RmS) Added <code>\let\protect\noexpand</code> in <code>\@xfootnote</code> , <code>\@xfootnotemark</code> , and <code>\@xfootnotetext</code>	<code>\trivlist</code> : RmS: added <code>\@nmbrlistfalse</code>	582
1991-11-22 ltlists.dtx LaTeX2.09	1992-03-18 ltmiscen.dtx LaTeX2.09	
<code>\@item</code> : (RmS) Changed second call to <code>\makelabel</code> to <code>\unhbox\@tempboxa</code> . Avoids problems with side effects in <code>\makelabel</code> and is more efficient.	<code>\begin</code> : Changed <code>\@ignoretrue</code> to <code>\@ignorefalse</code> (as documented)	544
1991-11-27 ltfssbas.dtx v1.3a	1992-03-21 ltfssini.dtx v1.2d	
General: All <code>\family</code> , <code>\shape</code> etc. renamed to <code>\fontfamily</code> etc.	General: Renamed <code>\text</code> to <code>\nfss@text</code> to make it internal.	441
1991-11-27 ltfssini.dtx v1.2a	1992-05-12 ltfssbas.dtx v1.3c	
General: All <code>\family</code> , <code>\shape</code> etc. renamed to <code>\fontfamily</code> etc.	<code>\extract@alph@from@version</code> : Macro added.	357
1992-01-06 ltfssini.dtx v1.2c	<code>\select@group</code> : Added call to <code>\extract@alph@from@version</code>	357
General: added <code>slitex</code> code	1992-07-26 ltfssbas.dtx v1.9a	
1992-01-10 ltbib1.dtx LaTeX2.09	<code>\curr@fontshape</code> :	348
<code>\@bibitem</code> : Changed <code>\c@enumiv</code> to <code>\value of \@listctr</code>	<code>\DeclareFontShape</code> : Introduced <code>\DeclareFontShape</code>	337
1992-01-10 ltmath.dtx LaTeX2.09	<code>\define@newfont</code> :	348
<code>equation</code> : RmS: put <code>\hbox</code> around <code>\@eqnnum</code> to typeset the equation number in text mode (as in the <code>eqnarray</code> env.)	<code>\math@fonts</code> :	356
1992-01-10 ltthm.dtx LaTeX2.09	<code>\select@group</code> :	356, 357
<code>\@othm</code> : (RmS) Check for existence of theorem environment	<code>\split@name</code> : Added splitting into <code>\f@encoding</code>	348
1992-01-14 ltbib1.dtx LaTeX2.09	<code>\wrong@fontshape</code> :	353, 354
<code>\@biblabel</code> : removed <code>\hfill</code>	1992-07-26 ltfssstrc.dtx v2.0b	
1992-01-14 ltsect.dtx 0.0	<code>\s@fct@</code> :	405
<code>\@starttoc</code> : (RmS) added <code>\immediate</code> to <code>\openout</code> as all <code>\write</code> commands are also executed <code>\immediate</code>	<code>\s@fct@sub</code> : documentation fixes	406
1992-02-26 ltbib1.dtx LaTeX2.09	<code>\selectfont</code> :	389
<code>\@lbibitem</code> : Added <code>\hfill</code> to restore left-alignment of bibliography labels in alpha style	<code>\try@simple@size</code> :	399
1992-03-18 ltdefns.dtx LaTeX2.09	<code>\try@size@range</code> :	403
General: (RmS) changed input channel from 0 to <code>\@inputcheck</code> to	<code>\use@mathgroup</code> :	396
	1992-08-14 ltbib1.dtx LaTeX2.09	
	<code>\@citex</code> : added missing argument braces around <code>\hbox</code> , found by Ed Sznyter	706
	1992-08-14 ltboxes.dtx LaTeX2.09	
	<code>\endminipage</code> : (RmS) replaced <code>\vskip</code> - <code>\lastskip</code> by <code>\unskip</code> (proposed by FMI)	600
	1992-08-17 ltbib1.dtx LaTeX2.09	
	<code>\@citex</code> : simplified code for removing leading blanks in citation key (proposed by Frank Jensen and Kresten Krab Thorup)	706
	1992-08-19 ltsect.dtx 0.0	
	<code>\@xsect</code> : (RmS) corrected bug: stretch and shrink in argument to <code>\hskip</code>	

previously not negated	671	<code>\footnote:</code> (RmS) Changed all to 'def'protect'noexpand'protect'noexpand	698
1992-08-19 ltthm.dtx LaTeX2.09		1992-12-03 ltffssini.dtx v?	
<code>\@othm:</code> (RmS) Changed error message to complain about undefined counter	664	<code>\hexnumber@:</code> Make it accept counters.	460
1992-08-20 ltffssini.dtx v1.4b		1993-03-08 preload.dtx v2.0b	
<code>\@setsize:</code> Added <code>\@currsize.</code> . . .	460	General: Added 12pt preloads	486
1992-08-24 ltdefns.dtx LaTeX2.09		1993-03-18 ltffsbas.dtx v2.0c	
<code>\@ifnextchar:</code> (Rms) <code>\@ifnextchar</code> didn't work if its first argument was an equal sign.	93	General: Changed all <code>\@tempdima</code> in <code>\@tempdimb</code> to avoid killing <code>\numberline</code>	336
1992-08-24 ltmiscen.dtx LaTeX2.09		1993-03-18 ltfsstrc.dtx v2.1b	
<code>\begin:</code> Added code to <code>\begin</code> to remember line number. Used by <code>\@badend</code> to display position of non-matching <code>\begin.</code>	544	General: Changed all <code>\@tempdima</code> in <code>\@tempdimb</code> to avoid killing <code>\numberline</code>	384
<code>\verb:</code> Changed <code>\verb</code> and <code>\@sverb</code> to work correctly in math mode . . .	557	Changed all <code>\@tempdimb</code> in <code>\@tempdimx</code> to avoid killing <code>\numberline</code>	384
1992-08-25 ltsect.dtx LaTeX2.09		1993-03-18 ltfsstrc.dtx v2.1c	
<code>\@sect:</code> (FMi) replaced explicit setting of <code>\@svsec</code> by call to <code>\@seccntformat</code>	670	<code>\DeclareSizeFunction:</code> Added all args to avoid blanks problems . .	402
1992-09-18 ltlists.dtx LaTeX2.09		1993-04-09 lterror.dtx v1.0e	
<code>\item:</code> (RmS) Added warning if <code>\item</code> is used in math mode	584	<code>\@latexerr:</code> Mention The Companion	233
1992-09-18 lttab.dtx LaTeX2.09		1993-04-11 lterror.dtx v1.0f	
<code>\@array:</code> Changed <code>\par</code> to <code>\@empty</code> to avoid starting new row e.g. after <code>\hline</code>	618	<code>\@latexerr:</code> Remove setting of errorcontextlines	233
1992-09-19 ltfsstrc.dtx v2.0c		1993-05-05 ltftncmd.dtx v2.0b	
<code>\try@simple@size:</code>	399	General: Removed all LaTeX related cmds	489
1992-09-21 ltffssini.dtx v1.4d		1993-05-16 ltffsbas.dtx v2.0e	
<code>\not@math@alphabet:</code> Macro defined. .	459	<code>\showhyphens:</code> Use <code>\reset@font</code> . .	359
1992-09-22 ltffsbas.dtx v1.91a		1993-07-16 ltfsstrc.dtx v2.1h	
General: Introduced <code>\tf@size</code> for math size.	336	General: Changed layout of info messages	384
1992-09-22 ltfsstrc.dtx v2.1a		1993-07-17 ltoutenc.dtx 1.0d	
<code>\getanddefine@fonts:</code> Introduced <code>\tf@size</code> for math size.	396	General: changed <code>\catcoding @</code> . . .	283
1992-11-13 ltffssini.dtx v?		1993-08-03 ltmiscen.dtx LaTeX2.09	
<code>\hexnumber@:</code> Made expandable. . . .	460	<code>\enddocument:</code> Changed redefinition of <code>\global</code> to redefinition of <code>\@setckpt.</code>	538
1992-11-23 ltcounts.dtx LaTeX2.09		1993-08-05 ltpictur.dtx LaTeX2.09	
<code>\stepcounter:</code> Replaced <code>{}</code> in <code>\stepcounter</code> by <code>\begingroup</code> <code>\endgroup</code> to avoid adding an empty ord in math mode	328	<code>\circle:</code> (RMS) Added error message if <code>\circle</code> is used in math mode. .	655
1992-11-26 ltboxes.dtx LaTeX2.09		1993-08-05 ltsect.dtx LaTeX2.09	
<code>\@mpfootnotetext:</code> (RmS) added protection for <code>\edef</code>	601	<code>\@sect:</code> (RmS) Made sure that <code>\protect</code> works correctly in expansion of <code>\the</code> counter	670
1992-11-26 ltfloat.dtx LaTeX2.09		1993-08-05 ltspac.dtx LaTeX2e	
<code>\@footnotetext:</code> (RmS) added protection for <code>\edef</code>	698	<code>\@hspace:</code> (RmS) Removed superfluous <code>\leavevmode</code> in <code>\@hspace</code> and <code>\@hspace,</code> as suggested by CAR.	257

1993-08-05 lttab.dtx latex2e			
\tabular*: Replaced			
\expandafter\def by \@namedef.	617		
1993-08-06 ltbibl.dtx LaTeX2.09			
\@citex: Moved writing to .aux file in			
loop over citation keys so that			
leading blanks are removed there			
as well.	706		
1993-08-13 ltoutenc.dtx 1.0f			
General: Protected against active @			
sign.	283		
1993-08-13 preload.dtx v2.0c			
General: Added \relax at end of font			
names.	487		
1993-08-16 ltoutenc.dtx 1.0g			
General: Needs space after \string	283		
1993-08-18 ltfsdcl.dtx v2.0e			
\new@mathversion: Exchanged names			
of encodings in warning message of			
\SetSymbolFont.	423		
1993-09-02 ltfsstrc.dtx v2.1i			
General: Corrected name of sgen size			
function.	384		
1993-09-03 ltmiscen.dtx LaTeX2.09			
\verbatim@nolig@list: Replaced			
\@noligs by extensible list	557		
1993-09-07 ltmiscen.dtx LaTeX2.09			
\verb@balance@group: (RmS)			
Changed definition of \verb so			
that it detects a missing second			
delimiter.	556		
1993-09-08 ltmiscen.dtx LaTeX2.09			
\enddocument: Added warning in case			
of undefined references.	538		
1993-09-15 ltfsbas.dtx v2.0g			
\DeclareFontEncoding: Corrected:			
\default@T to \default@M.	340		
1993-09-15 ltfsstrc.dtx v2.1j			
General: Corrected spelling of			
\noxpand.	384		
1993-09-19 lterror.dtx LaTeX2.09			
\@invalidchar: (RmS) Error message			
for invalid input characters.	236		
1993-11-02 ltmath.dtx LaTeX2.09			
General: RmS: Corrected description			
of \@eqnset, moved \@eqnset			
accordingly and removed extra			
\tabskip assignment.	567		
1993-11-03 ltmath.dtx LaTeX2e			
General: RmS: Initialized \everycr to			
empty	567		
1993-11-03 ltpictur.dtx LaTeX2.09			
General: (RmS) changed \halign to			
\ialign to initialize \tabskip and			
\everycr	635		
1993-11-11 ltfsini.dtx v2.1a			
\normalfont: Macro added	461		
1993-11-11 ltfsstrc.dtx v2.2a			
General: Option concept added for			
LaTeX2e	384		
1993-11-14 ltclass.dtx v0.2a			
\@currentx: Name changed from			
\@currentextension	719		
\@reset@ptions: macro added	742		
\AtEndDocument: Included extension			
in the generated macro name for			
package and class hooks.	743		
\documentstyle: Added			
\RequirePackage			
\@unusedoptionlist stuff.	732		
\load@onefilewithoptions: Moved			
resetting of \default@ds, \ds@ and			
\@declaredoptions here, from the			
end of \ProcessOptions.	737		
\NeedsTeXFormat: made more robust			
for alternative syntax for other			
formats.	734		
\ProcessOptions*: Optimize ‘empty			
option’ code.	729		
Stop adding the global option list			
inside class files.	729		
1993-11-14 ltdefs.dtx v0.2a			
\g@addto@macro: Made global	98		
1993-11-15 ltclass.dtx v0.2b			
\documentstyle: Modified to match			
\ProcessOption*	732		
\ProcessOptions*: Star form added.	729		
1993-11-17 ltclass.dtx v0.2c			
\@fileswith@ptions: Macro added	742		
\@badrequireerror: Macro added	744		
\@twoloadclasserror: Macro added	744		
\CurrentOption: Name changed from			
\@curroption	719		
\DeclareOption*: Error checking			
added	728		
\load@onefilewithoptions: Added			
trap for two \LoadClass			
commands.	739		
\NeedsTeXFormat: Name changed from			
\NeedsFormat	734		
\ProcessOptions*: restoring			
\@fileswith@ptions added.	729		
1993-11-18 ltclass.dtx v0.2d			
\documentstyle: Modified			
\RequirePackage stuff.	732		
\ExecuteOptions: Use			
\CurrentOption not \reserved@a	732

<code>\input</code> : Macro reimplemented	275	1993-12-07 ltoutenc.dtx 1.1	
		General: Protected all special	
		characters with <code>\string</code>	283

1993-12-07 ltoutenc.dtx v1.1	1993-12-11 ltmath.dtx v0.9g
General: Made all character numbers	General: Added a group around the
decimal. 280	first argument of <code>\frac</code> to prevent
Removed a lot of equal signs and	changes (for example font changes)
the like. 280	from modifying the contents of the
1993-12-08 ltboxes.dtx v0.1b	second argument. 567
<code>\@begin@tempboxa</code> : Extra braces for	1993-12-11 ltoutenc.dtx v1.2a
color support (braces removed	General: Corrected for <code>tlenc</code> , <code>math</code> . 280
from other macros) 591	1993-12-11 ltsect.dtx LaTeX2e
<code>\@irsbox</code> : fix typo 603	<code>\author</code> : Added default 666
<code>\@parboxto</code> : <code>\endgraf</code> added due to	<code>\title</code> : Added default 666
extra group in <code>\@begin@tempboxa</code> 598	1993-12-11 ltxref.dtx LaTeX2e
<code>\lrbox</code> : move <code>\@endpfalse</code> out of the	<code>\setref</code> : Macro added 534
inner group 594	<code>\pageref</code> : Macro reimplemented . . . 534
1993-12-08 ltfntcmd.dtx v2.1b	<code>\ref</code> : Macro reimplemented 534
General: Macros <code>\rm</code> , <code>\bf</code> and <code>\sf</code>	1993-12-12 ltoutput.dtx v1.0h
moved to <code>classes.dtx</code> 497	<code>\@cflb</code> : <code>boxmaxdepth</code> setting moved 842
1993-12-08 ltlists.dtx LaTeX2e	defs changed to <code>lets</code> 842
<code>\@item</code> : use <code>\sbox</code> to support colour 585	<code>\@cflt</code> : name changed 842
1993-12-08 ltspace.dtx LaTeX2e	<code>\@docclearpage</code> : defs changed to
<code>\@bsphack</code> : Command reimplemented 247	<code>lets</code> 833, 834
Command reimplemented; late	<code>\@makecol</code> : defs changed to <code>lets</code> . . . 835
birthday present for Chris 247	<code>\@resetthfps</code> : Warnings added:
<code>\@vbsphack</code> : Command added 250	minimal 873
1993-12-09 ltboxes.dtx v0.1c	<code>\@startdblcolumn</code> : defs changed to
<code>\@irsbox</code> : fix another typo 603	<code>lets</code> 844, 845
1993-12-09 ltclass.dtx v0.2n	<code>\@topnewpage</code> : braces removed 826
<code>\documentstyle</code> : input 209	<code>\@tryfcolumn</code> : defs changed to <code>lets</code> . 845
compatibility file. 732	<code>\fl@tracemessage</code> : Commands
1993-12-09 ltfiles.dtx v0.9e	changed 869
<code>\document</code> : Hook added 262	1993-12-13 ltclass.dtx v0.2o
1993-12-09 ltmiscen.dtx v0.9e	General: Removed setting
<code>\enddocument</code> : Hook added 538	<code>\errorcontextlines</code> (now in
1993-12-10 ltoutenc.dtx v1.2	<code>latex.tex</code>) 718
General: Added source code for	<code>\documentstyle</code> : compatibility file
<code>tlenc.sty</code> 280	now <code>latex209.sty</code> 732
1993-12-11 ltfntcmd.dtx v3.0a	<code>\usepackage</code> : Fixed error handling . 734
General: Complete reworking of all	1993-12-13 ltdirchk.dtx v0.2a
text commands, using just one	General: on the ‘docstrip’ pass, do not
creator function 489	check <code>openin</code> path 10
italic correction now put in front of	<code>\IfFileExists</code> : Removed interactive
penalty before glue 489	prompting for current directory
newcommands replaced by defs . . 489	syntax 10
newfontswitch command corrected	<code>\strip@prefix</code> : modified, name
and changed 489	changed from <code>\stripmeaning</code> 5
<code>\DeclareTextFontCommand</code> : Macro	1993-12-13 ltlists.dtx latex2e
changed 491	<code>\trivlist</code> : Initialised <code>\@itemlabel</code> 582
<code>\emph</code> : Macro changed 492	1993-12-13 ltmiscen.dtx v0.9h
<code>\fix@penalty</code> : Macro added 495	<code>\@noligs</code> : Readded <code>\@noligs</code> 557
<code>\maybe@ic</code> : Macro name changed . . 494	<code>\@verbatim</code> : Readded <code>\@noligs</code> . . . 553
<code>\maybe@ic@</code> : Macro and name	Removed optional argument of
changed 494	<code>\item</code> 552
<code>\sw@slant</code> : Macro changed 495	<code>center</code> : Removed optional argument
<code>\textup</code> : Macros changed 492	of <code>\item</code> 550

<code>flushleft</code> : Removed optional argument of <code>\item</code>	551	Removed the catcode hackery, since the file is only read as a package in the preamble, and removed all the messages on the screen, which just confuse users. Replaced them by the appropriate <code>\ProvidesPackage</code> commands. Added <code>XXXenc</code>	283
<code>flushright</code> : Removed optional argument of <code>\item</code>	551		
1993-12-13 <code>ltoutenc.dtx</code> v1.2b			
General: Corrected file name in driver code.	280		
1993-12-13 <code>lftab.dtx</code> latex2e		1993-12-17 <code>ltoutenc.dtx</code> v1.3	
<code>\tabbing</code> : Removed optional argument of <code>\item</code>	612	General: Added	
1993-12-14 <code>ltoutput.dtx</code> v1.0i		<code>\EncodingSpecificAccent</code> , <code>\EncodingSpecificAccentedLetter</code> and <code>\EncodingSpecificCommand</code>	280
General: Section added to declare all parameters	881	Made Rokicki's encoding a proper encoding scheme rather than a variant of OT1.	280
1993-12-15 <code>ltboxes.dtx</code> v0.1d		1993-12-17 <code>ltoutput.dtx</code> v1.0j	
<code>\iminipage</code> : Changed default from 'c' to 's'	600	<code>\@opcol</code> : Hook removed	834
<code>\iparbox</code> : Changed default from 'c' to 's'	597	<code>\@specialoutput</code> : Page room test added	829
<code>\minipage</code> : Changed default from 'c' to 's'	599	<code>\@topnewpage</code> : check for vsize too small added	826
extra space removed.	599	Page room test added	828
<code>\parbox</code> : Changed default from 'c' to 's'	597	<code>\@writesetup</code> : —and then removed	838
1993-12-15 <code>ltclass.dtx</code> v0.2p		<code>\fl@tracemessage</code> : tracefloatvals made a document command	869
General: Removed extra 's' from <code>@@warnings</code>	718	1993-12-17 <code>ltpage.dtx</code> LaTeX2e	
1993-12-16 <code>ltlogos.dtx</code> LaTeX2e		<code>\mark</code> : Removed init <code>\mark</code> at begin document, since it doesn't work.	712
<code>\LaTeXe</code> : Extended logo by DPC	259	<code>\rightmark</code> : Stopgap solution to mark <code>\leftmark</code> and <code>\rightmark</code> work without initializing mark until the problem is solved.	712
1993-12-16 <code>ltmath.dtx</code> v0.9i			
<code>\@eqnocr</code> : use <code>\refstepcounter</code> instead of shortcut	569	1993-12-18 <code>ltoutenc.dtx</code> 1.3b	
General: use <code>\refstepcounter</code> instead of shortcut	567	General: Fixed typos with <code>\ProvidesPackage</code> lines. Added the <code>\NeedsTeXFormat</code> line. Added the last argument to <code>\DeclareEncoding</code> . Moved the use of the encodings to after their declaration.	283
1993-12-16 <code>ltmiscen.dtx</code> v0.9i		Replaced the missing last argument to <code>\DeclareFontEncoding</code>	296, 298
General: <code>\literal</code> added	557	1993-12-18 <code>ltoutenc.dtx</code> 1.3c	
1993-12-16 <code>ltpage.dtx</code> LaTeX2e		General: Rewrote for the new syntax of <code>\EncodingSpecific</code>	296, 298
<code>\mark</code> : Init <code>\mark</code> at begin document	712	Split <code>\EncodingSpecificAccent</code> up into <code>\EncodingSpecific</code> and <code>\DeclareAccent</code>	284
1993-12-16 <code>ltspace.dtx</code> LaTeX2e		1993-12-18 <code>ltoutenc.dtx</code> v1.3a	
<code>\@bsphack</code> : Corrected optimisation :-)	247	General: Replaced OT3 by XXX	280
1993-12-16 <code>lftab.dtx</code> latex2e		1993-12-18 <code>ltoutenc.dtx</code> v1.3b	
<code>\@xhline</code> : Measure from middle of vertical rules	627	General: Corrected typos.	280
1993-12-17 <code>ltclass.dtx</code> v0.2q		Replaced the missing last argument to <code>\DeclareFontEncoding</code>	280
<code>\@documentclasshook</code> : Macro added	718		
<code>\@fileswithoptions</code> : Add <code>\@compatibility</code> hook	735		
<code>\documentstyle</code> : Match Alan's new code.	732		
1993-12-17 <code>ltoutenc.dtx</code> 1.3			
General: Added this section	284		
Removed all the hackery for use in <code>\DeclareFontEncoding</code> , and redid everything using <code>\DeclareTextFoo</code>	296, 298		

1993-12-18 ltoutenc.dtx v1.3c	1994-01-17 ltclass.dtx v0.2s
General: A new syntax, separating accent-definitions from encoding-specific definitions, and allowing encoding-specific <code>\chardef</code> , <code>\let</code> , etc. 280	<code>\@fileswithoptions</code> : Modify to reduce parameter stack usage . . . 735
Rewrote for the new syntax of <code>\EncodingSpecific</code> 280	General: Added many more <code>\@onlypreamble</code> commands 718
1993-12-18 ltoutenc.dtx v1.3d	Wrapped long lines to column 72 718
General: Some T1 stuff had drifted into the OT1 file. 280	<code>\load@onefile@withoptions</code> : Modify to reduce parameter stack usage 740
1993-12-18 ltpage.dtx LaTeX2e	1994-01-17 ltfiles.dtx LaTeX2e
<code>\sloppy</code> : Added <code>\emergencystretch</code> 712	<code>\listfiles</code> : New Version, adds ‘tex’ if needed, and lines up columns . 278
1993-12-19 ltclass.dtx v0.2r	1994-01-17 ltfssbas.dtx v2.1a
<code>\endfilecontents</code> : Different message when ignoring a file 745	General: New math font setup 336
1993-12-19 ltfntcmd.dtx v3.0b	<code>\curr@math@size</code> : New math font setup 348
General: <code>\@pdef</code> command added . . 489	<code>\everydisplay</code> : New math font setup 347
Added by ASAJ. 497	<code>\everymath</code> : New math font setup . 347
Made <code>\@newfontswitch</code> produce an error if command already exists, and added <code>\@renewfontswitch</code> , ASAJ 489	<code>\frozen@everydisplay</code> : New math font setup 348
Other tidying 489	<code>\frozen@everymath</code> : New math font setup 347, 348
Some more tidying done 489	<code>\math@version</code> : New math font setup 347
Untidying added, so this is now a TEMPORARY version. 489	1994-01-17 ltfssini.dtx v2.1e
Wording changes by CAR. 497	<code>\not@math@alphabet</code> : Message changed 459
<code>\DeclareOldFontCommand</code> : Corrected and tidied 496	1994-01-17 ltfssstrc.dtx v2.3a
<code>\DeclareTextFontCommand</code> : Corrected and tidied 491	General: New math font setup 384
1993-12-19 ltspace.dtx LaTeX2e	<code>\check@mathfonts</code> : New math font setup 394
<code>\@bsphack</code> : There seem to be problems with selfmade birthday presents . 248	<code>\glb@currsize</code> : New math font setup 392
1993-12-20 ltdefs.dtx LaTeX2e	<code>\restglb@settings</code> : New math font setup 395
<code>\@reargdef</code> : Kept old version of <code>\@reargdef</code> , for array.sty 74	1994-01-18 ltbibl.dtx LaTeX2e
1993-12-20 ltfiles.dtx v0.9m	<code>\bibliography</code> : Use <code>\@input@</code> so include files are listed. 707
<code>\@obsoletefile</code> : Added this command, removed <code>@oldfilewarning</code> 278	1994-01-18 ltclass.dtx v0.2t
1994-01-05 fontdef.dtx v2.1d	<code>\@ifclassloaded</code> : Fix typo <code>\@pkgetension</code> 722
General: Removed nf prefix from file names. 467	1994-01-18 ltfilehook.dtx v0.9p
1994-01-13 ltmath.dtx v0.9o	<code>\unqu@tefilef@und</code> : New Definition 772
<code>\@eqnocr</code> : correcting 0.9i 569	1994-01-18 ltfiles.dtx v0.9p
General: correcting 0.9i 567	<code>\@iffileonpath</code> : Macro added 274
1994-01-14 ltdirchk.dtx v0.2d	<code>\@input</code> : do not use a different definition for <code>\input@path</code> 276
<code>\IfFileExists</code> : Close the texsys.aux output stream 10	<code>\@input@</code> : Macro added 276
1994-01-15 ltfiles.dtx v0.9o	<code>\IfFileExists@</code> : New Definition . . 273
<code>\document</code> : move <code>\@preamblecmds</code> after document hook 264	<code>\includeonly</code> : Use <code>\@input@</code> so include files are listed. 268
	1994-01-18 ltfssini.dtx v2.1f
	<code>\not@math@alphabet</code> : Message corrected 459
	1994-01-18 ltmiscen.dtx v0.9p
	<code>\@verbatim</code> : Add <code>\global\@inlabelfalse</code> 552

Only add <code>\penalty</code> if in hmode	552	<code>\restgls@settings</code> : Correct trace info placement	395
1994-01-19 fontdef.dtx v2.1e		1994-01-27 ltfntcmd.dtx v3.1a	
General: Added missing setting for symbols in bold version.	472	<code>\nocorrlist</code> : Only <code>.</code> , used as default for cm fonts	496
1994-01-19 ltdirchk.dtx v0.2e		1994-01-29 ltclass.dtx v0.2v	
<code>\IfFileExists</code> : name changed from <code>\test</code>	9	<code>\@unprocessedoptions</code> : Macro added.	744
<code>\input@path</code> : No longer check that an empty group is in the path	10	<code>\load@onefile@withoptions</code> : All options raise error if no <code>\ProcessOptions</code> appears	740
<code>\strip@prefix</code> : name changed from <code>\strip@meaning</code> , to match NFSS.	5	1994-01-31 ltdefs.dtx v0.2w	
1994-01-19 ltmath.dtx v1.0n classes		<code>\g@addto@macro</code> : Use toks register to avoid ‘hash’ problems	98
<code>\mathindent</code> : Deferred setting of <code>\mathindent</code>	570	1994-01-31 ltfiles.dtx v0.9t	
1994-01-20 ltdirchk.dtx v0.2f		<code>\document</code> : set <code>\@normalsize</code> or <code>\normalsize</code> if necessary	263
General: <code>\@copytexsys</code> and the <code>texsys.new</code> file removed	8	1994-01-31 ltfntcmd.dtx v3.1b	
Modify all of <code>ltxcheck</code>	13	General: <code>\@normalsize</code> no longer defined	489
<code>\IfFileExists</code> : <code>\@copytexsys</code> removed	10	1994-02-01 ltpage.dtx LaTeX2e	
1994-01-21 ltclass.dtx v0.2u		<code>\pagestyle</code> : (DPC) Modify to get nicer error message	710
<code>\documentstyle</code> : compatibility file now <code>latex209.def</code>	732	<code>\thispagestyle</code> : (DPC) Modify to get nicer error message	711
1994-01-21 ltdirchk.dtx v0.2g		1994-02-02 ltclass.dtx v0.2x	
General: Improve documentation, reorganize <code>docstrip</code> module	1	<code>\load@onefile@withoptions</code> : Only run the hook and options check if the file was loaded.	740
<code>\filename@parse</code> : Minor changes, and add Mac version (<code>:</code>)	11	1994-02-03 ltoutput.dtx v1.0k	
<code>\today</code> : Name changed from <code>\stamp</code> , to save memory	9	<code>\@makespecialcolbox</code> : correct mistakes in the documentation	837
1994-01-21 ltfloat.dtx LaTeX2e		1994-02-07 ltclass.dtx v0.2y	
<code>\xfloat</code> : Added missing percent characters.	683	<code>\@fileswithoptions</code> : Run <code>\@compatibility</code> on the first class to start (not the first to finish)	735
1994-01-21 ltmiscen.dtx v0.9s		<code>\@ifclasswith</code> : Add extra <code>,s</code> so ‘two’ is not matched with ‘twocolumn’	724
<code>\verbatim@font</code> : Removed unnecessary category code hackery.	553	<code>\ProcessOptions*</code> : Add extra <code>,s</code> so ‘two’ is not matched with ‘twocolumn’	730
1994-01-24 ltdirchk.dtx v0.2h		1994-02-07 ltfssbas.dtx v2.1c	
<code>\IfFileExists</code> : Stop testing once <code>texsys.aux</code> has been found	9	<code>\DeclareFontEncoding</code> : revert catcode settings earlier	340
1994-01-24 ltpage.dtx LaTeX2e		<code>\DeclareFontShape@</code> : revert catcode settings earlier	337
<code>\pagestyle</code> : (DPC) Complain if <code>pagestyle</code> is undefined.	710	1994-02-08 ltoutput.dtx v1.0k	
1994-01-25 ltdirchk.dtx v0.2i		<code>\@makespecialcolbox</code> : <code>boxmaxdepth</code> setting added	837
General: Protect against looping on <code>\@input</code> and <code>\@end</code>	2	<code>boxmaxdepth</code> setting removed	836
1994-01-25 ltfssbas.dtx v2.1b		General: Documentation and tasks tidied.	811
<code>\math@version</code> : Corrections for math setup	347		
1994-01-25 ltmath.dtx LaTeX2e			
<code>\bordermatrix</code> : Removed <code>\p@renwd</code>	562		
1994-01-26 ltfsssrc.dtx v2.3c			
<code>\check@mathfonts</code> : Correct trace info placement	394		

1994-02-10 ltclass.dtx v0.2z	1994-03-07 ltboxes.dtx v0.1a
\@documentclasshook: Changed the name from \@compatibility to \@documentclasshook, and added the check for whether \@normalsize has been defined. ASAJ. 718	\@mpfootnotetext: Extra group for color 601
\@fileswithoptions: Renamed \@compatibility to \@documentclasshook. ASAJ. . . 735	1994-03-07 ltboxes.dtx v1.0a
1994-02-10 ltssbas.dtx v2.1d	General: Unify format with other Kernel files 590
\addto@hook: Made \addto@hook long. 361	1994-03-07 ltdefs.dtx v1.0a
1994-02-10 ltsscmp.dtx v2.1d	\@italiccorr: Macro added 70
\scan@fontshape: scan away stuff after pt 410	1994-03-07 ltfiles.dtx v1.0a
1994-02-22 ltssini.dtx v2.1g	General: Initial version, split from latex.dtx 260
General: Correct error message 462	Long lines wrapped to 72 columns 260
1994-02-24 ltssbas.dtx v2.1e	1994-03-07 ltfinal.dtx v0.1a
\DeclareFontShape: Separate restoration of catcodes for fd cmds 337	General: Add code from the old dump.dtx 899
\define@newfont: Separate restoration of catcodes for fd cmds 349	Initial version, split from latex.dtx 886
\nfss@catcodes: Separate restoration of catcodes for fd cmds 350	move code here from lhyphen.dtx 891
1994-02-25 ltdirchk.dtx v0.2j	Remove oldcomments environment 886
General: Remove need for drv file 1	use \InputIfFileExists not \IfFileExists 891
1994-03-01 ltdirchk.dtx v0.2k	1994-03-07 ltfloat.dtx v1.0a
General: Add unstripped module, so that dircheck.dtx may be used with initex 1	\@endfloatbox: (DPC) Extra group for colour 688
1994-03-02 ltboxes.dtx v0.1e	\@footnotetext: (DPC) Extra group for colour 698
General: Add 2kernel module 590	\@xfloat: (DPC) Extra group for colour 684
Remove need for drv file 590	1994-03-07 lthyphen.dtx v0.1c
1994-03-02 ltclass.dtx v0.3a	General: move the 2kernel code to ltfinal.dtx 884
General: Remove need for driver file 718	1994-03-07 ltlength.dtx v1.0a
1994-03-03 ltboxes.dtx v0.1f	\@settodim: (DPC) Extra group for colour 334
\@irsbox: Replaced a missing \else 603	1994-03-07 ltlists.dtx v1.0a
1994-03-04 ltfloat.dtx v1.0a	General: Initial version, split from latex.dtx 574
General: Initial version, split from latex.dtx 679	Long lines wrapped to 72 columns 574
1994-03-04 ltsect.dtx v1.0a	1994-03-07 ltpage.dtx v1.0a
General: Initial version, split from latex.dtx 666	General: Initial version, split from ltherest.dtx 710
1994-03-04 lttab.dtx v1.0a	1994-03-07 ltpictur.dtx v0.1a
General: Initial version, split from latex.dtx 605	General: Initial version, split from latex.dtx 630
1994-03-04 ltvers.dtx v1.0a	Long lines wrapped to 72 columns 630
General: Initial version, split from latex.dtx 34	1994-03-07 ltsect.dtx v1.0a
	\@hangfrom: (DPC)Extra groups for colour 673
	1994-03-07 lttab.dtx v1.0a
	General: Long lines wrapped to 72 columns 605
	1994-03-08 ltclass.dtx v0.3b
	General: Modify driver code into ‘new style’ 718

1994-03-08 ltdirchk.dtx v1.0a		<code>\listfiles</code> : Reset <code>\@addtofilelist</code>	
General: Reorganize driver module		at begin document	279
into ‘new style’	1		
1994-03-08 ltplain.dtx v1.0a		1994-03-13 ltssbas.dtx v2.1g	
General: Remove need for a driver file.	14	General: add 2kernel module to omit	
1994-03-10 ltssbas.dtx v2.2f		repeated code	336
<code>\math@egroup</code> : Changed		1994-03-13 ltssdcl.dtx v2.1c	
<code>\begingroup/\endgroup</code> to		General: add 2kernel module to omit	
<code>\bgroup/\egroup</code> .	358	repeated code	414
1994-03-11 ltssdcl.dtx v2.1b		1994-03-14 ltboxes.dtx v1.0b	
<code>\DeclareSymbolFontAlphabet@:</code>		<code>\isavebox</code> : Use <code>\color@setgroup</code>	594
Added check against use of		<code>\isavepicbox</code> : Use	
alphabet switch outside of math		<code>\color@setgroup</code>	594
mode.	439	<code>\color@begingroup</code> : macro added for	
<code>\SetMathAlphabet@:</code> Changed		color support	593
parameter template in temporary		<code>\color@endgroup</code> : macro added for	
macro to catch check add below.	428	color support	593
1994-03-12 ltclass.dtx v0.3c		<code>\lrbox</code> : Use <code>\color@setgroup</code>	594
General: Change name from docclass		<code>\sbox</code> : Use <code>\color@setgroup</code>	594
to ltclass	718	1994-03-14 ltfloat.dtx 1.0c	
<code>\ProvidesFile</code> : Add <code>\wlog</code>	727	<code>\xympar</code> : (DPC) Use	
<code>\ProvidesPackage</code> : Add <code>\wlog</code>	725	<code>\color@begingroup</code>	693
use <code>\@gtempa</code>	725	1994-03-14 ltfloat.dtx v1.0c	
1994-03-12 ltdefs.dtx v1.0b		<code>\@endfloatbox</code> : (DPC) Use	
<code>\@reargdef</code> : New defn, in terms of		<code>\color@endgroup</code>	688
<code>\@yargdef</code>	74	<code>\@footnotetext</code> : (DPC) Use	
<code>\@yargdef</code> : Name changed from		<code>\color@begingroup</code> , add	
<code>\XXX@argdef</code>	74	<code>\endgraf</code>	698
1994-03-12 ltdirchk.dtx v1.0b		<code>\@savemarbox</code> : (DPC) Use	
General: Change name from		<code>\color@begingroup</code>	692
dircheck.dtx	1	<code>\@xfloat</code> : (DPC) Use	
Minor edits to the typeouts in		<code>\color@begingroup</code>	684
ltxcheck	1	1994-03-15 ltfiles.dtx LaTeX2e	
1994-03-12 ltfloat.dtx v1.0b		<code>\@missingfileerror</code> : Quit on x or X	
<code>\@savemarbox</code> : (DPC) Extra group for		just like a real error	276
colour	692	1994-03-15 ltfmtcmd.dtx v3.2a	
<code>\@xympar</code> : (DPC) Extra bgroup for		General: Adapted to mass formatting	489
colour	693	Changed <code>\/</code> to <code>\@italiccorr</code>	489
1994-03-12 ltplain.dtx v1.0b		Removed <code>\@renewfontswitch</code>	489
General: Name changed from lplain.		Removed defs of short-forms and all	
The end of an era	14	sizes except <code>\normalize</code>	489
1994-03-12 ltplain.dtx v1.0e		1994-03-15 ltoutput.dtx v1.0l	
General: Replaced remaining width,		<code>\@addtocurcol</code> : Changed <code>\addvspace</code>	
height, depth by \LaTeX macro		to <code>\vskip</code>	852, 856
names to save tokens.	14	<code>\@combinedblfloats</code> : Removed	
1994-03-13 ltcntrl.dtx v1.0c		boxmaxdepth setting.	843
<code>\@tfor</code> : (DPC) Add <code>\@tf@r</code> so a single		<code>\@makecol</code> : <code>\maxdepth</code> changed to	
group is correctly treated.	227	<code>\@maxdepth</code>	835
1994-03-13 ltfilehook.dtx v0.3b		Removed boxmaxdepth setting.	835
<code>\unqu@tefilef@und</code> : Use new cmd		<code>\@makespecialcolbox</code> : Removed	
<code>\@addtofilelist</code>	772	boxmaxdepth setting.	837
1994-03-13 ltfiles.dtx LaTeX2e		<code>\@topnewpage</code> : Corrected and	
<code>\@addtofilelist</code> : Macro added	278	amended warning message	827
		Warning added: it should be	
		improved	828

General: Added some warnings when page gets full of top floats.	811	1994-03-29 ltcounts.dtx v1.0c	General: Create file from parts of ltmiscen and ltherest.	326
Driver added and further tidying.	811	1994-03-29 ltlength.dtx v1.0c	General: Create file ltcntlen from parts of ltmiscen and ltherest.	334
Removed duplicated code and corrected docstrip options.	811	1994-03-29 ltmiscen.dtx v1.0d	General: Remove counter macros to ltcntlen	537
Some boxmaxdepth settings removed.	811	1994-03-29 ltpageno.dtx v1.0c	General: Create file ltcntlen from parts of ltmiscen and ltherest.	531
1994-03-16 ltclass.dtx v0.3f		1994-03-29 ltxref.dtx v1.0c	General: Create file ltcntlen from parts of ltmiscen and ltherest.	532
General: Add pkgindoc package . . .	761	1994-03-31 ltbibl.dtx v1.0a	General: Initial version of ltidxbib.dtx, split from ltherest.dtx	705
1994-03-16 ltfiles.dtx LaTeX2e		1994-03-31 ltidxglo.dtx v1.0a	General: Initial version of ltidxbib.dtx, split from ltherest.dtx	702
\listfiles: Move this code directly into \document	279	1994-04-09 ltcounts.dtx v1.0d	\@newctr: \@nocnterr now has counter name argument	327
1994-03-16 ltfiles.dtx v1.0c			\addtocounter: \@nocnterr now has counter name argument	327
\document: (DPC) directly add file list settings	264		\setcounter: \@nocnterr now has counter name argument	327
1994-03-16 ltmiscen.dtx v1.0b			\stepcounter: Use \addtocounter to have name checked	328
\@verbatim: Remove		1994-04-09 ltthm.dtx v1.0b	\@othm: Use standard counter error message (FMi)	664
\global\@inlabelfalse again. . .	552	1994-04-11 ltclass.dtx v0.3g	\endfilecontents: Add star form, don't write \endinput at the end of the file.	745
1994-03-28 ltalloc.dtx v1.0d			\ProvidesFile: Protect against weird catcodes.	727

<code>\@footnotetext</code> : (DPC) Remove Colour support	698	<code>\not@math@alphabet</code> : Message changed again	459
<code>\@savemarbox</code> : (DPC) Remove Colour support	692	1994-04-23 ltfinal.dtx v0.1d	
1994-04-18 ltssbas.dtx v2.1i		General: Check that <code>\font@submax</code> is still zero	886
General: Macro <code>\no@alphabet@help</code> removed again	336	1994-04-24 ltoutput.dtx v1.0m	
<code>\calculate@math@sizes</code> : Changed message to log only	358	<code>\@resetfps</code> : Number 2 changed to <code>\tw@</code>	873
<code>\no@alphabet@error</code> : Use std LaTeX error macro	336	Warning changed	873
1994-04-18 ltssdcl.dtx ???		<code>\@specialoutput</code> : Message changed to give more info and ‘top’ removed	829
<code>\DeclareMathAlphabet</code> : Pass correct arg (2 not 3)	426	<code>\@topnewpage</code> : Message changed to give more info	828
1994-04-18 ltssdcl.dtx v2.1d		Warning message removed as it will be generated later	827
General: Removed surplus <code>\no@alphabet@error</code> (see fam.dtx)	414	General: Changed <code>\@normalsize</code> to <code>\normalsize</code> .	811
1994-04-18 ltssstrc.dtx v2.3d		Corrected unverbbed commands in documentation.	811
General: Changed to new error/warning scheme	384	Removed some long lines and other aesthetic changes.	811
<code>\font@submax</code> : Changed dimen to macro	403	Warning messages changed/corrected.	811
		1994-04-24 ltpictur.dtx v0.1b	
		General: Removed surplus spaces after <code>\hbox</code> to in several cases	630

1994-04-25 ltclass.dtx v0.3h	Warning changed to info message in
General: Removed spurious extra 's at	<code>\@protecteddef</code> 489
the end of error messages 718	1994-04-30 ltoutput.dtx v1.0n
1994-04-25 ltfloat.dtx v1.0e	<code>\@activechar@info</code> :
<code>\@largefloatcheck</code> : Changed warning	<code>\@activechar@warning</code> changed to
message to give more info 688	<code>\@activechar@info</code> 838
Command added 688	<code>\@combinedblfloats</code> : Removed rule in
General: Changed warning messages 679	topnewpage case 843
Removed obsolete tracing code . . 679	<code>\@emptycol</code> : Empty column action
1994-04-27 ltfstrc.dtx v2.3e	added: <code>\@emptycol</code> 826
General: Corrected item that was	<code>\@flsetnum</code> : Rogue space removed . 873
forgotten in last change. 384	<code>\@specialoutput</code> : Cut-off point
1994-04-28 lterror.dtx v1.0j	changed to <code>2\baselineskip</code> . . . 829
<code>\@inmatherr</code> : Macro added 236	Empty column action added:
1994-04-28 lterror.dtx v1.1c	<code>\@emptycol</code> 829
<code>\@inmatherr</code> : Replaced <code>\noexpand</code>	Extra empty column added for
with <code>\protect</code> 236	twocolumn case 829
1994-04-28 ltssdcl.dtx v2.1e	Extra empty column added for
General: Removed all <code>\uppercase</code> in	twocolumn case (wrong, see
hex num parsing macros 414	below) 829
1994-04-28 ltlists.dtx v1.0c	<code>\@topnewpage</code> : Added setting of
<code>\item</code> : Replaced <code>\@ltxnomath</code> by	<code>\col@number</code> 826, 827
<code>\@inmatherr</code> 584	Cut-off point changed to
1994-04-28 ltpictur.dtx v0.1c	<code>3\baselineskip</code> 828
<code>\@multiput</code> : (DPC) Macro added . . 634	Empty column action added:
General: bezier curves added 657	<code>\@emptycol</code> 828
<code>\multiput</code> : (DPC) Ignore spaces	Message changed for Frank 828
between)(. 633	General: <code>\@activechar@warning</code>
<code>\picture</code> : (DPC) Ignore spaces before	changed to an info message. . . . 811
(. 632	Added <code>\col@number</code> 811
1994-04-28 ltplain.dtx v1.0g	Documentation tidied. 811
General: Turn off overfull box tracing	Empty column action added. . . . 811
in log 25	Fixed bug from <code>\dblfigrule</code> with
1994-04-29 ltclass.dtx v1.0a	<code>\@topnewpage</code> 811
General: Change version number to 1	Full of floats action improved. . . 811
(no other change) 718	<code>\col@number</code> : Added <code>\col@number</code> . 823
1994-04-29 ltmiscen.dtx v1.0f	<code>\onecolumn</code> : Added setting of
<code>\@verbatim</code> : <code>\leavevmode</code> added . . 553	<code>\col@number</code> 825
Change to <code>\everypar</code> added 553	1994-05-01 lterror.dtx v1.0k
1994-04-29 ltoutenc.dtx 1.4a	<code>\@latexerr</code> : (CAR) Added draft
General: Removed	<code>\@latexinfo</code> 233
<code>\EncodingSpecific</code> . Renamed all	1994-05-01 ltoutenc.dtx 1.4a
the commands. Added	General: Added the <code>\a</code> command. . . 292
<code>\DeclareTextGlyph</code> and	Added the <code>\SaveAtCatcode</code> and
<code>\UndeclareTextCommand</code> 284	<code>\RestoreAtCatcode</code> commands. . 296
Removed Rokicki's OT1 variant	Removed the uc/lc table settings,
encoding. Moved the driver to the	since the T1 uc/lc table is now the
top. 283	default. 304
1994-04-30 ltfntcmd.dtx v3.3b	Rewrote for the new syntax. . 296, 298
General: Documentation up-dated and	1994-05-01 ltoutenc.dtx v1.4a
tidied 489	General: Removed Rokicki's
Prefix <code>frag@</code> changed to <code>frag</code> in	encoding. 280
<code>\@protecteddef</code> 489	Renamed the commands, removed
Title changed 489	the <code>\EncodingSpecific</code> command.

Turned all slots into decimal.		1994-05-03 ltmiscen.dtx v1.0h	
Added <code>\a</code>	280	<code>\@centercr</code> : <code>\@badcrerr</code> replaced by	
1994-05-02 ltcntrl.dtx v1.0l		<code>\@nolnerr</code>	549

\@writetsetup: \normalcoloradded 838	1994-05-13 ltfntcmd.dtx v3.3g
General: \normalcoloradded in	General: Replaced \@protecteddef by
various places (DPC).	\DeclareRobustCommand 489
1994-05-13 ltboxes.dtx v1.0h	1994-05-13 ltfssbas.dtx v2.1k
\@arrayparboxrestore: New accent	General: Remove File identification
system, use \let not \def	‘typeout’ 336
1994-05-13 ltcounts.dtx v1.0f	1994-05-13 ltfssbas.dtx v2.1l
General: Removed \@lalph 330	\DeclareFontEncoding: Init encoding
Removed \@ialph 330	change command 340
1994-05-13 ltdefns.dtx v1.0q	\define@newfont: Use \@input@ for fd
General: (ASAJ) Renamed	files 349
\DeclareProtectedCommand to	1994-05-13 ltfssdcl.dtx v2.1h
\DeclareRobustCommand.	General: Removed file identification
Removed \@if@short@command.	typeout 414
(ASAJ) Replaces \space by ‘ ’ in	1994-05-13 ltfssini.dtx v2.1j
\csname. 69	General: Removed file identification
Renamed	typeout 441
\DeclareProtectedCommand to	1994-05-13 ltfssstrc.dtx v2.3g
\DeclareRobustCommand.	General: Removed typeouts as
Removed \@if@short@command.	\ProvidesPackage writes to log. 384
Moved to after the definition of	1994-05-13 ltoutenc.dtx v1.5b
\@gobble. 78	General: Added \{, \} and \\$. 280
1994-05-13 ltdefns.dtx v1.0r	Renamed
General: (ASAJ) Added logging	\DeclareProtectedCommand to
message to	\DeclareRobustCommand. 280
\DeclareProtectedCommand.	Replaces \space by ‘ ’ in \csname. 280
Added logging message to	1994-05-13 ltpictur.dtx v0.1d
\DeclareProtectedCommand.	General: Removed surplus braces from
1994-05-13 ltdefns.dtx v1.0s	\@if.. constructions 630
General: (ASAJ) Added	1994-05-13 lttab.dtx v1.0d
\@backslashchar. 69	\@contfield: Colour support 611
(ASAJ) Coded \@ifdefinable more	\@startfield: Colour support 611
efficiently. 69	\@stopfield: Colour support 611
Coded more efficiently, thanks to	\@a: moved to ltoutenc 609
FMi. 75	1994-05-14 fontdef.dtx v2.1f
1994-05-13 ltfiles.dtx LaTeX2e	General: Removed .def files. 467
\listfiles: Stop \listfiles being	1994-05-14 ltfssbas.dtx v2.1m
run twice 278	\enc@update: Macro added 345
1994-05-13 ltfiles.dtx v1.0g	1994-05-14 ltfssbas.dtx v2.1n
\document: Added execution of	General: Set defaults for all \f@... 346
\every@size 263	\DeclareErrorFont: Don’t set
1994-05-13 ltfinal.dtx v0.1h	\@f@encoding 353
General: Added package otlenc, and	\DeclareFontEncoding: Log if
defined \@acci, \@accii and	encoding is redeclared 340
\@acciii. 886	Only init enc change cmd when new
1994-05-13 ltfinal.dtx v1.0h	encoding 340
General: Added output enc stuff 899	

- 1994-05-14 ltffssini.dtx v2.1k
 General: Init error font just before
 checking for fontdef.cfg 462
`\reset@font`: Remove surplus braces 461
- 1994-05-14 ltffsstrc.dtx v2.3h
`\selectfont`: Added `\enc@update` . 389
- 1994-05-14 ltoutenc.dtx 1.5d
 General: Moved the driver to the top. 283
- 1994-05-14 ltoutenc.dtx v1.5c
 General: Added the fontenc package 322
 Added the fontenc package. 280
 Fixed a bug which caused an
 infinite loop if `\f@encoding` was
 incorrectly set. 280, 284
 Moved fontsmpl to its own dtx file. 280
- 1994-05-14 ltoutenc.dtx v1.5d
 General: Rewrote
`\DeclareTextCommand` to define its
 argument to use the current
 encoding by default, rather than
 the encoding provided to
`\DeclareTextCommand`. . . . 280, 284
 Tidied up the documentation. . . . 280
- 1994-05-14 ltoutenc.dtx v1.5e
 General: Replaced `\ENC@cmd` by
`\ENC-cmd`. 280
- 1994-05-15 ltffsbas.dtx v2.1o
 General: encoding cmds changed to
 enc-cmd 336
- 1994-05-16 fontdef.dtx v2.1g
 General: Removed
`\DeclareFontEncoding` for ot1 and
 t1 and input .def files instead . . 467
- 1994-05-16 ltalloc.dtx v1.1a
 General: (ASAJ) Split from ltinit.dtx. 222
- 1994-05-16 ltcntrl.dtx v1.0a
 General: (ASAJ) Split from ltinit.dtx. 224
- 1994-05-16 ltdefns.dtx v1.1a
 General: (ASAJ) Split from ltinit.dtx. 69
- 1994-05-16 lterror.dtx v1.1a
 General: (ASAJ) Completely new
 error interface. 228
 (ASAJ) Split from ltinit.dtx. . . . 228
- 1994-05-16 ltfinal.dtx v1.0i
 General: moved output enc stuff to
 lfonts 899
- 1994-05-16 ltffsbas.dtx v2.1p
`\fontsize`: Pass `\baselinestretch` not
`\f@linespread` 346
`\linespread`: Remove surplus braces 346
- 1994-05-16 ltffssini.dtx v2.1m
`\@acciii`: Define saved versions of
 accents 463
- 1994-05-16 ltlogos.dtx v1.1a
 General: (ASAJ) Split from ltinit.dtx. 259
- 1994-05-16 ltmath.dtx v1.0k
`\ensuremath`: Use
`\DeclareRobustCommand` and add
 extra braces in math mode 569
- 1994-05-16 ltoutenc.dtx 1.5h
 General: `\pounds` was still using u
 rather than ui shape. 296
- 1994-05-16 ltoutenc.dtx v1.5f
 General: enc files now have uc
 encoding name parts (FMi) 280
 Revert code so that the encoding
 given is used in
`\DeclareTextCommand` (FMi) . . . 280
- 1994-05-16 ltoutenc.dtx v1.5g
 General: Made fontenc.sty use the new
 mixed-case encoding files. 280
 Removed the lowercasing of the
 filename. 322
- 1994-05-16 ltoutenc.dtx v1.5h
 General: Added `\NG`, `\ng`, `\TH`, `\th`,
`\DH`, `\dh`, `\DJ` and `\dj`. 280
 Added `\r` (ring accent) and `\k`
 (ogonek) accents. 280
 Fixed a bug with `\pounds`. 280
 Removed `\P` from the OT1
 definitions file. 280
- 1994-05-16 ltoutenc.dtx v1.5i
 General: Fixed a bug with `\d`. . . . 280
- 1994-05-16 ltoutput.dtx v1.0q
`\@writsetup`: Changed setting of
 accents (FMi): with the new
 encoding setup they can use `\let`.
 It could also use the new internal
 commands? 839
 General: Changed setting of accents
 (FMi). 811
- 1994-05-16 ltpar.dtx v1.1a
 General: (ASAJ) Split from ltinit.dtx. 238
- 1994-05-16 ltplain.dtx v1.0h
 General: Comment out encoding
 specific commands 29
 Remove `\@acci` and friends again . 30
 Remove unnecessary def for `\item` 29
`\loop`: Use Kabelschacht method . . . 28
`\m@th`: Remove unnecessary space . . . 29
- 1994-05-16 ltspac.dtx v1.1a
 General: (ASAJ) Split from ltinit.dtx. 240
- 1994-05-17 ltclass.dtx v1.0e
`\@use@option`: Execute option after
 removing from list, not before . . 731

1994-05-17 ltdefs.dtx 1.1b	1994-05-19 ltcounts.dtx v1.1a
General: (ASAJ) Added the	General: Extracted file from ltcntlen. 326
<code>\@protect@...</code> commands. 79	1994-05-19 ltdefs.dtx v1.1d
1994-05-17 ltdefs.dtx v1.1b	General: (RmS) Added definitions for
General: (ASAJ) Added definitions for	<code>\@namedef</code> and <code>\@nameuse</code> again. . 69
<code>protect.</code> 69	1994-05-19 ltfinal.dtx v0.1k
(ASAJ) Removed warnings and	General: Removed <code>\makeat...</code> 886
logging to lterror.dtx. 69	1994-05-19 ltidxglo.dtx v1.1a
Added the discussion of protected	General: Initial version of ltidxglo.dtx,
commands, defined the values that	split from ltidxbib.dtx 702
<code>\protect</code> should have. 79	1994-05-19 ltlength.dtx v1.1a
1994-05-17 ltdefs.dtx v1.1c	General: Extract file ltlength from
General: (ASAJ) Redid definitions for	ltcntlen. 334
<code>protect.</code> 69	1994-05-19 ltpageno.dtx v1.1a
1994-05-17 lterror.dtx v1.1b	General: Extract file ltpageno from
General: (ASAJ) Moved error stuff	ltcntlen. 531
from ltdefs.dtx. 228	1994-05-19 ltplain.dtx v0.1k ltfinal
1994-05-17 ltssini.dtx v2.1n	<code>\showoutput</code> : used <code>\maxdimen</code> not
<code>\copyright</code> : Really add extra braces 461	99999 31
<code>\nfss@text</code> : Added braces to allow	<code>\showoverfull</code> : used <code>\@one</code> not 1 31
use in subscripts 461	1994-05-19 ltxref.dtx v1.1a
1994-05-17 ltmath.dtx v1.0i	General: Extract file ltxref from
General: Replaced <code>\let</code> by <code>\gdef</code> , for	ltcntlen. 532
indirect definition. 565	1994-05-20 ltdefs.dtx v1.1e
1994-05-17 ltoutenc.dtx v1.5j	General: Changed command name
General: Added braces to <code>\pounds</code> so	from <code>\@checkcommand</code> to
it works as a subscript. 280	<code>\CheckCommand.</code> 69
1994-05-18 ltdefs.dtx 1.1c	<code>\CheckCommand</code> : Changed name from
General: (ASAJ) Renamed the	<code>\@checkcommand</code> to
commands, and removed one	<code>\CheckCommand.</code> 77
which is no longer needed. 79	1994-05-20 lterror.dtx v1.1c
1994-05-18 ltdefs.dtx v1.1c	General: (ASAJ) Added
General: Redid the discussion and	<code>\@latex@info@no@line.</code> 228
definitions, in line with the	(ASAJ) Added missing full stops. 228
proposed new setting of <code>\protect</code>	(ASAJ) Fixed a bug with
in the output routine. 79	<code>\@inmatherr.</code> 228
1994-05-18 ltfinal.dtx v0.1j	1994-05-20 ltfinal.dtx v0.1l
General: Corrected the lcode for	General: Use new font warning
<code>d-bar.</code> 886	commands 892
1994-05-18 ltlogos.dtx v1.1b	1994-05-20 ltfloat.dtx v1.0h
General: (ASAJ) Added the \TeX	<code>\@endfloatbox</code> : Restore outer value of
logo. 259	<code>@nobreak</code> switch. 688
(ASAJ) Made the $\LaTeX 2_{\epsilon}$ logo use	<code>\outer@nobreak</code> : Macro added:
the text font ‘2’ rather than the	default is to do nothing. 688
math font ‘2’. 259	1994-05-20 ltfntcmd.dtx v3.3h
1994-05-18 ltoutenc.dtx v1.5k	General: Use new error commands . 489
General: Made dotted-i produce ‘i’. . 280	1994-05-20 ltssbas.dtx v2.1q
Removed braces from <code>\pounds</code> and	General: Use new error commands . 336
<code>\dollar.</code> 280	1994-05-20 ltfssstrc.dtx v2.3i
Replaced <code>\defaultencoding</code> with	General: Use new error command
<code>\encodingdefault.</code> 280	names 384
1994-05-19 ltbibl.dtx v1.1a	1994-05-20 ltmiscen.dtx v1.0l
General: Initial version of ltbibl.dtx,	<code>\@writefile</code> : Added correct setting of
split from ltidxbib.dtx 705	<code>\protect.</code> 543

1994-05-20 ltmiscen.dtx v1.0m			
General: Use new warning commands	537	<code>\GenericError</code> , <code>\GenericWarning</code>	
1994-05-20 ltoutput.dtx v1.0s		and <code>\GenericInfo</code> .	228
<code>\writsetup</code> : Added setting of		(ASAJ) Replaces <code>\string</code> by	
<code>\protect</code> during <code>\shipout</code> .	838	<code>\protect</code> in some messages.	228
General: Added setting of <code>\protect</code>		1994-05-22 lterror.dtx v1.2d	
during <code>\shipout</code> .	811	<code>\GenericError</code> : (DPC) Alternative	
1994-05-20 ltpage.dtx v1.0d		version added for old TeXs	229
<code>\markright</code> : Changed setting for		(DPC) New version using long	
<code>\protect</code> .	711	command name.	229
1994-05-20 ltsect.dtx v1.0c		1994-05-22 ltfloat.dtx v1.0i	
General: Correct setting of <code>\protect</code> .	676	General: Use new warning commands	679
<code>\addcontentsline</code> : Correct setting of		1994-05-22 ltoutput.dtx v1.0t	
<code>\protect</code> .	675	General: Changed warnings and infos	
1994-05-21 ltbibl.dtx v1.1b		to new commands.	811
General: Use new warning commands	705	1994-05-22 ltpictur.dtx v0.1e	
1994-05-21 lterror.dtx v1.1d		General: Use new warning cmds	630
General: (ASAJ) Made the error		1994-05-23 ltclass.dtx v1.0h	
commands robust.	228	<code>\NeedsTeXFormat</code> : Don't stop	
1994-05-21 ltfiles.dtx v1.0h		completely when format is wrong	734
General: Use new error commands	260	<code>\usepackage</code> : Remove argument if	
1994-05-21 ltlists.dtx v1.0f		possible	734
General: Use new error commands	573	1994-05-23 ltdirchk.dtx v1.0f	
1994-05-21 ltmiscen.dtx v1.0n		General: Document <code>\@TeXversion</code>	1
General: Use new error commands	537	1994-05-23 ltfsstrc.dtx v2.3j	
1994-05-21 ltsect.dtx v1.0d		General: Removed def of	
General: Use new error commands	666	<code>\f@warn@break</code>	402
1994-05-21 lttab.dtx v1.0f		1994-05-23 ltoutput.dtx v1.0u	
General: Use new error commands	605	<code>\activechar@info</code> : Added	
1994-05-21 ltxref.dtx v1.1b		<code>\MessageBreak</code>	838
General: Use new warning commands	532	<code>\writsetup</code> : Changed resetting of	
<code>\newlabel</code> : Use new warning		<code>\protect</code> after shipout to use	
commands	534	<code>\aftergroup</code>	838
1994-05-22 ltclass.dtx v1.0f		General: Added <code>\MessageBreak</code> .	811
General: Use new warning and error		Changed resetting of <code>\protect</code> after	
commands	714	shipout.	811
1994-05-22 ltdefns.dtx v1.1f		1994-05-24 lterror.dtx v1.2e

cmds	69	1994-05-24 lterror.dtx v1.2f	
1994-05-22 lterror.dtx v1.1e		General: (DPC) wrap long lines	228
General: (ASAJ) Replaced bgroup by		1994-05-24 ltfnctcmd.dtx v3.3i	
begingroup in error messages, to		General: Tidying and typos fixed	489
stop extra mathords creeping into		1994-05-24 ltmiscen.dtx v1.0q	
math mode.	228	<code>\@currnvlne</code> : Use <code>\@empty</code> as outer	
1994-05-22 lterror.dtx v1.2a		default	548
General: (ASAJ) Made		1994-05-25 ltdirchk.dtx v1.0g	
<code>\GenericError</code> , <code>\GenericWarning</code>		<code>\filename@parse</code> : Mac parser had "	
and <code>\GenericInfo</code> robust.	228	typo for :	12
(ASAJ) Replaced <code>\</code> and tilde by		1994-05-25 ltfnctcmd.dtx v3.3j	
<code>\MessageBreak</code> and <code>\space</code> .	228	General: Insertion of <code>\aftergroups</code> to	
(ASAJ) Replaced		implement <code>\nocorr</code> moved to the	
<code>\@generic@message</code> and		end of the group	489
<code>\@generic@error</code> by		<code>\check@icr</code> : Macros added	493

<code>\check@nocorr@</code> : Insertion of	1994-06-08 ltfinal.dtx v1.0m
<code>\aftergroups</code> moved and defaults	General: Add patch file system 899
set up for efficiency 493	1994-06-09 ltfinal.dtx v1.0n
<code>\DeclareTextFontCommand</code> :	General: For \TeX 2, do not set codes
<code>\expandafter</code> inserted 491	for higher half of character
Insertion of <code>\aftergroups</code> moved 491	table. 890, 897
1994-05-25 ltoutput.dtx v1.0v	1994-06-09 ltfntcmd.dtx v3.3k
General: Extra documentation. 811	General: Tidying and typos fixed in
1994-05-25 ltsect.dtx v1.0e	documentation 489
<code>\@dottedtocline</code> : Put braces around	1994-06-18 ltfntcmd.dtx v3.3l
argument 4 (the actual toc entry)	General: Added check for empty text . 489
to avoid font (and possibly other)	<code>\check@nocorr@</code> : Added check for
changes leaking out to the leaders. . 677	empty text 493
1994-05-25 ltthm.dtx v1.0c	1994-06-22 ltfntcmd.dtx v3.3m
General: Modify documentation . . . 662	General: Removed space from
1994-05-25 ltvers.dtx v1.0d	<code>\nfss@text</code> 489
General: Remove PRELIMINARY	Renamed <code>\check@nocorr</code> 489
TEST RELEASE from startup	<code>\check@nocorr@</code> : Renamed
banner (spring is here) 34	<code>\check@nocorr</code> to <code>\text@command</code>
1994-05-25 ltxref.dtx v1.1c	to improve <code>\long</code> error message . 493
General: Modify documentation . . . 532	<code>\DeclareTextFontCommand</code> : Removed
1994-05-26 ltfiles.dtx LaTeX2e	space from <code>\nfss@text</code> 491
<code>\@missingfileerror</code> : Modify message	1994-06-22 ltmath.dtx v1.2t classes
format 276	<code>\mathindent</code> : Set <code>\mathindent</code> at the
1994-05-26 ltlogos.dtx v1.1c	end of the class instead of at begin
General: Remove <code>\SLiTeX</code> logo 259	document 570
1994-05-26 ltmiscen.dtx v1.0r	1994-07-20 ltlogos.dtx v1.1e
General: <code>\literal</code> removed 557	<code>\LaTeX</code> : Save a few tokens 259
1994-05-26 ltplain.dtx v1.1m	<code>\LaTeXe</code> : Save a few tokens 259
<code>\iterate</code> : (CAR) added <code>\long</code> 28	1994-07-20 ltpage.dtx v1.0h
<code>\underbar</code> : (CAR/FMi) changed to	<code>\sloppy</code> : Save a few tokens 712
use box <code>\tw@</code> 29	1994-09-16 ltfsbas.dtx v2.1s
1994-05-26 ltplain.dtx v1.1p	<code>\nfss@catcodes</code> : Reset [and] as well,
<code>\underbar</code> : (DPC) changed to use	just in case 350
<code>\sbox</code> 29	1994-10-07 ltoutenc.dtx v1.5l
1994-05-29 ltssdcl.dtx v2.1j	General: Moved the ogonek accent. . 280
General: Use new error commands . . 414	1994-10-11 ltdirchk.dtx v1.0h
1994-05-31 ltfinal.dtx v1.0n	<code>\@TeXversion</code> : Check for TeX3.14 . . 13
General: Renamed <code>lthyphen.*</code> to	General: Modify all of <code>ltxcheck</code> again . 13
<code>lthyphen.*</code> 886	1994-10-12 ltsect.dtx v1.0f
1994-06-01 ltboxes.dtx v1.0i	General: Doc. typos 666
<code>\@frameb@x</code> : Macro added. 596	1994-10-14 fontdef.dtx v2.2a
<code>\@ifframebox</code> : New version, so <code>\width</code>	General: New coding 465
is correct in <code>\framebox</code> 596	1994-10-14 ltssini.dtx v2.2a
<code>\fbox</code> : New version, using	General: New coding for cfg files . . 441
<code>\@frameb@x</code> 595	1994-10-14 ltmiscen.dtx v1.0s
<code>\framebox</code> : New version, so <code>\width</code> is	General: Move math to other file . . 537
correct in <code>\framebox</code> 596	1994-10-14 ltplain.dtx v1.1a
1994-06-01 ltlogos.dtx v1.1d	General: Moved code to other files. . . 14
<code>\LaTeX</code> : Add <code>\m@th</code> to force math size	1994-10-15 ltfsbas.dtx v2.1t
calculations 259	<code>\extract@alph@from@version</code> : Warn
1994-06-01 ltoutput.dtx v1.0w	if math alpha is used outside
General: Tidied up typesetting. . . . 811	math 358

1994-10-18 ltboxes.dtx v1.0j	1994-10-25 ltdefs.dtx v1.2b
\@frameb@x: \leavevmode added . . . 596	General: Documentation
\@ifframebox: \leavevmode moved to	improvements 69
\@frameb@x 596	1994-10-25 ltoutenc.dtx 1.6a
\@parboxto: Macro added to remove	General: Added \textdollar,
misuse of \@empty 598	\textlbrace, \textrbrace,
General: stuff from ltpatch done . . . 590	\textsterling, \textunderline. 298
\fbbox: \long added 595	Removed \textlbrace,
\mbbox: \long added 591	\textrbrace, \textunderline to
\sbox: \long added 594	give them their proper names. . . 298
1994-10-18 ltclass.dtx v1.0j	1994-10-25 ltoutenc.dtx v1.6a
General: Move \listfiles to	General: Added
ltfiles.dtx 714	\ProvideTextCommand,
1994-10-18 ltdefs.dtx v1.2a	\UseTextSymbol, \UseTextAccent,
\@star@or@long: macro added 72	\DeclareTextSymbolDefault,
General: Add extra test for \endgraf 69	\DeclareTextAccentDefault,
Add star-forms for all commands . 69	\DeclareTextCommandDefault,
\renew@environment: reset end	and
command 76	\ProvideTextCommandDefault. . . 280
1994-10-18 ltfiles.dtx v1.0i	Added the \Provide commands,
\listfiles: code moved here from	and the default definitions. 284
ltclass 278	Added the defaults. 292
1994-10-18 ltoutenc.dtx v1.5l	Added the files OTlenc.def,
General: Added new definitions of	Tlenc.def and OMSenc.def. 292
\patterns and \hyphenation. . . 292	Added the OMS encoding. 304
1994-10-18 ltoutenc.dtx v1.5m	1994-10-27 ltoutenc.dtx 1.6b
General: Added new definitions of	General: Added \textasciicircum
\patterns and \hyphenation. . . 280	\textasciitilde \textbackslash
1994-10-18 ltsect.dtx v1.0g	\textbar \textbraceleft
\@dottedtocline: Added	\textbraceright
\normalcolor for page number . . 677	\textcompwordmark \textemdash
General: Added \normalcolor 666	\textendash \textexclamdown
1994-10-19 ltfssbas.dtx v2.1t	\textgreater \texthyphenchar
\DeclareFontEncoding: Add missing	\texthyphen \textless
\relax. 340	\textquestiondown
1994-10-23 ltfssstrc.dtx v23.k	\textquotedblleft
\every@math@size: Renamed to	\textquotedblright
\every@math@size 393	\textquotedbl \textquoteleft
1994-10-23 ltmath.dtx v1.0l	\textquoteright
\@eqnnum: Added \normalcolor since	\textunderscore
\eqno introduces a subgroup of the	\textvisiblespace 298
displayed math group 567	Added: \textemdash \textendash
\ensuremath: Remove extra braces:	\textexclamdown
but see p 168 of Leslie's book . . 569	\texthyphenchar \texthyphen
1994-10-24 ltboxes.dtx v1.0k	\textquestiondown
\fbbox: Inner braces added (to fix	\textquotedblleft
latex/1061) 595	\textquotedblright
1994-10-25 fontdef.dtx v2.2c	\textquoteleft
General: Added OMSenc.def 467	\textquoteright 296
1994-10-25 ltboxes.dtx v1.0l	1994-10-27 ltoutenc.dtx v1.5d
\@isavepicbox: missing percent	General: Rewrote
(moved from ltpatch) 594	\DeclareTextSymbol to define its
	argument to use the current

encoding by default, to fit with <code>\DeclareTextCommand</code>	284	Rewrote <code>\copyright</code> to use <code>\textcircled</code>	294
1994-10-27 ltoutenc.dtx v1.6b		1994-10-31 fontdef.dtx v2.2d	
General: Added <code>\textbackslash</code> . . .	304	General: Added OMLenc.def	467
Added more defaults for OT1. . .	292	1994-10-31 fontdef.dtx v2.2e	
Removed the enc.def files	280	General: ... and moved further down	467
Removed the files OT1enc.def, T1enc.def and OMSenc.def.	292	1994-10-31 ltfloat.dtx v1.1a	
Renamed <code>\textlbrace</code> to <code>\textbraceleft</code> and <code>\textrbrace</code> to <code>\textbraceright</code>	304	<code>\dblfloat</code> : Major changes since two-column and one-column cases merged	682
1994-10-29 ltmath.dtx 1.0m		<code>\dblfloatset</code> : Macro added	682
General: ASAJ: Added <code>\DeclareMathOperator</code>	558	Major changes to parameter parsing, setting of local variables, etc; two-column and one-column cases merged; space hacks moved	682
ASAJ: Tidied up documentation.	565	<code>\endfloatbox</code> : (DPC/CAR) Extra box added to remove colour resetting from vmode	688
1994-10-29 ltmath.dtx v1.0m		<code>\floatboxreset</code> : Macro added . . .	686
General: ASAJ: Added <code>\mathellipsis</code> , <code>\mathdollar</code> and <code>\mathsterling</code>	565	<code>\footnotetext</code> : (DPC/CAR) Move colour setting to output routine .	698
ASAJ: Removed <code>\dag</code> , <code>\ddag</code>	565	<code>\savemarbox</code> : (DPC/CAR) Extra box added for colour	692
ASAJ: Renamed <code>\S</code> and <code>\P</code> to <code>\mathsection</code> and <code>\mathparagraph</code> and made them <code>\mathchardefs</code>	565	<code>\setfps</code> : Macro added	683
1994-10-29 ltoutenc.dtx v1.6c		<code>\xdblfloat</code> : Macros removed: <code>\dbflt</code> , <code>\xdblfloat</code>	688
General: Added commands like <code>\dots</code> for use in text and math.	292	<code>\xfloat</code> : (DPC/CAR) Extra box added to remove colour resetting from vmode	684
Renamed <code>\P</code> , <code>\S</code> , <code>\dag</code> and <code>\ddag</code> to <code>\textparagraph</code> , <code>\textsection</code> , <code>\textdagger</code> and <code>\textdaggerdbl</code>	280	Major changes, removing setting of local variables, space hacks etc; two-column and one-column cases merged	683
1994-10-30 ltdefs.dtx v1.2c		Reset hook added	684
<code>\@onelevel@sanitize</code> : Macro added .	95	<code>\xympar</code> : (DPC/CAR) Extra box added since needed for floats . . .	693
General: (CAR) <code>\@onelevel@sanitize</code> added	69	<code>\fps@dbl</code> : Macro added	683
1994-10-30 ltdefs.dtx v1.2f		1994-10-31 ltoutput.dtx v1.1a	
General: (DPC) <code>\newwrite</code> 's moved to ltfiles	69	<code>\makecol</code> : (DPC/CAR) Colour resetting moved to here	835
1994-10-30 ltmath.dtx v1.0n		<code>\topnewpage</code> : (DPC/CAR) Extra box added to remove colour resetting from vmode	827
General: ASAJ: Moved the new commands to ltoutenc.	565	(DPC/CAR) Use <code>\color@begingroup</code> for colour . .	827
1994-10-30 ltoutenc.dtx v1.6d		(DPC/CAR) Use <code>\normalcolor</code> .	827
General: Added <code>\DeclareTextCompositeCommand</code>	280	1994-11-02 ltoutenc.dtx v1.6d	
Added <code>\textcircled</code>	280, 294, 304	General: Wrapped lines longer than 70 characters.	280
Added <code>\t</code>	294	1994-11-03 ltclass.dtx v1.0k	
Added math commands.	280	General: Move <code>\@missingfileerror</code> to ltfiles	718
Added OML encoding.	280, 294		
Added the OML encoding.	305		
Made <code>\textless</code> and <code>\textgreater</code> come from OML.	294		
Moved math commands here from ltmath.	296		
Removed <code>\textregistered</code>	294		

1994-11-03 ltdirchk.dtx v1.0i	1994-11-04 ltsect.dtx 1.0h
General: Generate an error if latex.ltx not used with clean initex 1	\@sect: (ASAJ) Added \protected@edef. 670
1994-11-03 ltfiles.dtx v1.0j	General: (ASAJ) Added \protected@xdef to \thanks. . . 666
\@missingfileerror: Move here from ltclass 276	1994-11-04 ltsect.dtx v1.0h
1994-11-04 ltboxes.dtx v1.0m	General: Added \protected@write to \addtocontents. ASAJ. 676

<code>\sqrt</code>	560	usage	384
1995-05-21 <code>ltoutenc.dtx</code> v1.7h		1995-05-25 <code>ltclass.dtx</code> v1.0p	
<code>\@inmathwarn</code> : Added several		<code>\endfilecontents</code> : Delete	
<code>\@onlypreamble</code>	284	<code>\filecontents</code> after preamble	745
1995-05-21 <code>ltoutenc.dtx</code> v1.7j		1995-05-25 <code>ltfilehook.dtx</code> v1.0t	
General: Updated some plain macros	296	<code>\unqu@tefilef@und</code> : (CAR) added	
1995-05-21 <code>ltplain.dtx</code> v1.1j		<code>\long</code>	772
General: Moved some code to other		1995-05-25 <code>ltfiles.dtx</code> v1.0s	
files	14	<code>\document</code> : Added check for <code>\topskip</code>	
1995-05-22 <code>ltplain.dtx</code> v1.1k		zero	264
General: Definitions of <code>\footins</code> and		1995-05-25 <code>ltfiles.dtx</code> v1.0t	
<code>\footnoterule</code> moved to <code>ltfloat</code>	31	<code>\@iffilenamepath</code> : (CAR) added <code>\long</code>	274
1995-05-22 <code>lttab.dtx</code> v1.1a		<code>\document</code> : Corrected typo	264
General: Support autoloading feature	605	<code>\IfFileExists@</code> : (CAR) added <code>\long</code>	273
1995-05-23 <code>ltfssini.dtx</code> v2.2e		<code>\nofiles</code> : (CAR) added <code>\long</code>	267
<code>\newfont</code> : Font assignment made local		<code>\protected@write</code> : (CAR) added	
again.	459	<code>\long</code>	268
1995-05-24 <code>ltdefns.dtx</code> v1.1l		1995-05-25 <code>ltfloat.dtx</code> v1.1m	
<code>\newif</code> : (DPC) New implementation	76	<code>\@savemarbox</code> : (CAR) Resettings	
1995-05-24 <code>ltdefns.dtx</code> v1.2m		moved to hook	692
<code>\typein</code> : (DPC) New implementation	71	<code>\@xfloat</code> : (CAR) Resettings moved to	
1995-05-24 <code>ltfloat.dtx</code> v1.1l		hook	684
<code>\@textsuperscript</code> : Command		1995-05-25 <code>ltlists.dtx</code> v1.0i	
added.	697	<code>\endtrivlist</code> : Macros moved from	
General: Moved definition of <code>\footins</code>		<code>ltspace.dtx</code>	582
and <code>\footnoterule</code> from <code>ltplain</code>	696		

1995-05-25 ltmath.dtx v1.3c classes		
<code>\@eqnnum</code> : replace		
<code>\reset@font\rmfamily</code> with		
<code>\normalfont</code> (PR 1578)	570	
1995-05-25 ltspac.dtx v1.2f		
<code>\@vbsphack</code> : (CAR) not used so		
‘removed’.	250	
<code>\@vspacer</code> : (CAR) <code>\@restorepar</code>		
added to avoid possible infinite tail		
recursion caused by a typo in the		
argument.	253	
(CAR) macros modified to be more		
efficient	253	
General: Macros moved to ltlists.dtx	240	
1995-05-26 ltdefns.dtx v1.2n		
<code>\@gobblefour</code> : (CAR) Added <code>\longs</code>	78	
1995-05-26 ltmath.dtx v1.0s		
<code>\@eqnnum</code> : Removed <code>\rmfamily</code> (PR		
1578), replaced <code>\reset@font</code> with		
<code>\normalfont</code>	567	
1995-05-26 ltpage.dtx v1.0g		
<code>\ps@plain</code> : removed <code>\rmfamily</code> (PR		
1578)	711	
1995-05-27 ltssbas.dtx v3.0b		
<code>\mathgroup</code> : (FMi) But a need to		
define <code>\new@mathgroup</code>	336	
1995-06-05 fontdef.dtx v2.2k		
General: Moved math commands from		
ltoutenc.dtx.	483	
1995-06-05 ltfinal.dtx v1.0r		
General: Added <code>\MakeUppercase</code> and		
<code>\MakeLowercase</code>	886	
1995-06-05 ltoutenc.dtx v1.7k		
<code>\inmathwarn</code> : Removed		
<code>\protected@cmd</code> and replaced with		
explicit <code>\noexpand</code>	284	
General: Allowed		
<code>\ProvideTextCommandDefault</code>		
after the preamble.	286	
Commented out <code>\textless</code> and		
<code>\textgreater</code>	294	
Moved math commands to		
fontdef.dtx.	296	
Save some tokens in		
<code>\textvisiblespace</code> and		
<code>\textunderscore</code>	294	
1995-06-06 ltfinal.dtx v1.0s		
General: Made <code>\MakeUppercase</code> and		
<code>\MakeLowercase</code> brace their		
argument.	886	
1995-06-09 ltoutenc.dtx v1.7l		
<code>\DeclareTextComposite</code> : Rewrote		
<code>\DeclareTextComposite</code> to define		
the composite as a no-argument		
command rather than a		
two-argument command.	287	
1995-06-11 ltspac.dtx v1.2g		
<code>\restorecr</code> : (CAR) <code>\relax</code> added to		
stop silent eating of *.	258	
1995-06-13 ltfinal.dtx v1.0t		
General: Add patch level string more		
carefully	899	
Call <code>\errorstopmode</code>	901	
1995-06-13 ltpictur.dtx v1.1b		
General: Use <code>\ProvidesFile</code> in		
autoload	630	
1995-06-14 lttab.dtx v1.1b		
General: Use <code>\ProvidesFile</code> in		
autoload	605	
1995-06-15 ltssbas.dtx v3.0c		
General: (DPC) minor documentation		
changes	336	
1995-06-15 ltsscmp.dtx v3.0b

1997-04-30 ltoutenc.dtx v1.9a	1997-10-06 ltcounts.dtx v1.1f
General: Changed <code>\textsc</code> to	<code>\@Roman</code> : Change <code>\@Roman</code> to be fully
<code>\scshape</code> 294	expandable, so that the result is
Introduced <code>\textcopyright</code> and	written properly to files. 331
modified <code>\copyright</code> 294	<code>\@slowromancap</code> : Macro added. 331
Introduced <code>\textcopyright</code> and	1997-10-08 ltlogos.dtx v1.1h
modify <code>\copyright</code> 295	<code>\LaTeX</code> : Simplify macro (force loading
Modified <code>\textunderscore</code> ,	of suitable math fonts once). 259
removing <code>\mathunderscore</code> 294	1997-10-10 ltclass.dtx v1.0y
Modified <code>\underscore</code> , removing	<code>\endfilecontents</code> : <code>\@currenvir</code> in
<code>\mathunderscore</code> 295	banner 747
1997-04-30 ltoutenc.dtx v1.9b	<code>\reserved@e</code> not <code>\verbatim@out</code> to
General: Added <code>\leavevmode</code> to	save a csname 746
<code>\textunderscore</code> 294	Check for text before or after <code>\end</code>
1997-05-04 ltoutenc.dtx v1.9c	environment. latex/2636 747
General: Added ‘hex index tabs’ 301	Use <code>\@gobbletwo</code> 746
Added TS1 encoding v2.2.beta 307	1997-10-17 ltfntcmd.dtx v3.3w
1997-05-07 ltoutenc.dtx v1.9d	<code>\check@nocorr@</code> : Check for vertical
General: Added <code>\leavevmode</code> to	mode moved here, from
<code>\textcompwordmark</code> 294	<code>\DeclareTextFontCommand</code> (see
1997-05-07 ltspace.dtx v1.2v	PR/2646). 493
<code>\newline</code> : Made completely robust. 245	<code>\DeclareTextFontCommand</code> :
1997-05-29 ltfsssrc.dtx v3.0j	Reinstalled <code>\check@icr</code> as check is
General: Replaced <code>\@</code> by	now done in <code>\check@nocorr@</code> (see
<code>\MessageBreak</code> , as suggested by	PR/2646). 491
Donald Arseneau. 386	1997-10-20 ltfinal.dtx v1.1a
1997-05-29 ltlogos.dtx v1.1f	<code>\@uclclist</code> : Removed <code>\aa</code> and <code>\AA</code>
<code>\LaTeXe</code> : Added <code>\m@th</code> so that the	from <code>\@uclclist</code> as these are
$\text{\LaTeX} 2_{\epsilon}$ logo works with non-zero	macros. 898
values of <code>\mathsurround</code> 259	1997-10-21 ltdefns.dtx v1.2z1
1997-06-16 ltdirchk.dtx v1.0v	<code>\renewcommand</code> : Use
General: documentation improvements	<code>\begingroup</code> / <code>\endgroup</code> rather
mainly from internal/2520 1	than braces for grouping, to avoid
1997-06-16 ltfloat.dtx v1.1s	generating empty math atom. 75
General: documentation fixes 679	1997-10-21 ltfssbas.dtx v3.0t
1997-06-16 ltfntcmd.dtx v3.3v	<code>\define@newfont</code> : Move
General: Fix typo in documentation. 489	<code>\makeatletter</code> to
1997-08-05 ltoutenc.dtx v1.9e	<code>\nfss@catcodes</code> 349
General: Corrected order of arguments	
in <code>\UseTextSymbol</code> example. 281	

<code>\nfss@catcodes</code> : Moved	Removed default settings, see next section.	307
<code>\makeatletter</code> from		
<code>\try@load@font@shape</code>	1997-12-19 ltoutenc.dtx v1.9i	
1997-11-09 ltoutput.dtx v1.2c	General: Documentation corrections.	280
<code>\@specialoutput</code> : Remove incorrect code: only one <code>\@emptycol</code> is needed here	1997-12-20 fontdef.dtx v2.2s	
	General: Added documentation . . .	467
<code>\@topnewpage</code> : Documentation of <code>vsize</code> check enhanced	1997-12-31 ltoutenc.dtx v1.9k	
	General: Further correction	281
1997-11-13 ltfssdcl.dtx v3.0f	1998-01-12 ltoutenc.dtx v1.9k	
<code>\DeclareSymbolFont</code> : (DPC) Really update <code>\group@list</code> don't leave new version in <code>\toks@. latex/2661</code>	General: Added <code>\ProvidesPackage</code> for <code>textcomp.sty</code>	280
	Adding missing braces and <code>\ushape</code>	309
<code>\stepcounter</code> : (DPC) Remove as never used. (Re)defined in <code>ltxcounts</code>	1998-01-16 ltoutenc.dtx v1.9m	
	General: fixed decimal codes. <code>latex/2734</code>	305
1997-11-19 ltfloat.dtx v1.1t	1998-03-04 ltdefns.dtx v1.2z2	
<code>\@footnotetext</code> : Missing percent, again	<code>\@xargdef</code> : Unnecessary <code>\expandafter</code> removed: <code>pr/2758</code> .	73
1997-11-19 ltoutput.dtx v1.2d	1998-03-05 ltoutenc.dtx v1.9n	
<code>\@vtryfc</code> : Reindent code, to be understandable(DPC).	General: Added masc/fem ords as in <code>pr/2579</code>	294
1997-11-20 ltfssdcl.dtx v3.0g	1998-03-20 ltdefns.dtx v1.2z3	
<code>\document@select@group</code> : (DPC) inline use of <code>\stepcounter</code> (faster, and saves a <code>cname</code> per math version as no reset list)	<code>\@thirdofthree</code> : Macro added	78
	1998-03-20 ltoutenc.dtx v1.9o	
<code>\select@group</code> : (DPC) inline use of <code>\stepcounter</code> (faster, and saves a <code>cname</code> per math version as no reset list)	General: Documentation added about order of decls	283
	Documentation added for <code>pr/2783</code> .	282
1997-11-23 ltoutenc.dtx v1.9g	<code>\UndeclareTextCommand</code> : Macro added for <code>pr/2783</code>	291
General: Use <code>\textperthousand</code> , <code>\textpertenthousand</code> and <code>\textfractionsolidus</code> not <code>\textpermill</code> , <code>\textpertenmill</code> and <code>\textfraction</code> . /2673	1998-03-20 lttextcomp.dtx v1.9o	
	General: Added various <code>\UndeclareTextCommand</code> declarations for <code>pr/2783</code>	527
1997-12-17 ltoutenc.dtx v1.9h	Load decls after defaults for speed. .	527
General: Added <code>\textperthousand</code> and <code>\textpertenthousand</code> .	1998-03-21 ltclass.dtx v1.0z	
Added code for <code>textcomp.sty</code>	General: Added to documentation of <code>filecontents</code>	714
Added section.	1998-03-21 ltclass.dtx v1.1a	
Added <code>textcomp.sty</code>	<code>\@providesfile</code> : Allow <code>&</code> . <code>Internal/2702</code>	727
As in OT1, Added <code>\leavevmode</code> at start of <code>\c</code> , otherwise the output routine might be invoked within the macro.	General: Correct to new <code>onlypreamble</code> command list	761
	1998-03-25 ltfssbas.dtx v3.0u	
Changed to decimal codes in <code>\ooalign</code>	<code>\showhyphens</code> : Suppress unnecessary error when used in preamble . . .	359
Changed to decimal codes.	1998-04-11 fontdef.dtx v2.2t	
Documentation changes and additions.	General: Added <code>\mathring</code> accent (<code>pr2785</code>)	481
Example corrected, braces removed.	1998-04-15 fontdef.dtx v2.2u	
	General: Use new syntax for <code>\DeclareMathDelimiter</code>	474

2000-09-01 <code>ltfinal.dtx</code> v1.1d		2001-06-05 <code>ltoutenc.dtx</code> v1.94	
<code>\errhelp</code> : Set error help empty at very end (pr/449 done correctly). .	900	General: Text composite Commands need kludges for ‘,’ – see <code>tlb1903.lvt</code>	298
2000-09-24 <code>ltfloat.dtx</code> v1.2b		2001-08-26 <code>ltclass.dtx</code> v1.1f	
<code>\end@dblfloat</code> : FMI: use output routine to defer float	687	<code>\@providesfile</code> : Readdded setting of space char (pr/3353)	727
2000-09-24 <code>ltoutput.dtx</code> v1.2b		2002-02-24 <code>ltplain.dtx</code> v1.1x	
<code>\docclearpage</code> : FMI: ensure <code>\docclearpage</code> is called again until all floats are output.	833	<code>\loggingall</code> : Macro added	31
2000-09-24 <code>ltoutput.dtx</code> v1.2n		<code>\loggingoutput</code> : Macro added	31
<code>\addtocurcol</code> : FMI: test for wide float was in wrong place	851	<code>\showoutput</code> : Use newly added <code>\loggingoutput</code>	31
2001-01-07 <code>ltoutput.dtx</code> v1.2j		<code>\tracingall</code> : Use newly added <code>\loggingoutput</code>	31
<code>\@writeseup</code> : And do it in the right macro (pr/3286)	839	2002-06-16 <code>ltoutenc.dtx</code> v1.95	
2001-02-16 <code>ltxref.dtx</code> v1.1k		General: Added <code>\textbardbl</code> (pr/3400)	304
<code>\@newl@bel</code> : Added an extra <code>grouplevel</code> (PR3250), jlb	534	Added default for <code>\textbardbl</code> (pr/3400)	293
2001-05-25 <code>ltclass.dtx</code> v1.1d		2002-06-17 <code>ltoutenc.dtx</code> v1.95	
<code>\@providesfile</code> : Explicitly set catcode of <code>\endlinechar</code> to 10		General: Corrected <code>\c</code> for T1 (pr/3442)	299
		Definition of <code>\textexclamdown</code> changed (pr/3368)	297

Definition of <code>\textquestiondown</code> changed (pr/3368)	297	2004-01-04 ltbibl.dtx v1.1p <code>\nocite</code> : Changed error message . . .	708
2002-06-18 ltoutenc.dtx v1.95 General: Changed def for <code>\textregistered</code> to avoid small caps (pr/3420)	294	2004-01-04 ltoutenc.dtx v1.99c General: More adjustments for ogonek (pr/3532)	299
2002-10-01 ltfloat.dtx v1.1v <code>\thempfootnote</code> : Use braces around <code>\itshape</code> to keep font change local (pr/3460).	696	2004-01-23 ltdefns.dtx v1.1g <code>\@newenva</code> : Use kernel version of <code>\@ifnextchar</code> (pr/3501)	76
2002-10-02 ltffsbas.dtx v3.0x <code>\DeclareFontSubstitution</code> : Adding <code>\LastDeclaredEncoding</code> introduced a bug as on some occasions that macro name was stored in the internal lists instead of the actual encoding. (pr/3459)	340	<code>\@testopt</code> : Use kernel version of <code>\@ifnextchar</code> (pr/3501)	73
2002-10-28 ltlists.dtx v1.0s <code>\endtrivlist</code> : Check for math mode (pr/3437)	582	<code>\@xargdef</code> : Use kernel version of <code>\@ifnextchar</code> (pr/3501)	73
2002-10-28 ltoutenc.dtx v1.96 General: coding change, to follow bug fix by DEK in plain.tex (pr/3469)	297, 306	<code>\@xdblarg</code> : Use kernel version of <code>\@ifnextchar</code> (pr/3501)	95
2002-12-13 ltbibl.dtx v1.1n <code>\@citex</code> : Added <code>\leavevmode</code> in case citation is at start of paragraph (pr/3486)	706	2004-01-23 ltdefns.dtx v1.3g <code>\kernel@ifnextchar</code> : Added macro (pr/3501)	94
2003-01-01 ltfntcmd.dtx v3.3z General: Code checked and documentation extended by Chris	491	2004-01-28 ltclass.dtx v1.1g <code>\@providesfile</code> : Use kernel version of <code>\@ifnextchar</code> (pr/3501)	727
2003-05-18 ltbibl.dtx v1.1o <code>\nocite</code> : Check if we are after <code>\document</code>	708	2004-01-28 ltvers.dtx v1.0k General: Check for old format made 5 years (pr/3601)	34
2003-08-27 ltpictur.dtx v1.1k <code>\@bezier</code> : added missing displacement pr/3566	659	2004-02-02 fontdef.dtx v2.3 General: Many things from here on made robust	479
<code>\@sline</code> : check for <code>\@linechar</code> being empty pr/3570	640	2004-02-02 ltoutenc.dtx v1.99 General: Added <code>\textbigcircle</code> . . .	304
2003-10-13 ltfinal.dtx v1.1e General: Added extra <code>\lccode</code> for <code>\-</code> and <code>\textcompwordmark</code>	891	2004-02-04 fontdef.dtx v2.3a General: Added bigtriangle synonyms for stmaryrd	477
2003-12-16 ltoutput.dtx v1.2k <code>\@makecol</code> : Ensure that <code>\@elt</code> has a defined state (pr/3586)	835	2004-02-04 ltspc.dtx v1.3 <code>\nobreakdashes</code> : (Macro added . . .	255
2003-12-30 ltpictur.dtx v1.1j <code>\@getcirc</code> : issue warning if circle size can't be met pr/3473	651	2004-02-06 ltoutenc.dtx v1.99d <code>\@inmathwarn</code> : New command added to fix severe bug: pr/3563	284
2004-01-03 ltoutenc.dtx v1.99b General: Added <code>\textogonekcentered</code> (pr/3532)	299	2004-02-07 ltoutput.dtx v1.2l <code>\@doclearpage</code> : Empty kludgeins box if necessary, pr/3528	833
Added composites for <code>\k</code> (pr/3532)	304	2004-02-13 ltoutenc.dtx v1.99e General: Documentation fixes: typos . . .	280
Use <code>\ooalign</code> for <code>\k</code> (pr/3532)	299	2004-02-15 ltbibl.dtx v1.1q <code>\@cite@ofmt</code> : Added hook with default value <code>\hbox</code>	709
		<code>\@citex</code> : Changed to use a hook with default value <code>\hbox</code>	707
		2004-02-15 ltspc.dtx v1.3a <code>\nobreakdashes</code> : (Added spacefactor setting	255
		2004-10-20 ltoutput.dtx v1.2m <code>\@makecol</code> : Removed dead code . . .	835
		2005-07-27 ltssdcl.dtx v3.0j <code>\DeclareMathAlphabet</code> : (MH) Make document commands robust . . .	425

<code>\DeclareSymbolFontAlphabet:</code> (MH) Make document commands robust	438	<code>\t@st@ic:</code> Use switch <code>\ifmaybe@ic</code> instead of <code>\if@tempswa</code>	495
<code>\new@mathalphabet:</code> (MH) Make document commands robust	426	2010-08-17 ltmiscen.dtx v1.1k <code>\enddocument:</code> Use braces around <code>\input arg (pr/4124)</code>	539
<code>\non@alpherr:</code> (MH) Change because command is now properly robust	418	2010-08-17 ltmiscen.dtx v1.1l <code>\enddocument:</code> Change of plan: use <code>\@@input</code> instead (pr/4124)	539
<code>\SetMathAlphabet:</code> (MH) Make document commands robust	427	2011-05-08 ltfssdcl.dtx v3.0n <code>\in@:</code> Simplified thanks to Bruno.	414
2005-09-27 ltoutenc.dtx v1.99g General: Replace <code>\sh@ft</code> by <code>\ltx@sh@ft</code>	296, 299, 306	2011-08-19 ltclass.dtx v1.1i <code>\ifclasswith:</code> Re-jig definition after more stringent <code>\in@</code> test.	724
2005-09-27 ltplain.dtx v1.1y <code>\ltx@sh@ft:</code> New macro	30	2011-09-03 ltfssdcl.dtx v3.0o <code>\new@mathversion:</code> (Will) Remove <code>\global</code> before <code>\newcount</code> (unnecessary and caused etex bug).	422
<code>\sh@ft:</code> Macro no longer used but left for compatibility	30	2012-01-20 ltplain.dtx v2.0b <code>\loggingall:</code> etex tracing if available	31
2005-11-08 ltoutenc.dtx v1.99h General: Added <code>\ij</code> and <code>\IJ</code> from babel. (pr/3771)	293, 298, 300	2013-07-07 ltclass.dtx v1.1i General: Correctly describe how the date in <code>\ifpackagelater</code> is used	717
2005-11-10 ltmath.dtx v1.1g <code>\l:</code> (MH) Fixed potential problem in <code>\l</code> (pr/3399).	565	2014-04-18 ltoutput.dtx v1.1o General: Handle infinite glue from <code>\enlargethispage</code> (pr/4023)	879
General: (MH) Minor documentation fixes.	558	2014-04-24 ltoutput.dtx v1.2n <code>\fl@tracemessage:</code> Renamed internal trace commands; provide as package	869
2006-05-18 ltboxes.dtx v1.1g <code>\@parboxto:</code> Ensure <code>\@parboxto</code> holds the value of <code>\@tempdima</code> not the register itself (pr/3867)	598	2014-04-27 ltfloating.dtx v1.2b <code>\end@dblfloat:</code> Inline the code to allow some coexistence with packages that hook into <code>\end@float</code> and do not know about the algorithm change	687
2006-09-13 ltoutput.dtx v1.1m General: Ensure that rule is in <code>\normalcolor</code>	879	2014-06-10 ltfloating.dtx v1.2b <code>\end@dblfloat:</code> missing <code>\fi</code> added	687
2007-08-05 ltclass.dtx v1.1h <code>\@fileswithoptions:</code> Prevent loss of brackets PR/3965	735	2014-12-30 ltfinal.dtx v2.0a <code>\newmarks:</code> macro added	886
2007-08-06 ltctrl.dtx v1.0h <code>\@fornoop:</code> Really make defs long	227	<code>\newXeTeXintercharclass:</code> macro added	886
2007-08-31 ltfssdcl.dtx v3.0l <code>\SetSymbolFont@:</code> Font warning changed to info for encoding change (pr/3975)	424	2014-12-30 ltfloating.dtx v1.2a <code>\@textsubscript:</code> Command added (latexrelease)	698
2009-09-24 ltvers.dtx v1.0l General: Stop checking for old format	34	<code>\textsubscript:</code> Command added (latexrelease)	697
2009-10-20 ltfssdcl.dtx v3.0m <code>\in@:</code> More robust thanks to Heiko.	414	2014-12-30 ltfssbas.dtx v3.0y <code>\mathgroup:</code> move allocation to ltplain.	336
2009-10-28 lttextcomp.dtx v1.99k General: Added Latin Modern and TeX Gyre subsets	529	2014-12-30 ltoutput.dtx v1.2m General: Command updated (latexrelease)	878
2009-11-04 lttextcomp.dtx v1.99l General: Added more Latin Modern and TeX Gyre subsets	529		
2009-12-14 ltfntcmd.dtx v3.4a <code>\ifmaybe@ic:</code> Macro added	494		
<code>\maybe@ic@:</code> Use switch <code>\ifmaybe@ic</code> instead of <code>\if@tempswa</code>	494		

2014-12-30 ltplain.dtx v2.0a	2015-01-11 ltcounts.dtx v1.1h
<code>\e@alloc</code> : macro added 19	<code>\TextOrMath</code> : Add command to solve
<code>\e@alloc@chardef</code> : macro added . . . 18	robustness issues (pr/3752)
<code>\e@alloc@top</code> : macro added 18	(latexrelease) 332
<code>\e@ch@ck</code> : macro added 19	2015-01-11 ltfloat.dtx v1.2b
<code>\extrafloats</code> : macro added 20	<code>\dblfloatplacement</code> : float order in
<code>\newlanguage</code> : New engine-specific	2-column (latexrelease) 689
allocation scheme (latexrelease) . . 17	<code>\xfloat</code> : Check for valid option
2014-12-30 ltspace.dtx v1.3b	(latexrelease) 683
<code>\@</code> : <code>\@</code> discards spaces when moving	<code>\end@dblfloat</code> : float order in
(pr3039)(latexrelease) 256	2-column (latexrelease) 687
2015-01-03 ltdefs.dtx v1.4a	2015-01-11 ltfssbas.dtx v3.0y
<code>\typein</code> : use modified definition in	<code>\DeclareMathSizes</code> : Allow arbitrary
luatex 71	units (latexrelease) 343
2015-01-03 ltdirchk.dtx v1.1	2015-01-11 ltspace.dtx v1.3d
General: Enable extra primitives when	<code>\Esphack</code> : Allow hyphenation
LuaTeX is used 3	(Donald Arseneau pr/3498)
2015-01-03 ltfinal.dtx v2.0a	(latexrelease) 249
General: Skip resetting codes with	<code>\esphack</code> : Allow hyphenation
Unicode engines 897	(Donald Arseneau pr/3498)
Unicode data loading added 888	(latexrelease) 248
2015-01-07 ltvers.dtx v1.0n	2015-01-14 ltoutput.dtx v1.2n
<code>\IncludeInRelease</code> : macro added . . 36	<code>\addtocurcol</code> : float order in
2015-01-08 ltboxes.dtx v1.1h	2-column (latexrelease) 850
<code>\framebox</code> : Make Robust	<code>\addtodblcol</code> : float order in
(latexrelease) 596	2-column (latexrelease) 861
<code>\makebox</code> : Make Robust (latexrelease) 590	<code>\addtonextcol</code> : float order in
<code>\parbox</code> : Make Robust (latexrelease) 597	2-column (latexrelease) 857
<code>\raisebox</code> : Make Robust	<code>\docclearpage</code> : Empty kludgeins box
(latexrelease) 602	if necessary, pr/3528 832
<code>\rule</code> : Make Robust (latexrelease) . 602	float order in 2-column
<code>\savebox</code> : Make Robust (latexrelease) 593	(latexrelease) 832
2015-01-08 ltdefs.dtx v1.4a	<code>\startdblcolumn</code> : float order in
<code>\MakeRobust</code> : Added macro 81	2-column (latexrelease) 844
2015-01-08 ltlength.dtx v1.1c	<code>\xtryfc</code> : float order in 2-column
<code>\setlength</code> : to ensure first length	(latexrelease) 846
argument is terminated.	<code>\ztryfc</code> : float order in 2-column
(latexrelease) 334	(latexrelease) 847
2015-01-08 ltmath.dtx v1.1h	2015-01-14 ltspace.dtx v1.3e
<code>\)</code> : Make Robust (latexrelease) . . . 565	<code>\addpenalty</code> : Avoid adding redundant
<code>\]</code> : Make Robust (latexrelease) . . . 565	skips (DPC) 252
2015-01-09 ltfssini.dtx v3.1a	2015-01-17 ltvers.dtx v1.0m
<code>\em</code> : Allow <code>\emph</code> to produce small	<code>\IncludeInRelease</code> : modified with
caps (latexrelease) 458	<code>\@currname</code> 36
<code>\eminnershape</code> : macro added	2015-01-19 ltvers.dtx v1.0o
(latexrelease) 458	<code>\IncludeInRelease</code> : Optional
2015-01-09 ltspace.dtx v1.1h	argument 36
<code>\addpenalty</code> : Donald Arseneau's fix	2015-01-20 ltoutput.dtx v1.2m
from PR/377703 (latexrelease) . . 252	<code>\fl@tracemessage</code> : Reset
2015-01-10 ltcounts.dtx v1.1h	<code>\IncludeInRelease</code> flags 870
<code>\@fnsymbol</code> : Unse <code>\TextOrMath</code>	2015-01-22 ltvers.dtx v1.0p
(latexrelease) 331	General: Preserve any <code>\everyjob</code>
<code>\@stpelt</code> : Reset all within counters in	material inserted by a loader (<code>.ini</code>
one go (latexrelease) 328	file) 35

2015-01-23 ltfinal.dtx v2.0b	2015-02-21 ltvers.dtx v1.0r
<code>\newmarks</code> : use reserved count 256 . . . 886	General: Removed autoload code . . . 34
<code>\newXeTeXintercharclass</code> : use	2015-02-21 ltvers.dtx v1.0w
reserved count 257 886	<code>\IncludeInRelease</code> : set <code>\@currname</code>
2015-01-23 ltplain.dtx v2.0c	empty here (in case
<code>\extrafloats</code> : reserve counts 256–265 20	<code>\IncludeInRelease</code> input early) . 35
2015-01-24 ltfinal.dtx v2.0c	2015-02-22 ltfsscmp.dtx v3.0e
General: Skip T1-code entirely with	General: Moved all code into
Unicode engines 888	<code>latexrelease</code> - obsolete commands
2015-02-03 ltfinal.dtx v2.0d	are no longer automatically part of
General: Set <code>\lccode</code> for – with	the kernel 409
Unicode engines 889	2015-03-02 ltplain.dtx v2.0f
2015-02-16 ltoutenc.dtx v1.99m	<code>\e@mathgroup@top</code> : macro added . . . 19
General: Added <code>\textcommabelow</code>	<code>\newlanguage</code> : allow 255 math groups
<code>latex/4414</code> 295	in Unicode engines 17
2015-02-16 ltoutenc.dtx v1.99n	2015-03-10 ltplain.dtx v2.0g
General: Added <code>\textcommaabove</code> . . 296	<code>\hideoutput</code> : macro added 32
Added composites for <code>ç</code> 304	<code>\loggingall</code> : Reorganize to be less
Added composites for <code>\c</code> 298	noisy 31
2015-02-16 lttextcomp.dtx v1.99m	<code>\tracingnone</code> : macro added 32
General: Added <code>lmtt</code> (Heiko Oberdiek)	2015-03-12 ltoutput.dtx v1.2m
<code>latex/4415</code> 529	General: initialise <code>\@dbldeferlist</code>
2015-02-19 ltvers.dtx v1.0q	again 822
<code>\IncludeInRelease</code> : Swap argument	2015-03-18 ltfssdcl.dtx v3.0q
order 36	<code>\DeclareSymbolFont</code> : Restrict Symbol
2015-02-20 ltplain.dtx v2.0d	fonts to 0–15 423
<code>\loggingall</code> : Spell commands	<code>\document@select@group</code> : Introduce
correctly :-) 31	<code>\e@mathgroup@top</code> 419
2015-02-21 ltdefs.dtx v1.4b	<code>\select@group</code> : Introduce
General: Removed autoload support . 69	<code>\e@mathgroup@top</code> 417
2015-02-21 lterror.dtx v1.2o	2015-03-26 ltfinal.dtx v2.0d
General: Removed autoload support 228	General: Use renamed
2015-02-21 ltfiles.dtx v1.1m	<code>unicode-letters.def</code> 888
General: Removed autoload support 260	2015-04-07 ltfssbas.dtx v3.1a
2015-02-21 ltfssbas.dtx v3.0z	<code>\wrong@fontshape</code> : Try loading fd file
General: Removed autoload code . . 336	if family has changed 354
2015-02-21 ltfsscmp.dtx v3.0d	2015-04-28 ltfinal.dtx v2.0f
General: Removed autoload code . . 409	<code>\newXeTeXintercharclass</code> : define
2015-02-21 ltfssdcl.dtx v3.0p	<code>\xe@alloc@intercharclass</code> for
General: Removed autoload code . . 414	compatibility with older xelatex
2015-02-21 ltfssstrc.dtx v3.0k	initialization 886
General: Removed autoload code . . 384	2015-05-10 ltlists.dtx v1.0t
2015-02-21 ltoutenc.dtx v1.99m	<code>\@doendpe</code> : Explicitly reset
General: Removed autoload code . . 280	<code>\clubpenalty</code> before clearing
2015-02-21 ltoutput.dtx v1.2n	<code>\everypar</code> ; see also pr/0462 and
General: Removed autoload code . . 811	pr/4065 583
<code>\f@depth</code> : macro added(<code>latexrelease</code>) 831	2015-06-19 ltfinal.dtx v2.0g
2015-02-21 ltpictur.dtx v1.1k	<code>\e@alloc@intercharclass@top</code> : Use
General: Removed autoload code . . 630	–1 for first range to get contiguous
2015-02-21 ltplain.dtx v2.0e	allocation 887
General: Removed autoload code . . . 14	<code>\newmarks</code> : Use –1 for first range to
2015-02-21 lttab.dtx v1.1n	get contiguous allocation 886
General: Removed autoload code . . 605	

2015-06-19 ltplain.dtx v2.0h		
General: delete spurious old definition		
of <code>\newtoks</code>	23	
<code>\e@alloc</code> : extra braces in case		
arguments not single token	19	
<code>\newlanguage</code> : Use <code>—1</code> for first range		
to get contiguous allocation	17	
2015-06-23 ltfinal.dtx v2.0h		
General: set <code>\patch@level</code> in ltvers		
rather than in ltfinal/ltpatch	899	
2015-06-23 ltvers.dtx v1.0t		
General: set <code>\patch@level</code> in ltvers		
rather than in ltfinal/ltpatch	34	
2015-08-06 ltplain.dtx v2.0i		
<code>\extrafloats</code> : Add <code>\string</code> in case		
argument is not an unexpandable		
primitive	20	
2015-08-23 ltdirchk.dtx v1.2		
General: Do not use luatex prefix	3	
2015-08-23 ltvers.dtx v1.0v		
General: Allow negative patchlevel for		
pre-release	35	
2015-08-30 ltplain.dtx v2.1a		
<code>\newinsert</code> : new <code>\newinsert</code>		
implementation	22	
2015-09-205 ltoutput.dtx v1.3a		
General: extended <code>\@freelist</code>	821	
2015-09-24 ltluatex.dtx v1.0a		
<code>call_callback</code> : Function added	60	
<code>callback.register</code> : Function		
modified	57	
<code>callback_descriptions</code> : Function		
added	63	
<code>\catcodetable@atletter</code> : Macro		
added	45

2020-11-24 <code>ltshipout.dtx</code> v1.0d		<code>\selectfont</code> : Execute delayed series and shape updates (gh/444)	388
General: Support for roll forward (gh/434)	807	2021-01-07 <code>ltfilehook.dtx</code> v1.0e	
<code>\AtBeginDvi</code> : Support for roll forward (gh/434)	806	General: Added rollback for this case to avoid spurious errors (part of gh/463)	781
2020-11-25 <code>ltdefns.dtx</code> v1.5o		<code>\unqu@tefilef@und</code> : Restore <code>\CurrentFile(Path)(Used)</code> after the input (gh/464)	771
<code>\@carcube</code> : Added missing <code>latexrelease</code> entry	72	2021-01-07 <code>lthooks.dtx</code> v1.0h	
2020-12-02 <code>ltluatex.dtx</code> v1.1s		<code>__hook_strip_double_slash:w</code> : Assume hook name has at least three nonempty parts (gh/464)	194
General: Fix return value of list callbacks	58	<code>__hook_tl_set:cx</code> : Manually define some <code>l3tl</code> commands to work around <code>expl3</code> changes	185
2020-12-03 <code>ltfstrc.dtx</code> v3.0m		2021-01-08 <code>ltshipout.dtx</code> v1.0f	
<code>\selectfont</code> : Install a hook in <code>\selectfont</code> (gh/444)	389	<code>__shipout_execute_cont::</code> Added another kernel hook for more flexibility (cf https://github.com/pgf-tikz/pgf/issues/960)	793
2020-12-04 <code>ltfilehook.dtx</code> v1.0d		2021-01-10 <code>ltshipout.dtx</code> v1.0g	
<code>\undeclare@file@substitution</code> : Don’t drop file substitution commands on rollback	774	<code>\@kernel@after@shipout@background</code> : Internal hook <code>\@kernel@after@shipout@background</code> added	797
2020-12-04 <code>ltfssaxes.dtx</code> v1.0h			
General: Reorganized the rollback data	363		
<code>\fontseries</code> : Distangle series and shape update (gh/444)	372		
<code>\fontshape</code> : Distangle series and shape update (gh/444)	380		
<code>\fontshapeforce</code> : Distangle series and shape update (gh/444)	380		

<code>\RawShipout</code> : Macro added	797	<code>\par</code> in support for paragraph tagging	601
2021-01-19 ltshipout.dtx v1.0h		2021-02-10 ltfloat.dtx v1.2e	
<code>__shipout_run_firstpage_hook::</code> : Handling of firstpage hook altered	797	<code>\@footnotetext</code> : Explicitly run <code>\par</code> at the end of footnote text in preparation for paragraph hooks	698
2021-01-21 ltclass.dtx v1.3w		2021-02-115 ltssdcl.dtx v3.0w	
<code>\@kernel@currpathstack</code> : Add empty entry for latexrelease	721	<code>\document@select@group</code> : fix for (gh/501)	419
2021-01-21 ltexpl.dtx v1.3a		2021-02-16 ltfloat.dtx v1.2f	
General: Move xparse rollback code to <code>ltcmd.dtx</code>	68	<code>\footref</code> : <code>\footref</code> added	700
2021-01-21 ltfinal.dtx v2.2l		2021-02-17 ltoutenc.dtx v2.0t	
General: Load glyphtounicode.tex for pdfTeX	892	General: Adjust values for <code>\textasteriskcentered</code> To match TS1 definition (gh/502)	317
2021-01-22 ltshipout.dtx v1.0i		Special definition for <code>\textasteriskcentered</code> when missing in TS1 (gh/502)	308
<code>__shipout_finalize_box::</code> Add <code>pre_shipout_filter</code> Lua callback	792	2021-02-18 ltclass.dtx v1.3x	
2021-01-24 ltexpl.dtx v1.3a		<code>\@fileswithoptions</code> : save raw class option list (gh/85)	735
General: Define <code>expl3</code> hooks conditionally	65	<code>\@remove@eq@value</code> : macro added (gh/85)	729
2021-01-31 ltfilehook.dtx v1.0f		<code>\@use@option</code> : value from unused option list (gh/85)	731
<code>\@curr@file@reqd</code> : set <code>\protect</code> to <code>\string</code> gh/481	774	<code>\OptionNotUsed</code> : value from unused option list (gh/85)	729
2021-02-03 ltfloat.dtx v1.2e		<code>\PassOptionsToClass</code> : save raw option lists (gh/85)	727
<code>\@savemarbox</code> : Explicitly end with <code>\par</code> (gh/489)	692	2021-02-19 ltoutenc.dtx v2.0u	
2021-02-04 ltboxes.dtx v1.4b		General: Add <code>\textnonbreakinghyphen</code> , <code>\textfiguredash</code> and <code>\texthorizontalbar</code> (gh/404)	297, 301, 316
<code>\color@endbox</code> : Always add the color groups (gh/488)	593	2021-02-25 ltfinal.dtx v2.2m	
2021-02-08 ltfilehook.dtx v1.0g		General: Improve speed of ToUnicode everyjob loading code	892
<code>\unqu@tefilef@und</code> : Undo the internal for robust <code>\InputIfFileExists</code> in rollback (gh/494)	772		
2021-02-08 ltmiscen.dtx v1.1y			
<code>\end</code> : Undo the internals for robust <code>\begin</code> and <code>\end</code> in rollback (gh/494)	548		
2021-02-10 ltboxes.dtx v1.4b			
<code>\@mpfootnotetext</code> : Explicitly run			

Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.
